Imports.—The value of imports, both from Austria and other countries, was, in the same year, 68,514,437 florins, or £6,851,443. Foreign countries, it must be added, enter only for one fourth of this intercourse, the rest belongs entirely to the Austrian dominions. Since the end of the late war the custom-duties between Hungary and Austria have been abolished. In how far this change has hitherto affected the commerce of the former, would, in consequence of its abnormal political state, be difficult to decipher, even if the requisite data had been made public. As difficult would it be to form a sure estimate of the revenue and expenditure of Hungary since the late war, as both rest on momentary arbitrary measures undertaken either as precautions against revolution or in consequence of the periodical sickness of the Austrian finances. Ample data, however, are extant as to the public revenue and expenditure of Hungary before 1848. The chief sources of revenue up to that date were—the house-tax, war-tax, the toll duties, the crown and fiscal domains, and salt revenues, which, with the minor sources of income, such as the lottery, the post-office, and the mines, yielded, according to Fenyecs, £3,400,000, a sum less than that of Lombardy, but more than sufficient to cover public expenses, in consequence of the internal organization of the counties, where the salaries of the constitutional officials were but nominal. In the new régime a not unimportant item in the public revenue is the tobacco monopoly introduced into the Hungarian dominions by an imperial edict of November, 1850. By this edict no one may cultivate tobacco, except by previous permission, specifying the place and mode of cultivation, each owner being obliged to deliver up his produce to the government, which determines its value. The monopoly in itself, no less than the domiciliary visits to which it gave rise, greatly injured this thriving branch of Hungarian industry. A great many, indeed, have in consequence of this given up its cultivation, dispensing even with its use.—E. B.

For commerce of Hungary, see HUNT'S *Mag.*, xxi., 191 (CASSALI); DE BOW'S *Review*, xiii., 433; *Races of Hungary*; *Nor. Am. Rev.*, lxx., and lxxii.; *Ch. Exam.*, xlviii., 44.

Huron, Lake, one of the five great lakes of North America, lies between Lake Superior on the north-west, Lake Michigan on the west, and Lake Erie and Lake Ontario on the south and south-east: Its shape is so irregular that it is difficult accurately to determine its exact dimensions. Its length from north to south is 260 miles, and 160 miles in breadth from east to west, in its widest part, but exclusive of the bay on the north-east, it is only 90, and its circumference 1100 miles. Its principal indentations are Saginaw Bay, extending into Michigan, and two others; one immediately north of Manitou Islands, and the other south-east of them. The latter, called Georgian Bay, is about 170 miles long, by 70 broad; almost a separate sheet of water, divided from Huron by a nearly continuous series of islands which are closely connected by the great peninsula of Cabot's Head, and with Point de Tour, the easternmost cape of northern Michigan. Manitou (or Great Spirit) Island is the largest of the group, and Drummond Island separates another sheet of water from the main lake, 80 miles long and 20 broad. The boundary between the United States and Canada passes along the middle of the main Huron 225 miles, and between Lesser Manitou and Drummond Islands, by what is called the Middle Passage, and curves round to the north and west 25 miles, to the entrance of St. Mary's river. The elevation of the surface of Lake Huron above the surface of the ocean is 574 feet, or less than that of Lake Superior by 53 feet, or than that of Lake Michigan by 4 feet.

The greatest depth toward its west shore is at least 1000 feet, and its mean depth 900 feet, or about 800 feet below the level of the Atlantic. See LAKES.

Hurricane (Sp. *Huracan*), a violent storm, generally accompanied by thunder and lightning, and distinguished from every other kind of tempest by the vehemence of the wind, and the sudden changes to which it is subject. Hurricanes prevail chiefly in the East and West Indies, the Isle of France, and in some parts of China. The following graphic description of the usual phenomena attending the West Indian hurricanes, from the pen of Edmund Burke, may be interesting to the reader: "It is in the rainy season, principally in the month of August, more rarely in July and September, that they are assailed by hurricanes, the most terrible calamity to which they are subject from the climate. This destroys at one stroke the labor of many years, and frustrates the most exalted hopes of the planter, and often just at the moment when he thinks himself out of the reach of fortune. It is a sudden and violent storm of wind, rain, thunder, and lightning, attended with a furious swelling of the sea, and sometimes with an earthquake; in short, with every circumstance which the elements can assemble that is terrible and destructive. First they see, as a prelude to the ensuing havoc, whole fields of sugar-canes whirled into the air, and scattered over the face of the country. The strongest trees of the forest are torn up by the roots and driven about like stubble. Their wind-mills are swept away in a moment. Their works, their fixtures, the ponderous copper boilers and stills of several hundred weight, are wrenched from the ground and battered to pieces. Their houses are no protection; the roofs are torn off at one blast, while the rain, which in an hour rises 5 feet, rushes in upon them with an irresistible violence. There are signs which the Indians of these islands taught our planters, by which they can prognosticate the approach of a hurricane. It comes on either in the quarters, or at the full or change of the moon. If it will come on at the full moon, you being at the change, observe these signs. That day you will see the sky very turbulent. You will observe the sky more red than at other times. You will perceive a dead calm, and the hills clear of all those clouds and mists which usually hover about them. In the clefts of the earth, and in the wells, you will hear a hollow, rumbling sound, like the rushing of a great wind. At night the stars seem much larger than usual, and surrounded with a sort of burs. The north-west sky has a sort of menacing look, and the sea emits a strong smell, and rises into vast waves, often without any wind. The wind itself now forsakes its usually steady easterly stream, and shifts about to the west, from whence it sometimes blows with intermissions violently and irregularly for about two hours at a time. You have the same signs at the full of the moon. The moon itself is surrounded with a great bur, and sometimes the sun has the same appearance."

Hydrographical Charts or Maps, usually called sea-charts, are projections of some part of the sea or coast for the use of navigation. In these, are laid down all the rhumbs or points of the compass, the meridians, parallels, etc., with the coasts, capes, islands, rocks, shoals, shallows, etc., in their proper places and proportions.

Hydrography, the art of measuring and describing the sea, rivers, canals, lakes and the like. With regard to the sea, it gives an account of its tides, countertides, soundings, bays, gulfs, creeks, and also of the rocks, shelves, sands, shallows, promontories, and harbors; the distance and bearing of one port from another, with every thing that is remarkable, whether out at sea or on the coast.

I.

Ice. The sale of ice and snow preserved in the caverns of Vesuvius and on the more elevated parts of Ætna, has long been a considerable branch of trade in Naples, Catania, and the adjoining towns; but it was reserved for the Americans to carry the trade in ice to an extent which could not previously have been anticipated. The extreme heat of the summer in the New England States occasions a natural demand for ice, which the extreme cold of the winter gives the means of supplying. The fresh water lakes adjoining Boston and other large towns being deeply frozen in winter, large ice-houses are filled with the ice taken from them, which is retailed in summer at a low price. The practice had not, however, been long established till it occurred to some ingenious speculators to attempt to realize a profit by shipping ice to the southern parts of the Union and the West Indies: and the speculation having succeeded, the trade was subsequently extended to the Spanish Main and South America, and more recently to Europe, India, and China! The business has, in fact, become of the first importance; numerous companies and a very large amount of tonnage being now engaged in the ice trade from Boston. And owing to the greater skill and economy with which the business is at present conducted, the ice which used a few years ago to cost 6 cents per lb. in New Orleans and Havana, may now be had for 1 cent; and there has been a like fall in its price in India and other more distant places. An immense warehouse has recently been constructed at Calcutta for the reception of the ice brought by the ships, whence it is supplied in the quantities required for the public accommodation. This singular fabric has triple walls, five distinct roofs, incloses about three fourths of an acre, and is fitted to hold upward of 30,000 tons of ice! It is said that a similar dépôt is about to be formed at Canton.

The Ice Trade of the United States.—The ice trade of the United States was commenced by Mr. Frederic Tudor, of Boston, in 1805. This gentleman, having previously sent agents to the West Indies to procure information, determined to make his first experiment in that region. Finding no one willing to receive so strange an article on shipboard, he was compelled to purchase a vessel, the brig *Favorite*, of about 130 tons, which he loaded with ice from a pond in Saugus, Massachusetts, belonging to his father, and sent to St. Pierre, Martinique. This first enterprise resulted in a loss of about \$4500, but was, nevertheless, followed up until the embargo and war put an end to the foreign trade, at which period it had yielded no profit to its projector. Its operations had been confined to Martinique and Jamaica. After the close of the war with England in 1815, Mr. Tudor recommenced his operations by shipments to Havana under a contract with the government of Cuba, which enabled him to pursue his undertaking without loss, and extend it, in 1817, to Charleston, South Carolina; in the following year to Savannah, Georgia; and in 1820, to New Orleans. In the mean time it had been tried again (by other parties) at Martinique and St. Thomas, and failed, and by Mr. Tudor at St. Jago de Cuba, where it also failed, after a trial of three years.

On the 18th May, 1833, the first shipment of ice was made to the East Indies by Mr. Tudor in the ship *Tuscany*, for Calcutta, and since that period he has extended his operations to Madras and Bombay. Previously to 1832 the trade had been chiefly confined to the operations of the original projector, although several enterprises had been undertaken by other persons, and abandoned. The increase of shipments to this period had been small, the whole amounting, in 1832,

to 4,352 tons, which was taken entirely from Fresh Pond, in Cambridge, and shipped by Mr. Tudor, who was then alone in the trade. Up to this time the ice business was of a very complicated nature. Ship-owners objected to receive it on freight, fearing its effect on the durability of their vessels and the safety of voyages; ice-houses at home and abroad were required, and the proper mode of constructing them was to be ascertained. The best modes of preparing ships to receive cargoes were the subject of expensive and almost endless experiments. The machines to cut and prepare ice for shipping and storing, and to perform the operations of hoisting it into store-houses and lowering it into the holds of vessels, were all to be invented, involving much expense and vexation. Many of these difficulties have now been overcome, and since 1832 the trade has increased much, and appears destined to a still more rapid increase for some years. It has also been divided among many parties, and its methods have been further improved, and a knowledge of them more widely diffused.

The ice has been chiefly taken from Fresh and Spy Ponds, and since 1841 mainly transported on the Charlestown Branch Railroad, which was constructed for that purpose. Quite recently, ice establishments have been made at most of the ponds near Boston, and it is probable that in a few years the products of all these waters may be required to supply the trade. In the year 1839 the great quantity of ice cut at Fresh Pond, and the consequent difficulties which had arisen among the proprietors, as to where each should take ice, induced them to agree to distinct boundary lines, which were settled by three commissioners, viz., Simon Greenleaf, Levi Farwell, and S. M. Felton, esquires, on the principle of giving to each the same proportion of contiguous surface of the lake, as the length of his shore-line was to its whole border. This settlement was made by partition deed, executed by all the owners, and recorded in the registry of deeds of Middlesex county. Published maps were also placed in public institutions and private hands. These maps show the direction and length of the boundary lines of each owner, and the area. This arrangement has been of great advantage to the parties, and enabled them to secure more ice than could otherwise be taken from a pond of equal extent.

The shipments of ice from Boston coastwise for the year ending December 31st, 1847, amounted to 51,887 tons. The ice shipped to foreign ports during the same period amounted to 22,591 tons, and was sent to the following places, viz.; Havana, Matanzas, Trinidad, St. Jago, Cuba, Martinique, St. Thomas, St. John's, Mayaguez, Porto Rico, Guadaloupe, Barbadoes, Trinidad, Antigua, St. Vincent, Nassau, Jamaica, Pernambuco, Demerara, Honduras, Vera Cruz, Rio de Janeiro, Mauritius, Isle of Bourbon, Manilla, Calcutta, Madras, Bombay, Ceylon, Hong Kong, Whampoa, Batavia, and Liverpool.

The freight paid during this year is supposed to have averaged as high as \$2 50 per ton, at which rate it would amount, on the 74,478 tons shipped abroad and coastwise, to \$186,195. There is a great variation in the cost of securing ice and stowing it on board vessels, caused by winters favorable or otherwise for securing it, and by the greater or less expense of the fittings required for voyages of different duration, or by difference of season when the shipments are made. Taking all these contingencies into consideration, the cost of ice when stowed on board may be estimated to average \$2 per ton, which would give for the quantity shipped \$148,956. There were in 1847 upward of 29 cargoes of provisions, fruits, and vegetables shipped in

ice to ports where otherwise such articles could not be sent—say to Barbadoes, Trinidad, Demerara, Antigua, St. Vincent, Guadaloupe, St. Thomas, Honduras, and Calcutta—the invoiced cost of which at Boston would average about \$2500 each, \$72,500. To these items may be added the profits of the trade to those engaged in it, \$100,000. Total returns, \$507,651.

The ice trade has been without doubt one of the main stays which preserved the Calcutta trade almost exclusively to Boston, and it would do so for China if that country were in a more quiet condition. The freights paid to India by Mr. Tudor for ice amount to from 10 to 15 per cent. of the earnings for the whole run of the ship out and home, and it is earned without cost or deduction to the charterer or ship-owner.

It is probable that the commercial marine of the United States has been materially increased by the operation of the ice trade. A large portion of the vessels formerly engaged in the freighting trade from Boston sailed in ballast, depending for remuneration on freights of cotton, rice, tobacco, sugar, etc., to be obtained in more southern latitudes, often competing with the vessels of other nations which could earn a freight out and home. Now a small outward freight from Boston can usually be obtained for the transportation of ice to those places where freighting vessels ordinarily obtain cargoes. The ice trade has generally been unsuccessful to places where profitable return freights can not be obtained, because to such places a heavy freight must be paid on the ice, which it can not bear; and also because southern places which do not produce valuable exports, are usually unable to consume expensive luxuries.

The methods and materials for preparing vessels for the transportation of ice have been various. Formerly their holds were sealed up at the sides, bottom, and top, with boards nailed to joist ribs secured to the skin of the vessel, and with double bulkheads forward and aft. The spaces thus formed were filled with refuse tan, rice-hulls, meadow-hay, straw, wood-shavings, or like materials. These spaces were made of a thickness proportionate to the length of the voyage, and with reference to the season. The immediate surface of the ice was covered with the same materials, excepting tan. At the present time saw-dust is used almost exclusively for voyages of considerable length. It is placed immediately between the ice and the skin of the vessel. This material is obtained from the State of Maine, and before its use for this purpose was entirely wasted at the water-mills, and, falling into the streams, occasioned serious obstructions. During the year 1847, 4600 cords were brought to Boston, at an average value of \$2 50 per cord, delivered. The lumber is also wholly from the State of Maine. The value of it is, however, small, in the present mode of fitting vessels. Almost the whole value of the returns of the ice trade, including freight, is a gain to this country. The ice itself, the labor expended on it, the materials for its preservation, and the means of its transportation, would be worthless if the trade did not exist. The prices at which ice sells in places where there is competition vary constantly. In Havana, where it is a monopoly, it is sold at 6½ cents per pound, and there the trade has not increased since 1832, when the shipments were 1112 tons, while at New Orleans, where it has been sold at from half a cent to three cents per pound, it has increased during the same period from 2310 tons to upward of 28,000. At Calcutta the trade commenced, in 1833, with a shipment for that year of 201 tons, and the price has never been above 6 cents per pound, and is now about 2½ cents. The export to that place had increased in 1847 to 3000 tons, but probably less than one fifth of that quantity is actually sold, owing to the great length of the voyage.

Ice being shipped and used at all seasons, large storehouses are required to preserve it. Exclusive of ice-houses on the wharves at East Charlestown and

East Boston, in which ice is stored for short periods, there had been erected in 1847, and previously:

	Tons.
At Fresh Pond, in Cambridge, ice-houses capable of containing.....	86,782
At Spy Pond, in West Cambridge.....	28,000
At Little Pond " ".....	2,400
At Wenham Pond.....	13,000
At Medford Pond.....	4,000
At Eel Pond, in Malden.....	2,000
At Horn Pond, in Woburn.....	4,000
At Sumner's Pond.....	1,200
Total.....	141,382

The ice-houses now in use are built above ground. In southern countries, where ice is most valuable, they are constructed at great expense, usually of brick or stone, and the protection to the ice consists in air spaces, or in dry, light vegetable substances inclosed between two walls. In this vicinity, on the borders of the lakes, where ice is least valuable, they are usually built of wood, in which case they are of two walls, formed by placing two ranges of joists upright, framed into plates at the top, and placed in the ground at the bottom, or framed into sills; these two ranges are ceiled with boards secured to that side of each range which is nearest the other, and the space between the two boardings filled with refuse tan wet from the yards. This wet tan is frozen during the winter, and until it is thawed in the spring and summer, little waste occurs; afterward the waste is more rapid, but, as a large portion of the ice is shipped or otherwise used before this takes place, the loss in quantity is small, and, occurring before the expenses of transportation have been paid, is of less pecuniary moment.

In one instance, brick has been used in the construction of an ice-house which covers 36,000 feet of land, and the vaults of this ice-house are 40 feet in depth, and its walls are four feet thick from outside to inside, inclosing two sets of air-spaces. Such a construction is more costly, but has the advantage of durability and safety from fire, to which ice-houses are much exposed from the frequent juxtaposition of railroad-engines, and the light, dry material used about them to cover and otherwise preserve ice. At first, the implements of husbandry only were used in securing ice, but as the trade became more important, other machines and different methods were adopted, and abandoned when better were brought forward, or when the increased magnitude of the business required greater facilities. More ice is now secured in one favorable day than would have supplied the whole trade in 1832. Ordinarily, before there has been cold enough to form ice of suitable thickness, snow falls on its surface. If this occurs when the ice is four or more inches in thickness, and the snow not heavy enough to sink the ice, it can be removed by using horses attached to the "snow-scraper;" and under such circumstances this is the method in common use. But if snow falls so heavy as to bring the water above the surface of the ice, it is removed, after it has congealed into snow-ice, with the "ice-plane," which takes off about two inches deep and 22 inches wide of its surface. This machine is drawn by two horses, and is guided by inserting its "guides" into grooves previously made with the "ice-cutter." The chips made by it are scraped off in the same manner as dry snow. These preliminary expenses are often very great; frequently, after much expense has been incurred to remove a body of snow or snow-ice, the weather becomes warm and spoils the ice on which so much has been expended. And, on the other hand, if it is not done and the cold continues, there will be little or no increase of thickness to the ice, which is equally a disaster.

When ice has been formed of sufficient thickness, and freed from snow and snow-ice, it is reduced to blocks of uniform size, ordinarily 22 inches square, by the "ice cutter." This machine is similar to a car-

pen's plow, except that it has a series of cutting-chisels, one succeeding another, and deepening the groove. It is drawn by a horse, and cuts at one passage about two inches deep, and if the ice requires to be planed to remove snow-ice, the guides of the "snow-plane" are used in grooves of this depth, but when grooves are required to split from, the "ice-cutter" should be drawn two or three times through each. These grooves should be parallel to each other, and to make them so, the "ice-cutter" has a guide, which is placed in the last groove made. When the grooves in one direction have been made, others at right angles with them are produced in the same manner. After this has been done, one groove at the end is opened, and also the two outside grooves; a wedging-bar is then stricken into the groove next the end one, and at several places along its length, which detaches it easily from the mass; then the same bar is forced, with a slight blow, into the transverse grooves, which reduces the ice to very uniform square blocks. The blocks of ice thus formed are brought to the receiving-doors of the ice-houses (which are built on the immediate borders of the ponds), either by placing them on sleds, or floating in canals cut through the ice. Various modes of elevating the ice are in use; the endless chain, in combination with the inclined plane, has been successfully used, and also the common pile-driving steam-engine; but at present horse-power is more used than any other. The ice is placed in the houses in regular courses, every block exactly covering the next below it. When a vault has been filled, it is immediately covered with wood-shavings and the receiving-doors fitted up, to prevent waste, until the contents are required for shipment abroad or use at home. The weight of ice for shipment is usually determined at the wharves, immediately before being put on shipboard, on scales which have been constructed for the purpose; and this single operation settles the weight to be paid for by the party for whose account the ice is shipped; the amount due for freight on shipboard, for transportation on the railroad, and that which is to be received by the owner of the ice.—*American Almanac, year 1849.*

The aggregate of freights paid for ice shipped in Boston in 1856, was \$2 50 the ton, clean and clear to the ship-owner; therefore he received from this trade last year \$365,000 (a large interest), and probably more profit than any other interest whatever in the business. Railroads and wagons were paid \$100,000; laborers, \$160,000; towns, for taxes of ice privileges and ice in store, \$1500; and wharves \$20,000 to \$25,000. There are 93 wagons and about 150 horses employed in distributing ice in Boston and vicinity; 60,000 tons are thus retailed, supplying 18,000 families, hotels, stores, and factories.

The tons of ice prepared for market, its value, capital invested, and number of persons employed in this business in Massachusetts, in the year 1855, are shown in the annexed summary:

Counties.	Tons prepared for market.	Value annually.	Capital invested.	Hands employed.
Bristol.....	16,200	\$10,000	\$16,000	10
Essex.....	13,900	76,200	25,000	65
Middlesex.....	366,200	550,400	660,700	362
Plymouth.....	800	2,500	3,000	8
Total.....	397,100	\$639,100	\$704,700	445

The annual domestic consumption of ice in the chief cities of the United States is estimated as follows:

Tons.	Tons.
Boston..... 60,000	Charleston..... 15,000
New York..... 300,000	Mobile..... 15,000
Philadelphia..... 200,000	New Orleans..... 40,000
Baltimore..... 45,000	St. Louis..... 25,000
Washington..... 20,000	Cincinnati..... 25,000

In the smaller towns, especially in those where water is introduced by reservoirs, the consumption of ice is about two thirds as great in proportion to their population as in the larger cities.

New York, up to this time, has exported but little ice, being chiefly engaged in procuring an amount sufficient for its domestic supply. New York city and vicinity is, for the most part, supplied with ice by four or five joint-stock companies. The amount of ice placed in storage for the winter of 1856-7, by these various companies, is estimated as follows:

	Tons.
Knickerbocker Ice Co.....	250,000
New York and Brooklyn Co.....	40,000
People's Co.....	20,000
Independent Co.....	20,000
Passaic Co.....	7,000
Total.....	387,000

The Knickerbocker Company, which engrosses a large proportion of the business, is a consolidation of three separate concerns into one company, with a capital of \$300,000. Its supply of ice is derived from Rockland and Highland lakes. The New York and Brooklyn Company obtains its supply from the Hudson River at Athens; the Independent from the same place; the People's from the same river at Catskill; and the Passaic from the reservoir at Jersey City.

Export Trade.—The export of ice during the year 1856, from Boston, has been as follows:

	Tons.		Tons.
East Indies.....	14,380	Port Spain.....	704
Peru.....	1,194	Pernambuco.....	257
Callao.....	6,744	Martinique.....	211
Melbourne, Australia.....	596	South America.....	375
Sydney, N. S. W.....	520	Cuba.....	314
Valparaiso.....	614	Bahia.....	375
Guyana.....	1,028	Porto Rico.....	181
Ceylon.....	467	Masanilla.....	57
Rio Janeiro.....	1,762	Nassau, N. P.....	180
Havana.....	5,801	Remedios.....	10
Demerara.....	1,100	Bermuda.....	40
Montevideo.....	898	Rio Hache.....	10
Kingston, Ja.....	1,594	Southern ports.....	81,895
Aspinwall.....	557		
Cardenas.....	422	Total, 1856.....	125,814
St. Thomas.....	778	" 1855.....	98,080
Buenos Ayres.....	530	" 1854.....	115,315
Brazil.....	43	" 1853.....	82,792
Barbadoes.....	877	" 1852.....	96,482
St. Jago.....	445	" 1851.....	99,787
Matanzas.....	605	" 1850.....	99,623
New Granada.....	390	" 1849.....	66,308
Laguaira.....	218	" 1848.....	57,507
Porto Cabello.....	50	" 1847.....	54,625

The total capital invested in the ice business is \$700,000, and the total quantity gathered 397,000 tons, about one third only of which is exported.

EXPORTS OF ICE FROM THE UNITED STATES, FOR EACH YEAR ENDING JUNE 30TH, 1853, 1854, AND 1855.

Countries.	1853.	1854.	1855.
	Value.	Value.	Tons.

From this statement it would appear that the British East Indies absorb the largest quantity of ice from this region. Cuba next, and Peru the third in import-

ance. At present the aggregate is very trifling, but as fast as the article becomes known in southern climates, it will be more appreciated, and will become a permanent article of export from Boston, where the shipments are principally made. For Ice-houses, see CAREY'S *Mus.*, xii., 175. Ice Trade, etc., see HUNT'S *Mag.*, v., 444, xi., 877; *Jour. of Sci.*, iii., 179, ix., 136, xlvii., 179, xlviii., 373; *Bankers' Mag.*, iii., 406; *Am. Elec.*, iii., 307, 512 (LOUIS AGASSIZ), iv. i.

Icebergs. The accumulation upon elevated situations of frozen snow, produces those moving masses of ice called *glaciers*. In the Alps, and in Norway, these glaciers coming down to a mild region melt away; but in the arctic regions, they often flow into the sea and produce icebergs. While floating about, these masses may increase indefinitely in size, from receiving fresh accessions of snow, or by the freezing of the water continually splashed against them, as well as by the sudden freezing of the water which falls as rain. They are of all sizes, from mere fragments to upward of half a mile in diameter, and of all weights, from a few pounds to 100,000 tons. They rise sometimes 150 feet above the water, and this is but an eighth of the whole mass. They float about in hundreds, and are often driven by winds far into the ocean, and become exceedingly dangerous to navigation. Icebergs from each pole have approached nearer the equator than 40° north and south latitude; they have been met with in the neighborhood of the Cape of Good Hope. Many of these icebergs originating on land, present the same phenomena as glaciers. Hence, upon near inspection, they are found to be loaded with the debris which, as glaciers, they scraped off the mountain sides, past which they flowed to the sea. This debris contains masses of greenstone, clay-slate, gneiss, granite, etc. In the polar circle, where the floating masses reach to many hundreds of miles in length, they are called *ice islands*. When two of these approach each other, any vessel which happens to be between them is almost certain to be crushed to pieces. The larger of the two, by its greater momentum, urges itself beneath the smaller, which is thus tilted up on the shoulders of the larger, whose mass it goes to increase. The *iceblink* is an appearance produced on the horizon by these ice islands when stationary, and which indicates the existence of an ice-island before it is itself visible.

Ice-boats, boats so constructed as to sail upon ice, and which are very common in Holland. They go with incredible swiftness, sometimes so quickly as to affect the breath, and are found very useful in conveying goods and passengers across lakes and great rivers. Boats of different sizes are placed in a traverse form upon a 2½ or 3 inch deal board. At the extremity of each end are fixed irons, which turn up in the form of skates. Upon this plank the boat rests, and the two ends serve as outriggers to prevent oversetting, whence ropes are fastened that lead to the head of the mast in the nature of shrouds, and others passed through a block across the bowsprit. The rudder is made somewhat like a hatchet with the head placed downward, which being pressed down, cuts the ice, and serves all the purposes of a rudder in the water, by enabling the helmsman to steer.

Ice Islands, a name given by sailors to a great quantity of ice collected into one huge solid mass, and floating about the seas near or within the polar circles. The motion of the lesser pieces is as rapid as the currents; the greater, which are sometimes 200 leagues long, and 60 or 80 broad, move slowly and majestically; often fix by the tide, immovable by the power of the ocean, and then produce near the horizon that bright white appearance called the *iceblink*. The approximation of two great fields produces a most singular phenomenon; it forces the lesser (if the term can be applied to pieces of several acres square), out of the water, and adds it to the surface:

a second and often a third succeeds, so that the whole forms an aggregate of a tremendous weight. These float in the sea like so many rugged mountains, and are sometimes 500 or 600 yards thick; but the far greater part is concealed beneath the water. These are continually increased in height by the freezing of the spray of the sea, or the melting of the snow which falls on them. Those which remain in this frozen climate receive continual additions; others are gradually wafted by the northern winds into southern latitudes, and melt by degrees by the heat of the sun, till they waste away, or disappear in the boundless element.

Iceland, one of the largest islands in Europe (being little inferior, in point of superficial extent, to Ireland), is situated in the north part of the Atlantic Ocean, between N. lat. 63° 23' 30", and 66° 32'; and W. long. 13° 32' 14", and 24° 34' 14"; the north point being thus very near to the arctic circle, but not passing beyond it, as all maps but a recent authoritative one have represented it. Its extreme length from east to west is about 280 miles, and its breadth from north to south varies from 180 to 200 miles.

The precise period at which this island was discovered and first colonized is unknown; but from the *Landnamabok*, an ancient Icelandic chronicle, and a work generally relied upon as authentic, we learn that the Norwegians were the first settlers upon its coasts. Naddodr, a famous pirate of that adventurous nation, was, on his return to the Faroe Islands from a predatory excursion, about the year 860, driven by a tempest upon the coast of Iceland. He ascended to the summit of a mountain, but observing around him neither the vestige of a human residence, nor aught else than vast and trackless fields of snow, he immediately abandoned it. Probably aware of this discovery, Gardar Svarfason, a Swede, followed the same track a few years afterward, and succeeding in circumnavigating the country, discovered it to be an island. He there spent the winter; but finding little inducement to make it a permanent residence, he, in the following spring, returned to Norway. The third adventurer on this coast was one Floki, another celebrated Norwegian pirate, who, during the two seasons, explored a considerable portion of the southern and western coasts. His attempt at forming a permanent settlement proved, however, like that of his predecessors, a failure; his cattle died, his expected crops were ruined, and, after experiencing innumerable distresses and hardships from the inclemency of the weather, he determined to repair to a warmer region, and gave to the island at his departure the name by which it has ever since been known. That this name, and the report which he spread on his return of the inhospitable nature of the island, were principally the effect of prejudice and disappointment, is evident from the contradictory account given of it by his companions, one of whom thought he could only convey an adequate idea of its richness and fertility by declaring that butter dropped from every plant.

The ancient Icelanders possessed, as is still the case with their posterity, few of the luxuries or refinements of life; and were occasionally exposed to severe privations, from the nature of their soil, and the climate under which they lived. There is reason, however, to believe, though the fact can not with perfect accuracy be ascertained, that the climate of Iceland was once less austere than it now is; and that not only trees and shrubs, but even corn, were grown upon the island. Of the ancient existence of the former, the trunks occasionally discovered in the bogs afford pretty satisfactory evidence. Grain of any description is not now a native of this island; and a few birches, not rising much more than a yard in height, afford the only approach toward timber. Like the present inhabitants, the ancient Icelanders were much dispersed over the country, their habitations being seldom

grouped together, but placed wherever the situation and nature of the soil appeared suitable. Their occupations and modes of life appear also to have borne much similitude. The produce of the farm, and the capture of fish, afforded them, as they do the present inhabitants, the principal means of subsistence; and their traffic with foreign countries made a valuable addition to their domestic comforts.

Population.—The population of Iceland has undergone considerable vicissitudes through the operation of epidemics. At 50,444 in 1703, it had sunk, in 1769, to 46,201, nor did it rise much above this point throughout the remainder of the century. In 1850 it was 59,157. This is small for an island whose surface is to that of Ireland as four to five; but that surface, both from its own nature, and the character of the climate, is perhaps as unfavorable as any which exists between the limits of the two arctic circles. Deducting the areas of the numerous fiords with which it is intersected, the square contents of the land may be calculated at 37,388 statute miles: but as the centre of the island consists entirely of snowy and uninhabited mountains, the peopled portion can not be considered more than 25,000 square miles; and the population therefore will not much exceed two persons to each square mile. At present the population must be increasing with great rapidity, if we may judge from the proportion of births to deaths, the respective numbers in 1852 being 2435 (of which 333 were illegitimate) and 1437. The whole population is employed either in farming, which occupies about three fourths of the men, or in fishing. Other employments do not exist, nor is there any other class of people or townsmen, save the small number of merchants in Reikiavik and the other trading establishments. Every branch of industry is therefore domestic, and confined chiefly to articles of clothing, such as coarse cloth, gloves, mittens, and stockings. The peasantry are generally ingenious, and manufacture such simple pieces of furniture as their cottages require; some also aspire to make trinkets of silver, and articles from the walrus' tusks. The trade of Iceland has never, till the present time, been managed in what modern science points out as the most advantageous way. The Danish government long had a monopoly of the business of this remote dependency. For many years, while this was abolished, Danish merchants had a preference to trading, by virtue of higher duties exacted from those of other countries. It was not until 1856 that the foreign merchant was encouraged to come to Iceland by a perfect equality of terms. The only place in the island entitled to be considered as a port is Reikiavik: only a few trading stations exist elsewhere. There is an annual export of from 1,000,000 to 1,200,000 pounds of raw wool, besides about 200,000 pairs of knitted stockings, and 300,000 mittens, or gloves without fingers. The Iceland sheep have remarkably fine fleeces of wool, which the farmers, in the spring of the year, take off whole; their weight being usually from four to five pounds. The other principal branch of industry in Iceland is fishing, which must be considered as in a thriving state. The fishing-banks around the island abound in cod and other species, and the number of boats engaged in the business in 1853 amounted to 3506, being an advance of nearly 50 per cent. in 20 years. Fish-oil, whale-blubber, skins, eider-down, feathers, and the *Lichen Islandicus*, for medicinal purposes, may also be included among their list of exports. These the natives dispose of to the Danish merchants in exchange for coffee, sugar, tobacco, snuff, a small quantity of brandy, rye and rye-bread, biscuit, wheaten flour, salt, soap, and such other small articles as are in constant use for domestic purposes. Those who can afford it, purchase a supply of linens and cottons, which of late years have become of more common use, and which must tend greatly to cleanliness, and the prevention of those diseases which wool-

on clothing worn next the skin tends to engender. The traffic thus occasioned takes place in the early part of summer, and while it lasts creates a kind of fair, with no little bustle and business in the capital. All the articles brought from the interior for sale at the sea-ports, and all those taken back for winter consumption, are transported on pack-horses. There is not, in fact, in all Iceland such a machine as a wheel-carriage; before any such can be used, there must be roads, of which, up to the present time, none exist. The lines of transit along the country are mere tracks, cut deep by use where the ground is soft, and encumbered by blocks where it is hard. Yet full as these paths are of difficulties, it is surprising at what a pace the small, hardy, sure-footed horses of the country will proceed. For foot traveling they are in general impracticable.

The revenue of the island, arising from crown property, commercial charges, a small tax on transference of property, etc., amounted in the year ending 31st March, 1854, to 29,949 rix-dollars (£3119), while the expenditure for officers' salaries, educating the clergy, and other items, was 56,743 rix-dollars, or more than double the income, the excess being supplied by the central government. The income, however, appears to be increasing in proportion.

The scanty produce of the land is, however, to a great degree compensated for by the abundance of fine fish which occurs on the coast. In several parts of the island, particularly on the north and north-west, the shark fishery is a regular occupation. Strong hooks fastened to chains are baited and anchored a little way out to sea, and the fish when caught are thus towed to shore. Of the skin, shoes are made; a considerable quantity of oil is extracted, and some parts of the flesh are occasionally smoked and used by the natives for food. The cod is very plentiful; the haddock grows to a large size; ling, skate, flounders, and halibut, are likewise very common; the herring, too, frequents the fiords in vast shoals, but this branch of the fishery has hitherto been little attended to. The salmon in the rivers are said to be very fine, and no country in the world produce them in greater quantity. Seals are particularly numerous on the shores of the Breide-fiord and the western coast. See *Ed. Rev.*, iii., 334 (SYDNEY SMITH), xix., 416; *Quar. Rev.*, liv., 185, xix., 291, vii., 43 (R. SOUTHEY); *Westm. Rev.*, lii., 264; *North Am. Rev.*, xxxv., 75 (O. W. B. PEABODY); *For. Quar.*, ix., 41.

Illinois, one of the United States, is bounded north by Wisconsin, east by Lake Michigan and Indiana, from which it is separated for a third of its length by the Wabash River, south by the Ohio, which separates it from Kentucky, and west by the Mississippi. It lies between N. lat. 37° and 42° 30', and between W. long. 87° 49' and 91° 28'. Greatest length from north to south 378 miles; greatest breadth, 212 miles; average breadth, 140 miles. Its area is estimated at 55,409 square miles, being only about 3000 square miles less than that of England and Wales. According to the census of 1850, little more than a sixth part of the State was under cultivation.

Illinois is one of the most level States in the Union. With the exception of a range of low hills in the south, and a good deal of broken land in the north-west, as well as a few elevations near the Illinois, and some lofty bluffs along the Mississippi, the State may be regarded as an extensive table-land, gently inclining toward the south-west. At the mouth of the Ohio the soil is only about 340 feet above tide-water in the Gulf of Mexico, and the highest elevation in the whole State does not exceed 800 feet above that standard. Its surface is occupied almost entirely by prairies, which are popularly distinguished by the names, "wet" and "dry," "alluvial" and "rolling." The wet prairies are peaty, indicating that they have once been morasses. Those of an alluvial nature are dry,

with a rich black loam, and exceedingly fertile. They are covered with a coarse kind of grass, which grows to an enormous size. The soil of the high and "rolling" prairies is, in general, only of second-rate quality, and abounds in springs. Grape-vines are abundant. The prairies furnish an inexhaustible summer range for cattle. From the exceeding flatness of some of the plains, the rains that fall are allowed to stagnate, and thus render the situation unhealthy. The Grand Prairie, which is the largest tract of this description, is probably the highest table-land between the Mississippi and the Wabash. It extends from the county of Jackson, in a north-east direction, to the Iroquois county, and varies in breadth from 1 to upward of 12 miles. Although passing under one name, it does not consist of one single tract of land, but is broken up into several reaches of prairie ground, with strips of wood running between them. It is rich and fertile, and several settlements have been located on its border, which is everywhere skirted with wood. The prairies, generally, are not plentifully supplied with timber, most of them being only interspersed with groups of trees, or skirted with strips of forest. Much of the young wood is destroyed by the annual winter burning of the coarse grass, which covers at least two thirds of the prairie land. In spring the prairies again become profusely decked with the greatest variety of beautiful and delicate flowers of every hue.

Illinois is distant from the sea, but is well provided with rivers. Nearly three fourths of its boundary is formed by navigable rivers; and on the north-east it has Lake Michigan for upward of 60 miles. The Mississippi, which forms its entire western, and the Ohio, which forms the southern boundary, give commercial access to those valleys which bear their names. The Wabash, a noble stream which bounds the State on the east for more than 100 miles, is navigable for more than that distance. For internal communication, the Illinois, which belongs entirely to this State, is navigable at all seasons for steamboats for 260 miles, to La Salle, where navigation is stopped occasionally by the little rapids, and where a canal branches off, connecting the river with Lake Michigan. The principal tributaries of the Illinois, which is itself formed by the junction of the Kankakee and the Des Plaines, are the Fox River, which rises in Huron Territory, and has a course of 200 miles before it joins the Illinois; the Vermillion River, which falls into it from the south-east; the Sangamon from the east, the Mackinaw from the north-east, and the Spoon River from the north-west. These are almost all navigable for considerable distances. The Sangamon is navigable for 140 miles. The Little Wabash and the Embarrass, which flow into the Wabash, are likewise navigable for upward of 150 miles. The Rock River, which rises in Wisconsin, and falls into the Mississippi, after a course of about 300 miles, is navigable for some distance, but its upper course is impeded by rapids.

The climate of Illinois, extending as it does over a space of $5\frac{1}{2}$ degrees of latitude, must necessarily be varied. The natural difference of temperature between the northern and the southern parts is, however, increased, by the numerous and large rivers which bound and intersect the country, and by its state of cultivation. Everywhere the winters are severe, the summers hot and long, and the temperature subject to frequent and sudden changes. In the southern parts of the State the summer heat is very oppressive and enervating; and is only occasionally relieved by fresh breezes from the prairies. In winter the snow falls to a considerable depth, and lies occasionally for three months; and many of the rivers remain frozen for the same length of time. In some parts of the State only a few inches of snow falls, and it quickly disappears.

Illinois possesses a vast extent of arable land. The soil, although varied, is generally highly productive, and for agriculture, it has been considered as unsurpassed by any State in the American confederacy. The soil in "the bottoms," or along the river valleys, such as those of the Rock River, the Sangamon, and Kaskaskia, consists chiefly of rich alluvial deposits, and is so productive as frequently to yield 40 bushels of wheat or 100 bushels of Indian corn to the acre. Nearly all the tracts adjacent to the rivers are of this character. "The American Bottom," as it is called, is the richest river alluvium, and has been cropped without deterioration for a century. It extends along the Mississippi for 90 miles; but in consequence of its liability to inundation, much of it is uncultivated. The prairies, although less productive, are still very fertile, and on account of their greater salubrity are preferred for farms, wherever wood is to be obtained. In 1850, there were 76,208 farms in Illinois, containing 5,039,545 acres of improved ground.

Important and valuable minerals abound in this State. Bituminous coal occurs in almost every county; and in some instances may be obtained without excavation. Vast beds are found on the bluffs adjacent to the "American Bottom;" and it has been reported that anthracite coal has been found in the county of Jackson. But the great coal region is an extensive tract which extends quite across the State from Missouri to Indiana, and from Iowa to Kentucky. Iron has been found in the southern part of the State, and is said to be plentiful in the northern. The great lead region is shared between Illinois, Iowa, and Wisconsin. Galena in the north-west is nearly supported by this mineral. Silver has also been found in the west part of the State, and copper is obtained in several places. The other minerals found here are, zinc, gypsum, quartz, crystals, etc.

Manufactures, etc.—There were in the State in 1850, 16 woolen factories, with a capital invested of \$154,500, employing 124 males and 54 females, manufacturing 806,995 yards of cloth, and 187,000 pounds of yarn valued at \$206,572; 2 establishments making pig iron, with a capital of 65,000, employing 150 persons, producing 2,700 tons of pig iron, etc., valued at \$70,200; 29 establishments with a capital of \$260,400, employing 382 persons, and making 4,160 tons of castings, etc., valued at \$441,185; 280 flouring and grist mills, 487 saw mills; 94 printing offices, 10 daily, 4 tri-weekly, 94 weekly, 2 semi-monthly, 7 monthly, and 1 quarterly publications. Total value of manufactured articles, \$5,200,000. There were in January, 1856, 2,215 miles of railroad in operation, and 1,945 miles in course of construction.

The internal trade of this State is becoming considerable, and increasing in proportion to the means of internal communication. Its direct foreign commerce is small, and is chiefly with Great Britain.

COMMERCE OF THE STATE OF ILLINOIS, FROM OCTOBER 1, 1847, TO JULY 1, 1856.

YEARS.	EXPORTS.		IMPORTS.	TONNAGE CLEARED.	
	Domestic.	Total.	Total.	American.	Foreign.
1847	\$52,100	\$52,100	\$266	1,202	350
1848	41,885	41,885	4,365	807
1849	88,412	88,412	9,766	914	2,796
1850	17,669	17,669	15,705
1851	114,886	114,886	4,657	2,088	215
1852	51,325	51,325	4,882	3,403	213
1853	79,139	79,139	7,559	2,288
1854	296,046	297,046	79,344	8,014	708
1855	547,083	547,083	54,509	81,464	2,916
1856	1,845,223	1,845,223	277,404	76,980	19,511

Illinois consist of 100 counties, which contain a number of thriving towns, many of which are increasing very fast in population. Chicago is much the largest, and has connected with it the greater part of the traffic of the State. Population in 1850, 29,963. In 1853 it is said to have increased to upward of 60,000. In 1856 the population was estimated at 100,000. The capital of the State is Springfield.

The following table shows the decennial increase of the population in the State since 1810:

Years.	Whites.	Free colored.	Slaves.	Total.
1810	11,501	618	168	12,282
1820	53,788	506	917	55,211
1830	155,061	1,637	747	157,445
1840	472,254	3,589	221	476,183
1850	846,104	6,866	None.	851,470

The astonishing growth of the State of Illinois and its promising condition, in 1855, may be seen from the following returns transmitted to the Auditor of the State:

Articles.	Number.	Value.
Horses.....	95,692	\$20,364,812
Neat cattle.....	1,175,888	14,619,529
Mules and asses.....	19,523	1,106,094
Sheep.....	811,827	1,044,181
Hogs.....	1,689,637	2,512,815
Carriages and wagons.....	198,654	4,756,459
Clocks and watches.....	124,494	743,244
Pianos.....	1,227	156,158
Merchandise.....		8,423,819
Bankers' property.....		2,515,534
Manufactured articles.....		884,951
Money and credits.....		14,871,840
Bonds, stocks, etc.....		600,840
Unenumerated property.....		22,908,937
Deductions.....		8,755,886
Personal property.....		95,927,285
Town lots.....		32,395,905
Lands.....		202,194,178

The progress which the State has made, even within a single year, may be seen from the following comparisons of totals for the last two years:

	Personal property.	Lands.	Personal property. Lands and lots.
1855. . .	\$95,927,285	\$202,194,170	\$334,398,425
1854. . .	79,545,958	121,451,894	252,756,568
Increase	\$16,381,282	\$79,742,845	\$51,641,857

Its internal improvements for some years past have been very great. Canals have been formed to compensate for the natural barriers to navigation in some of its rivers, and recently its great canal from Chicago to Peru, on the Illinois River, has been completed, uniting the waters of Lake Michigan with the Mississippi; thus opening direct communication between the whole of the Lake district in the north, and the river navigation on the south. The system of railroads, projected on a grand scale upward of 20 years ago, and which had been temporarily suspended, has been resumed some years ago on a still greater scale, and is being carried on with vigor. Chicago, its principal commercial city, is connected with Rockford, St. Charles, Aurora, Peru, and many other places within the State, and beyond it, either directly or indirectly, with Detroit, Cincinnati, New York, Philadelphia, and Boston. Besides these there were railroads uniting Springfield with Jacksonville, and Naples, Alton, and Quincy, with Columbus. When its railroads under construction are finished, Illinois will be surpassed for its railroad communication by but few States in the Union.

Immigration. *Progress and Extent of Immigration to the United States.*—We will review the progress and extent of immigration to the United States of America prior to 1819, the year in which the present official history begins. As, on this point, no authentic information exists, it must be determined by such evidence as statisticians of that period possessed, and by the relations then existing between the United States and the countries from which persons emigrated. The current of emigration commenced its flow from England, Ireland, and Scotland, and from Germany through the French and British ports. It was subject to many fluctuations during a part of this time, but continued with considerable uniformity, it is believed until 1806. Mr. Samuel Blodget, a statistician of more than ordinary research and accuracy, wrote in 1806, while every fact in regard to immigration was fresh in the minds of the people, that from "the best records and estimates at present attainable"

the immigrants arriving in the United States did not average, for the 10 years from 1784 to 1794, more than 4000 per annum. During 1794, 10,000 persons were estimated to have arrived in the United States from foreign countries. In 1818, Dr. Adam Seybert, member of the House of Representatives from Pennsylvania, in his exceedingly valuable "*Statistical Annals*" of the United States, wrote to the following effect: "Though we admit that 10,000 foreigners may have arrived in the United States in 1794, we can not allow that they did so, in an equal number, in any preceding or subsequent year until 1817;" and he assumes that 6000 persons arrived in the United States from foreign countries in each year from 1790 to 1810; to him, and to the authorities he consulted, this average seemed a generous one.—SEYBERT'S *Annals*, pp. 28, 29.

During the 10 years from 1806 to 1816, extensive immigration to the United States was precluded by the unfriendly relations at that time existing between Great Britain, France, and the United States. England maintained the doctrine, and, for a while enforced it with success, that "a man once a subject, was always a subject." This deterred many from emigrating to the United States from the British empire. Numbers had previously come for the purpose of entering the merchant-service, and numbers might still have come whom the fear of British impressment frightened from carrying out their design. Another influence retarded immigration: in 1806 Great Britain issued a decree declaring the coasts of France in a state of blockade. A retaliatory decree was, in November of the same year, issued by France declaring the British Isles in a state of blockade. To these restrictions on commerce, and, consequently, on the unobstructed passage from Europe, succeeded the British orders in council, and the Milan decree of Napoleon. In March, 1809, the United States' law was passed prohibiting, for one year, intercourse with Great Britain or France. In 1810, the Napoleonic decrees were annulled, and the commerce of the United States had, in 1811, fairly commenced with France, but only to have their vessels fall into the hands of the British. Preparations were now making for active hostilities, and, on the 18th of June, 1812, war was formally declared by the United States to exist with Great Britain.

The German emigration sensibly felt this unfavorable condition of affairs, inasmuch as the Germans embarked principally at the ports of Liverpool and Havre; facilities for migrating thence to this country being more numerous, and the expense of the voyage less onerous. Thus, from 1806, was the stream of emigration pent up at its fountain. In February, 1815, peace was concluded between the United States and Great Britain; and after several months requisite to restore tranquillity, and to secure the confidence of those desiring to leave the Old World, the tide returned to its flow, and, with a speed greatly accelerated; as, from authentic information, collected principally at the several custom-houses, it appears that, during the year 1817, not less than 22,240 persons arrived at ports of the United States from foreign countries. This number included American citizens returning from abroad.—SEYBERT'S *Annals*, p. 29. In no year previous to that had one half so many foreign passengers reached our shores. Many sufferings were incident to a voyage across the Atlantic in a crowded emigrant vessel; and there were no laws of the United States either limiting the number of persons which a passenger ship or vessel should be entitled to carry, or providing any measures for the health or accommodation of the passengers. The subject seemed to deserve the immediate attention of Congress. In 1818 (March 10), Mr. Louis M'Lane, of Delaware, reported to the House of Representatives a bill "regulating passenger ships and vessels," which was read twice and referred to a committee for inves-

tigation into the subject. In December, 1818, the subject was brought before Congress by Mr. Thomas Newton, of Virginia, who explained the necessity of its passage. It was read a third time and passed by the House. After receiving amendments from both the Senate and House, it was finally passed and approved March 2, 1819. In compliance with a requirement of this act, collectors of the customs have reported quarter-yearly to the Secretary of State the number of passengers arriving in their collection districts, by sea from foreign countries; also, the sex, age, and occupation of such passengers, and the country in which they were born. Annual reports embracing that information, have, in conformity with the same act, been communicated to Congress by the Secretary of State; and, as before indicated, from these reports chiefly, this historical sketch has been compiled. The country having the largest emigration is, doubtless, Ireland; for, in addition to the 747,930 persons arriving from the United Kingdom, known to have been born in Ireland, it is safe to assume that of the 1,348,682 others, born as indefinitely stated in "Great Britain and Ireland," arriving in the United States, 1,000,000 at least, were born in Ireland alone; thus making 1,747,930 as the total Irish emigration. See EMIGRATION.

Next in numerical order comes Germany; England, third; and France, fourth. The emigration of Chinese to this country, was very inconsiderable until 1854; previous to which year, the aggregate number known to have arrived was only 88. In that year, however, 13,100 came to the United States; and in 1855, 3526; all of whom, with the exception of a single passenger, landed at the port of San Francisco; 15,950 were males, and were designated in the returns of the collector as "laborers."

As regards passengers from British America, the fact may be deemed worthy of mention, that many of them, especially of those arriving during the last four years are known to have come with the intention of returning, and not of residing in the United States. The number of such can not, however, be determined. Finally, to the 4,212,624 passengers of foreign birth arriving in the United States since September 30, 1819, may be added 250,000 as the number of immigrants who arrived prior to that date; making the total foreign arrivals from the close of the Revolutionary War to December 31, 1855, 4,462,624.—BROMWELL'S *History of Immigration*. New York: 1856. To this large number may be added, as variously estimated, from 500,000 to 1,000,000, who emigrated to the western States through Canada.

TOTAL NUMBER OF PASSENGERS, DISTINGUISHING ALIENS FROM OTHERS, ARRIVING IN THE UNITED STATES BY SEA, FROM FOREIGN COUNTRIES, FROM SEPTEMBER 30, 1819, TO DECEMBER 31, 1856.

Legal Rights of Naturalized Citizens in the United States.—Aliens naturalized agreeably to the acts of Congress, are not prohibited by the Constitution of the United States, the enjoyment of the same rights, and to the same extent as natural-born citizens, with the single proviso that no person shall be eligible to the office of President or Vice-President, except a citizen native-born, or a citizen of the United States at the time of the adoption of the Federal Constitution. Congress can make no law to prohibit the free exercise of their religion; nor to abridge their freedom of speech. The right of security in their persons, houses, papers, and effects, against unreasonable searches and seizures, is not denied to them; nor are they prohib-

ited the purchase and occupation of lands owned by the government. The Constitutions of the several States concede to those naturalized citizens, who take up their residence within the States, in general the same rights as are enjoyed by persons born therein. Among these rights may be mentioned that of voting and of being elected to office. See EMIGRATION. BROMWELL'S *Sketch of Immigration*. See No. Am. Rev., xl., 457 (by A. H. EVERETT); Am. Whig Rev., vi., 455, 633, vii., 419 (by O. C. GARDINER); NILES'S *Register*, xiv., 380, xviii., 157. Upon the subject of German emigration, see No. Am. Rev., ii., 1 (by EDWARD EVERETT); xx., 191 (by J. SPARKS). Immigration to the United States, see DEBOW'S *Review*, v., 243,

Rev.*, liv., 215, xxxvii., 539, xxiii., 373; *Blackwood*, xv., 433, xx., 470, xxi., 377, xxiii., 191, 615, v., 523, vi., 78; *Knicker*, xvi., 589.

Importation and Exportation, the bringing of commodities from and sending them to other countries. A very large portion of the revenue of a commercial country is derived from customs duties, or from duties on commodities imported from abroad; and drawbacks being given on many, and bounties on a few, articles exported; the business of importation and exportation is subjected to various regulations which must be carefully observed by those who would avoid incurring penalties, and subjecting their property to confiscation. See articles **TARIFF** and **UNITED STATES** for the imports and exports of this country.

Impressment, the forcible taking away of seamen from their ordinary employment, and compelling them to serve, against their will, in national ships. See *Ed. Rev.*, xli., 154; *Westm. Rev.*, xx., 489; *Blackwood*, xx., 745.

Indemnity, is where one person secures another from responsibility against any particular event; thus a policy of insurance is a contract of indemnity against any particular loss. Where one person also becomes bail for another, a bond of indemnity is frequently executed; and where a bond or bill of exchange has been lost or mislaid, the acceptor or obligee would not act prudently in paying it, without being secured by a bond of indemnity.

India, or Hindoostan, has from the earliest ages been celebrated as one of the most highly-favored countries on the globe, and as abounding in the choicest productions both of nature and art. In ancient times, this distant region was very imperfectly known to the Greeks and other nations of the west; but they imported its most valuable produce, its diamonds, its aromatics, its silks, and its costly manufactures. The country which abounded in those expensive luxuries was naturally reputed to be the seat of immense riches, and every romantic tale of its felicity and glory was readily believed. In the middle ages an extensive commerce with India was still maintained through the ports of Egypt and the Red Sea; and its precious produce, imported into Europe by the merchants of Venice, confirmed the popular opinion of its high refinement and its vast wealth. After the discovery of a passage to India by the Cape of Good Hope, the same ideas still prevailed; and the maritime states of Europe contended with their fleets and armies for the dominion of the Asiatic seas, and for the commerce of the country. The Portuguese, and afterward the Dutch, made important conquests, and carried on an extensive trade. In later times, Great Britain and France appeared on the field as competitors for the prize of Indian commerce and dominion, and were allowed to establish factories on the coasts for the reception and the store of goods. These were gradually converted into military posts, defended by soldiers and cannon; and in due time those two powers were ranged on opposite sides in all the wars and politics of India. This contest terminated in the triumph of the British arms. France lost her pre-eminence on the continent of India; and her great rival, enlarging her powers on every side, gradually rose to greatness and dominion, and now rules with undisputed sway from the Himalaya Mountains to Cape Comorin. This vast extension of the British power in the East has opened the way into the interior of India. It has tended greatly to enlarge our knowledge of this distant region; and if more accurate inquiry has reduced the marvelous tales of its glory and greatness within the bounds of sobriety and truth, Hindoostan, the seat of industry, of commerce, and of the arts, when Europe was sunk in

barbarism, the scene of many eventful revolutions, from the Mohammed invasion till its conquest by the armies of Britain, and inhabited by a people of peculiar manners, laws, institutions, and religion, still presents a wide field for interesting inquiry and speculation.

In the following account of this interesting country, we propose to describe—I. Its geography and natural features; its produce, its animals, its manufactures, and commerce; the numerous races by which it is inhabited, with their manners, religion, and policy; and the wars and political revolutions which have terminated in establishing the sway of Great Britain over nearly the whole continent of India.

I. The ancient geographers had no precise ideas of the extent of Hindoostan or India, terms which we mean to use synonymously in the following article; and they accordingly extended its frontier westward as far as Persia, and eastward to China. In after ages its limits often fluctuated with the events of war, and served only to mark out the course of conquest, with little or no attention to geographical accuracy. Yet in no part of the earth has nature pointed out, in the great features of the country, more distinct and magnificent boundaries. On the north it is separated from the elevated table-land of Thibet by the precipitous wall of the Himalaya Mountains, the highest land of the Asiatic continent; on the west the Suliman range, a continuation of the Sufeid Koh Mountains, separates it from Afghanistan and Beloochistan; its east boundary is formed by parallel offshoots from the opposite extremity of the Himalayas, and by the continuous ranges of forest-covered hills, which, skirting the Bengal district of Chittagong, stretch southward to the recently-acquired province of Pegu, and separate the British dominions from the territory of Burmah. The Indus and the Ganges discharge themselves into the ocean on the western and eastern coasts of Hindoostan, in about north latitude 24° and 22° ; and to the south the country is contracted into an irregular triangle, projecting into the Indian Ocean to within eight degrees of the equator, or about 1000 miles, and on all sides inclosed by the sea. The extensive region situated within these limits is nearly comprehended between the 8th and 35th degrees of north latitude, and between the longitudes 66° and 99° east; and its length from the northern barrier of the Himalaya Mountains to Cape Comorin is about 1900, while in breadth it may be estimated at 1800 miles, though, owing to the irregularity of its figure, it does not exceed 1,484,367 English square miles.

Hindoostan is of an extremely diversified aspect, and comprehends within its bounds all the varieties of climate, of soil, and of natural scenery, from the bare and naked rock, and lofty mountain buried under eternal snows, to the low and fertile plain, scorched by the tropical sun, and the seat or luxuriant vegetation. This diversity in the aspect of the country has given rise to the following territorial divisions, namely: 1. Northern Hindoostan, which comprehends the Himalaya Mountains on the north, with their lower ranges of hills stretching southward to the plains of the Indus and the Ganges, and extending from Peshawur and Cashmere on the west, to Bootan and Assam on the east. 2. Hindoostan Proper which extends southward as far as the Nerbuddah River, where the Deccan commences, and which includes the lower provinces of Bengal, the north-western provinces, together with Oude, Malwa, or Central India, the Punjab, Guzerat, Sindh, and Cutch. 3. The Deccan, bounded on the north by the Nerbuddah River, and on the south by the Rivers Krishma and Toombudra, comprehends the larger portion of the presidency of Bombay, together with Orissa, the Nizam's dominions, and the territory of Nagpore. 4. India south of the Crishma River, comprehending the territories under the administration of the government of Madras, together with the native states of Cochin, Travancore, and the Mysore.

The Himalaya Mountains contain the sources of the great rivers which flow through the burning plains of Hindoostan. The deep valleys between the mountains are the channels through which the waters flow from the higher grounds; and, by the melting of the snow, those streams, suddenly swollen into torrents, and rushing down the declivity, work out a deep and narrow channel among the rocks, where, imprisoned as it were between steep and perpendicular rocks, they roar and foam amid precipices, or in dark and unfathomable glens, exhibiting, in the conflict of their troubled waters, all the great phenomena which belong to rivers, namely, the cataract, the rapid, the boiling eddy, and the dangerous whirlpool, and only subside into smoothness when they break out and spread over the plains. Huge rocks were seen by Dr. Gerard whirled along with frightful velocity; nothing visible but an entire sheet of foam and spray, thrown up and showered upon the surrounding rocks with loud concussion, and re-echoed from bank to bank with the noise of the loudest thunder. Across these streams are thrown rude bridges made of ropes or of wood, the usual expedient by which rivers are crossed in all mountain countries. Where the breadth of the river is small, the passage is effected by one or two fir spars laid across from rock to rock; but where the space is wider, a bridge of ropes is constructed, on the principle of the chain-bridge. In attempting the passage by one of these rude bridges, a carrier who accompanied Fraser in his journey to the sources of the Ganges unfortunately lost his footing and fell into the water. He was instantly swept down the stream to its junction with the Bhagiruttee, about 50 yards, "when his head," says the traveler, "appeared for a moment, and his load floating beside him; but the foaming current of the Bhagiruttee here tumbling over large rocks with a mighty roar, seized him and hurried him along with its tremendous torrent."

Northern Hindoostan varies in its climate and in its aspect with the height of the ground. The lower ranges of mountains, though they scarcely reach the level of perpetual snows, still retain the sublime features of alpine scenery; namely, the rugged and bare mountain, the craggy rock, white, gray, red, or brown, springing up in fantastic forms above the general mass; and the deep and suddenly descending chasm, with the foul torrent foaming over its rocky bed. The luxuriant foliage is wanting which embellishes the lower hills; the rich and smiling valley is not so often seen; while the forests of dark brown fir fringing the mountains and the hollows impart a sombre and unvarying appearance to the scene. At a lower level the country improves; and though it still exhibits the mountain and the precipice, the intervening valley is clothed with verdure, and the lower hills with the most magnificent forests of large and lofty trees, the open country with roses, jasmines, and other lovely or odoriferous shrubs, and with the most luxuriant alpine plants. The valleys through which flow the head waters of the Indus and the Ganges, namely, the Sutlej, the Pabur, the Jumna, the Bhagiruttee, the Alkananda, with their tributaries, exhibit all the varied and sublime scenery of this romantic country. The valley of the Sutlej is hemmed in by brown and barren mountains, steep and rocky, without the grandeur of lofty precipices or fringing wood. The hollows through which it receives its tributary streams are dark chasms, without cultivation; the heights crowned with forts, but without any neat villages surrounded with trees to relieve the adjacent desert. The banks of the Jumna, on the other hand, though rocky and wild, are wooded and green, and the sloping faces of the hills fertile and well cultivated; and even at its source, the country, however wild and picturesque, is still not nearly so dreary as the valley of the Bhagiruttee. The features of the landscape are here lofty, rugged, and inaccessible, with less of the beautiful

than of the sublime and terrible. A pleasing contrast to this wild scenery is presented by the smiling valley through which the Pabur meanders, checkered as it is with pasture and crops, and the banks and the hills clothed with cultivation, villages, and wood. Such is the usual aspect of the lower valley of northern Hindoostan, the height of which is for the most part from 3000 to 6000 feet above the plains. The difference between the northern and southern exposures of this mountainous country is remarkable, not only in the formation and structure of the hills and rocks, but in the vegetation. The country on its southern face is of a brown and dusky color; the grass short and parched; the hills rough and lumpy, with rocks standing through the ground; the lower parts bare of wood; and above, the Weymouth pine, with a few stunted larches sprinkled among the rocks; while the higher parts are spread over with oak, holly, and alder, their leaves of brownish green, harmonizing with the burned appearance of the hills, and giving a sombre hue to the whole scene. On the northern exposure a rich color of dark green is diffused over the whole landscape; the rocky sides of the glens are bolder and grander; and they are clothed with noble forests of larch, silver and spruce firs, which shroud from the view the highest and steepest cliffs. "All," says Fraser, "was rich and dark; and here and there a glade opened, or a high slope extended from the base of the rock, or projected between two streams, of a bright beautiful green shining through the sombre forest." This difference between the northern and southern exposures is strongly marked all over the hills.

That strip of flat country, about 20 miles in breadth, which lies at the base of the great Himalaya range, dividing it from the plain of the Ganges, is called Terrae or Terreeana. It is covered with thick forests and low swamps, and, though fertile, it is so unhealthy that it is little cultivated. Bishop Heber graphically describes it as a long, black, level line, extending at the foot of the lowest hills; "so black and level," he adds, "that it might seem to have been drawn with ink and a ruler." This flat does not extend further north-west than through a portion of Rohilcund, where the healthy cultivated country reaches to the foot of the hills, which rise abruptly from the sandy flat beneath. These low hills are watered by streams from the higher mountains, that rise to the level of 1500 or 5000 feet, from which the lower range is frequently separated by fine valleys of some length, which are called *doon* by the natives, answering to the Scottish name of *strath*. The hills which rise beyond this lower range, to the height of about 5000 to 7000 feet, are lofty and majestic, and broken into numerous ridges, divided by deep shaggy dells. This appearance Fraser ascribes to the quality of the rock of which they are composed, which consists of a strongly indurated clay, with a mixture of siliceous matter, forming a rock exceedingly hard, though easily destructible by exposure to the air, and splitting into variously-sized fragments leaving hard marbly masses staring through the scanty soil. It may be finally remarked of this singular and interesting country, that though it appears from the plains to be divided into distinct ranges of terraces, it is really a vast collection of mountains heaped in masses one above another, without any order or plan that can be discovered, until the height of land is reached at the great Himalaya ridge which extends from beyond the sources of the Indus in a continuous chain far into China.

The following are the chief rivers of Hindoostan, with the length of their respective courses to the sea: Indus, 1700 miles; Brahmaputra, 1900; Ganges, 1500; Jumna (to its junction with the Ganges, 780), 1500; Sutlege (to the Indus, 900), 1490; Ghylum (to the Indus, 750), 1250; Gunduck (to the Ganges 450), 980. In the Deccan, and south of India, the Godavery,

850; Kistna, 700; Nerbuddah, 700; Mahanuddy, 550; Taptee, 460; Cavery, 400. There are few coasts of such extent so destitute of islands and harbors as that of Hindoostan. With the exception of emerged sea-banks and mere rocks, Ceylon is the only island near its shores; and on the eastern coast, Masulipatam, which admits vessels of 800 tons burden, is the only harbor for large vessels between Trincomalee, in the island of Ceylon, and the Ganges, which is free from raging surf. To this inconvenience Madras, though an important British settlement, is peculiarly liable. On the western coast, the only harbors capable of admitting large vessels are Bombay and Kurachee, in Scinde; Mangalore admits no vessels drawing more than 10 feet.

Hindoostan comprehends within its bounds the opposite extremes of heat and cold. The plains are burnt up with intense heat; while winter, with every intermediate variety of temperature, prevails in the mountains. Philosophers have in vain endeavored to fix the point of perpetual congelation under different degrees of latitude. They have, indeed, framed a graduated scale of the respective heights at which, according to calculation, this point should begin at corresponding distances from the equator; but theory is here at variance with actual observation. The climate of mountainous tracts depends so much on localities, and the particular course of the winds, as to baffle all general speculation. Hence, on the Himalaya Mountains harvests of grain are found, where, according to hypothesis, the ground should be buried under deep snow; and trees are seen to flourish in the regions of perpetual winter. Captain Webb, in ascending the Himalaya range, saw around him, at the height of 11,630 feet above the level of Calcutta, rich forests of oak, pine, and rhododendra, the ground covered with vegetation as high as the knee, strawberry-beds in full flower, and currant-bushes in blossom; and in 1818, at the Niti Pass, 16,814 feet in height, philosophy was again at fault, as the ground was clear of snow, though above the line of perpetual congelation, and many quadrupeds were feeding on the grassy banks of the Sutlege. It was remarked by Dr. Gerard that vegetation attained a higher level on the northern than on the southern face of the Himalaya ridge, where the extreme height of cultivation is 10,000 feet; the limit of the forest, 11,800 feet, and 12,000 feet that of bushes. On the northern side cultivation rises to the height of 11,400 feet; in other places to 13,600 feet; birch-trees to 14,000 feet; and tama-bushes, which form excellent fuel, to the height of about 17,000 feet. In northern Hindoostan, great and sudden changes of temperature occur, which is the cause of pulmonary affections. During summer, the thermometer, which is often in the morning at 82° or under it, rises to 70°, 75°, and 80°, or upward, during the day; the winters are, however, uniformly severe. In this also, as in other hilly countries, the traveler may be fainting to-day under a tropical sun, and shivering to-morrow amid the rigor of perpetual snows. From the banks of the Sutlege, where the thermometer frequently stands at 100° and 108°, three days' climbing will carry him into the regions of winter.

In the plains of Hindoostan, the heat during the greater part of the year is unintermitting and intense, except where it is modified by the ranges of mountains, or the table-lands toward the west. The seasons here are commonly divided into the hot, cold, and rainy. The spring and the dry season throughout the valley of the Ganges last about four months, the heat gradually increasing with the season, until, in May and June, the thermometer rises to 100° and frequently, in the interior, to 108° and 110°, when it is almost intolerable even to the natives, and still more so to Europeans, who resort to various modes of alleviation, such as the *cuscus tatty*, which is a frame of wood interwoven with twigs, between which is distributed a

layer of a particular kind of sweet-scented grass. This being hung before an open window, in the quarter of the prevailing wind, and constantly moistened on the outside by a water-carrier, diffuses a refreshing coolness.

Vegetable produce.—Hindoostan comprehends all the known varieties of the vegetable tribes. The mountainous tracts of northern Hindoostan produce all the Alpine plants, and the various species of European grain, fruits, and flowers. Deep woods cover those lower ranges of mountains, in which are found the pine-tree of various species, "the tallest, straightest, and most magnificent," says Fraser (Fraser's, *Journal of a Tour through the Himalaya Mountains* p. 189), he ever beheld, the larch, the silver, and the spruce-fir, from the bark and twigs of which resin exudes in abundance; the yew-tree, several species of oak, holly, alder, sycamore, and birch, with mulberry and chestnut-trees. Here is also found the mimosa-tree, from which is made the catechu or India-rubber: the resinous part of this fir, cut into slips, answers the common uses of the lamp. These noble forests extend over immense tracts, and would afford inexhaustible supplies of timber if they could be transported to the proper market. Fruits in great variety are also produced in this elevated region, such as apricots, peaches, and grapes, apples, pears, currants, raspberries, blackberries, and strawberries; roots, such as turnips, carrots, garlic, and onions; flowers and plants, as roses, both red and white, lilies of the valley, jessamines, butter-cups, yellow, blue, and white, cowslips, and sweet-briar, with numerous other beautiful and fragrant plants. The valleys exhibit, according to their altitude and temperature, the productions of Europe or of the tropical countries. At the height of 6000 feet appear the oak and the pine; at that of 3000 feet rattans and bamboos of enormous dimensions; in some parts the pine-apple, the orange, and the sugar-cane, grow to maturity; in others, barley, millet, and similar grains are produced. The lower part of these hills is the seat of the saul forests. The lower valleys yield rice, sown broad-cast, maize, wheat, barley, pulse of various kinds, sugar-cane, cotton, Indian madder, a large species of cardamum, besides other productions. The pastoral tribes of northern Hindoostan feed considerable flocks on the lower hills and valleys; in summer they climb the Alpine country, and browse on the herbage adjacent to the region of perpetual frost.

Rice is the great staple of agriculture throughout Hindoostan, in the plain of the Ganges as well as in southern India. It is sown at the approach of the rains, and it is gathered during the rainy season, about the end of August; the last crop is sown during the same season, and is gathered in the beginning of December. It is esteemed the best, not being equally liable with the other to decay. The diversity of soil and climate, and the several seasons of cultivation, have given rise to infinite varieties in this species of grain. When the rains fail throughout Hindoostan, which occasionally happens, the rice crops are apt to be deficient to a degree altogether unknown in the well-regulated agriculture of Europe, where the severest scarcity hardly ever rises the price of corn more than three times its usual rate. But the famines of Hindoostan leave thousands without subsistence, and fill the land with scenes of misery and death. In the great famine of 1769 it was estimated that 3,000,000 of the people perished; the air was so infected by the noxious effluvia of dead bodies that it was scarcely possible to stir abroad without perceiving it, and without hearing also the frantic cries of the victims of famine, who were seen in every stage of suffering and death; whole families expired, and villages were desolated; and when the new crop came forward in August it had no owners. Bengal has been less liable to famines since this period, but they have frequently occurred in other parts of India. Rice thrives well in the inundated

track of the Ganges, and in southern Hindoostan, especially on the low lands of the sea-coast; higher up the Ganges, wheat and barley are more generally cultivated, also in the high grounds and elevated table-lands of southern India. Other kinds of grain are cultivated, such as Indian corn; and great varieties of pulse and coarse grains, such as peas, beans, chiches, gram, vetches, and raggy, which is the most important crop raised in the dry field, and in some parts of southern India is the subsistence of all classes, in others of the poorer classes. These are important articles of cultivation, as they have each their particular season, and thrive even on poorer soils. Maize is the general produce of poor soils in hilly countries, and is commonly cultivated in the more western provinces. Millet and other grains are also cultivated, and vegetating rapidly, in every season they fill up profitably for the farmer the short intervals between the other modes of cultivation in lower Hindoostan. Sugar is everywhere cultivated, and at little expense by the Hindoo cultivator; and as the sugar of India is no longer subjected in the United Kingdom to an unequal import duty, there is reason to hope that the produce of India may compete not only with the sugars of British colonies, but those also of Cuba, Brazil, Siam, and Manilla. Though formerly unknown in Europe, sugar has been produced in India from the remotest times, and was thence transplanted into Arabia, whence it has been introduced into Europe, Africa, the West Indies, and America. It grows luxuriantly throughout all the valleys of the Ganges, and in the plains of southern India, and could be produced, with the help of European skill and capital, to meet any demand. It thrives more especially in Bahar and Benares, and in particular districts of Bengal. Opium is the peculiar and staple produce of the province of Bahar, and is also extensively cultivated in Malwah, and in other parts of Hindoostan. It is a precarious crop, producing alternately high profits and heavy losses. The liquor extracted from the poppy is collected as it exudes, and is then placed in pots, where it is dried and formed into lumps, in which process it loses from one tenth to one eighth of its weight. The opium produced in Bahar and Bengal being monopolized by the East India Company, and bought at a fixed price, is a contraband article of trade, and its cultivation is confined to certain districts. Within Bengal no one is allowed to cultivate the poppy, except for the government. In Malwah a treaty was entered into with the different rulers and chiefs, by which the monopoly was extended to that country, and all that was produced delivered to the Company, at the rate of three rupees a seer, which is two pounds. But so great was the discontent excited by this extension of the monopoly, that, at the desire of the chief, the treaties were rescinded in 1819, 1820; and the trade in opium and its cultivation is now free in that province, and everywhere throughout India, except in the Company's dominions; but as Malwah is completely surrounded by British territory, a large revenue is derived from the high duty levied on Malwah opium, in transit to Bombay for exportation to China. Malwah opium equals that of Bengal, and is brought into competition with the Company's opium in all the foreign markets, and especially in China (see appendix to the report on the East India Company's affairs, p. 15). The cotton plant has from time immemorial been one of the staple products of Hindoostan, and is indigenous from Ceylon in the south to the Himalaya Mountains. It is cultivated extensively throughout Bengal, and in the interior provinces, on the banks of the Jumna; also in the Deccan, and in southern India, whence it is imported into Bengal, and into Mirzapoor, and the district of Benares, where it is manufactured. Flax and hemp are also cultivated in several districts both in the north and in the south of India. Silk was long the exclusive product of India and China. Silk-worms are now reared

principally in the district of Burdwan, and in the vicinity of the Bhagirati and the Ganges, and for about 100 miles down their streams. Four crops of mulberry-leaves are obtained in the year, the last in December. A considerable quantity of silk, of a coarse kind, is obtained from wild silk-worms, which do not feed on the mulberry, and are found in the forests of Silhet, Assam, and the Deccan. Indigo was originally a product of India; and the plant was afterward carried to South America, whence Europe was for a long time supplied with this dye. The manufacture, on which the quality of the indigo depends, was very unskillfully conducted until the year 1783. Since this period it has been so much improved by the skill and capital of Europeans that it is now a staple article of commerce; and in Bengal the value of the produce in 1854 amounted to £1,701,206. Indigo is produced generally throughout the plain of the Ganges, and in southern India, but chiefly in Bengal. Tobacco, formerly unknown in India, and introduced from America probably about the beginning of the 17th century, is now extensively cultivated in every part, chiefly however in the northern provinces, and more rarely in the south. The tobacco grown in the Mahratta territories is most esteemed, particularly that which is produced near Bilsa, a town in Malwah. Bengal does not yield good tobacco; but the Company's territories in Guzerat, being principally of a rich black soil, are considered as peculiarly suitable to its cultivation (see letter of the Secretary to the Court of Directors, to the Secretary of the India Board, 5th September, 1828). The Hindoos having been already in the habit of inhaling the smoke of hemp-leaves and other intoxicating drugs, readily adopted tobacco as a more agreeable substitute, and it soon came into general use. Their recent knowledge of it appears from their having no name for it which is not a corruption of some European term. Pepper, though of inferior consequence, is a valuable product of southern India, especially of Malabar. It is produced from a species of vine, which is made to twine around the jack-tree. It bears fruit about the third or fourth year, amounting to from three to seven pounds' weight, and yields two crops in the year. The areca-nut and betel-leaf, universally chewed by the natives, thrive in the low grounds, where water is abundant; and cardamoms, a spice in great repute. The universal and vast consumption of vegetable oils in Hindoostan, for food, or unguents, or for the lamp, is supplied by the extensive cultivation of mustard-seed, linseed, sesamum, palma, christi, besides what is procured from the cocoa-nut. The first ripen in the cold season, the sesamum during the rains, or soon afterward.

The forests in the low plains of Hindoostan, of southern India, and those which cover the western range of the Ghauts, and more sparingly the eastern Ghauts, abound in the most valuable trees, applicable to many important uses. The extensive woods in southern India supply the teak-tree, valuable for ship-building; and in Malabar, extensive tracts of waste land have within the last few years been converted into teak plantations by the government. Saul, sissou, toon, and bamboo-trees abound; the last of which yield a medicine much used by the native doctors, and which sells for its weight in silver. There are many species of the palm-tree, with its luxuriant and spreading leaves, of which the produce is extremely useful. The cocoa-nut-tree is, in some provinces, an important article of culture. The kernel is used for food by the richer natives, either in the raw state, or dressed after various fashions; and it yields by far the finest oil in India, if the nut be fresh, and the oil quickly used. Extensive tracts, many miles in length, are planted with the cocoa-nut and betel-nut palms. Many other species of timber are found in the deep recesses of the woods, of which Dr. Buchanan, in his account of Mysore, gives a particular description, with the botan-

ical names of the different trees, and to his work we refer; observing, generally, that the woods consist of every description of timber, black, heavy, and strong, and adapted for the beams and posts of houses; other kinds are white, hard, and durable, and adapted to all the purposes for which strong materials are required; some are beautifully grained, and take a fine polish, and are well suited for furniture, or exude resins and gums of a sweet scent, that are used in temples for incense; the wood of some kindles readily into a clear light, and is used for torches (see *Journey from Madras, through Mysore, Canara, and Malabar*, vol. i., p. 25). Other kinds of wood are employed for dyeing. The sandal-wood is valuable for its perfume, and for the essential oil which it yields. It requires a strong soil, and it is 12 years before it attains the proper size for being cut. The billets of wood are prepared by being buried in the dry ground for two months, when the ants eat up all the outer wood, leaving the heart, which is the sandal. The deeper the color, the higher the perfume. The best sandal-wood of Hindoostan is now in possession of the rajah of Mysore, who succeeded to a small portion of Tippoo's dominions.

Animals.—Hindoostan, from the great extent and inequality of its surface; its stupendous and snow-clad mountains, and its vast and wooded plains, lying under a burning sun, comprehends all the most interesting forms of animal life, more especially those animals of the tropical regions remarkable for ferocity or size, which have been the subjects of scientific research as well as of popular curiosity in all ages, and which find ample cover in the deep woods and jungle-covered wastes of those tracts of the country which have been desolated by tyranny or war.

However much the following statistics of the financial concerns of the British Eastern empire may be at variance with the exaggerated ideas entertained respecting it, as well by a large proportion of the people of England as by foreigners, it will excite no surprise in the mind of any one who has ever reflected on the subject. It is due, indeed, to the directors, to state, that though they have occasionally acted on erroneous principles, they have always exerted themselves to enforce economy in every branch of their expenditure, and to impose and collect their revenues in the best and cheapest manner. But though they have succeeded in repressing many abuses, it would be idle to suppose that they should ever entirely succeed in rooting them out. How can it be imagined, that strangers sent to India, conscious that they are armed with all the strength of government, placed under no real responsibility, exempted from the salutary influence of public opinion, fearing no effectual exposure through the medium of the press, and anxious only to accumulate a fortune, should not occasionally abuse their authority? or that they should manage the complicated and difficult affairs of a vast empire, inhabited by a race of people of whose language, manners, and habits they are almost wholly ignorant, with that prudence, economy, and vigilance, without which it were idle to expect that any great surplus revenue should ever be realized?

India Company, the East.—The first commercial intercourse of the English with the East Indies, was a private adventure with three ships fitted out in 1591; only one of them reached India, and after a voyage of three years, the commander, Captain Lancaster, was brought home in another ship, the sailors having seized on his own; but his information gave rise to a capital mercantile voyage, and the Company's first charter, in December, 1600. Their stock then consisted of £72,000, and they fitted out four ships, and meeting with success, have continued to trade ever since. India stock sold at £500 for a share of £100, in 1683. A new Company was formed in 1698; and both were united in 1702. The India House was built in 1726,

and enlarged in 1799. Board of Control instituted 1784. See EAST INDIA COMPANY.

Railroads in India.—There are several railroads going forward in different parts of India, which promise to be productive of a great increase in the trade of that country, though it is more questionable whether for some years to come they will afford a very ample income to the proprietors, for the heavy cost of the construction. One of the lines first undertaken is the East Indian, extending from a navigable part of the Ganges toward Delhi. This road is already partially opened, and the report of its operations for the first six months of the year 1856, contained a return of 432,321 passengers transported, and 38,010 tons of freight. The work from Allahabad to Cawnpore was going forward successfully at the date of this report, but it had been since retarded beyond the expectations that had been entertained, by the difficulty in carrying forward the materials. The earth-work was nearly completed at that time. Allahabad is near the junction of the Jumna with the Ganges, 600 or 700 miles above Calcutta. The work was to be extended from Cawnpore to Delhi under the officers of the Company, without contractors. We have lately seen an account of the total loss of a costly locomotive, destined for this road, by being sunk in the Ganges. A portion of the Great Indian Peninsular road, beginning at Bombay, has also been opened, and a location for the extension of the line has been recently made, from Nagpore to Jubbulpore, where it will unite with the East Indian, thereby forming an entire line of inland communication following, in part, the course of the Ganges, from Bombay to Calcutta.

The Scinde Railway, another important work designed for opening the trade of the great valley of the Indus, has already made considerable progress. It will extend from Hyderabad to the port of Kurrachee, a distance of 110 miles, it being rendered necessary on account of the difficult navigation of the mouths of that river. As an appendage to this work, a more extensive one called the Punjab Railway has been lately projected, and a prospectus of it is now advertised in the London papers. It is to be 230 miles in length, beginning at Mooltan on the Indus 470 miles above Hyderabad, and running thence to Lahore and Umritsir, through a country of remarkable equality of surface. It is to form, in connection with the Scinde Railroad, and an improved system of steam navigation on the intermediate portion of the River Scinde or Indus, between Hyderabad and Mooltan, a connected line of communication from Kurrachee, which is destined to be the principal port for western India, to Lahore the capital of the Punjab. From Lahore it will be further extended 36 miles to Umritsir, the commercial capital of a very large and productive trading district, making in all, by railroad and steam navigation, 810 miles. For the Punjab railroad alone it is proposed to raise a capital of £2,500,000, of which two fifths of the shares are reserved to the shareholders in the Scinde Company, in the proportion of two shares of the former to one held of the latter. The prospectus advertised in the London papers contains the following description of the region of country through which this line of communication will pass, extending nearly the whole length of the valley of the Indus:

"A railway from Mooltan to Lahore and Umritsir will not only afford an outlet to the impeded traffic of Punjab and neighboring territories, but would of necessity greatly enhance the importance and value of the line from Kurrachee to Hyderabad. Scinde and the Punjab (including the States under control) cover an area of 130,000 square miles, with a population of nearly 25,000,000. The flower of the European and native army occupies these provinces, and numbers 70,000 men, more than 15,000 of whom are Europeans."

The following further description of this region of country, is from the *Calcutta Englishman*:

"Lahore, situated on the Ravee, is the capital of the Punjab and the seat of its political administration. The town is very extensive, and carries on a brisk internal trade. The civil station of Anarkullee, and the large military station of Meean Meer, are likewise attached to it. Umritsir, the commercial capital of the Punjab, distant 36 miles, is at least equal, if not superior, to Delhi in population and wealth. The intervening country is level, and without even a nullah of any size, and an intercourse of so great an extent is maintained between them, that the road is literally thronged day and night with every description of wheeled vehicles, horses, camels, etc., and foot passengers; in short, more resembling the street of a town than a mere communication between two cities so far apart. Umritsir is the grand entrepôt for the commerce of the cis-Sutlej States—the rich and mountainous regions eastward to Kote Kangra—the horses, fruits, and woollens of Cabul and Bokhara, the shawls and other produce of Cashmere, Yarkhand, and the mountainous country toward the north-east—in fact, of the whole Punjab and the countries encircling it, are here concentrated. Mooltan is a large town and military station on the Sutlej or Gharra, so termed after its conjunction with the Beas. It is quickly becoming an important emporium, for it is the connecting link to the trade of northern with south-western India, or rather Bombay and Europe. Kurrachee, situated at the mouth of the Indus, is fast advancing into prosperity and into notice as a sea-port; it will probably soon be known as the first in the empire, being superior to Calcutta, Madras, or even Bombay."

The distance between Calcutta and Bombay in a direct line is a little more than a thousand miles. By the indirect route which must be pursued by the Peninsular line, to find one adapted either to steam navigation or to the construction of a railroad—that is, by following the course of the Ganges, so far as the route is eligible, and from the point thus reached, by selecting the line best adapted to the construction of a railroad, taking into consideration the comparative evenness of surface, and the production, resources and population of the country to be traversed, the distance will not be less than 1600 miles, exclusive of the minor sinuosities of the route, which can not be accurately estimated until the line is definitively laid down. It is already ascertained that easterly from Nagpore, coal of an excellent quality for the making of coke at a low cost is found in abundance. Extensive as these railway routes are, it will be perceived that they bear no comparison, in point of extravagance, and hopelessness of execution, with the vast routes projected between the Mississippi and the Pacific in various directions, traversing regions uninhabited and uninhabitable, and passing over mountain ranges, which almost bid defiance to the power of the locomotive. In one case, the projected routes pass through countries already covered by an immense population, and affording valuable products adapted to become the objects of a profitable trade, and consequently capable of contributing to the support of the line throughout every part of it. In the other case, nearly the whole country to be traversed, by the most favored of the projected routes, is destitute not only of the means of affording even a partial support to the route when constructed and put in operation, but in a great measure incapable of furnishing even the timber necessary for its construction and repairs, the fuel necessary for locomotives, or provisions for the men who must be employed in running them.

The great lever, however, by which England will, in a greater ratio than ever, increase her power in the East, will be the *railroad system*. And in this policy rapid strides and important results have been already accomplished. As early as August, 1855, it was stated

in the House of Commons that the East India Company had sanctioned the construction of one road 590 miles in length, to be completed in the year 1856, with a guaranty of 5 per cent. dividend by the Company. In other words, private capitalists having subscribed the required capital, the Company therefore gave a guaranty of 5 per cent. income, upon a capital of \$20,000,000. Other roads have been projected, and are now in course of construction, with an aggregate line of over 3000 miles. From one extremity of British India to the other, the magnetic telegraph is in full operation. The intelligence carried from England to Bombay, was, as far back as April, 1855, transmitted to Calcutta by telegraph. The three grand trunk railroads are:

	Length, miles.
1. From Calcutta to Peshawur.....	1,423
2. " Calcutta to Bombay.....	1,002
3. " Bombay to Agra.....	734
Total.....	3,159

4000 miles of telegraph wire are now set up in India, and in constant use. In the construction of this immense line of wire, 70 large rivers were crossed. In one case the cable over a river measures 15,840 feet, and in another over two miles in length.

In order to carry out the views of the British government and of the East India Company especially, a standing army of 289,000 men (European and native), is maintained. It requires little foresight to show that it is in India (at present) and in China (hereafter) that the British power will for many years be developed to an extraordinary degree. With the aid of capital, now abundant in India, and with the further aid of railroads, manufacturing machinery, steamships and steamboats, the magnetic telegraph, and cheap labor, the commercial and political power of Great Britain will soon overshadow all others. The subject furnishes points of inquiry and consideration, which should be duly weighed by the statesman, the merchant, and the philanthropist.

We have all looked with astonishment upon the vast commercial changes that have transpired in the world within the past 20 or 30 years. Science, genius, enterprise, and capital are yet at work transforming, modifying, creating. America has witnessed great transformations within that period. It would seem that Asia is likely to undergo equally important changes, through the means of the British government and its thousand agents. There is no reason why the United States, availing themselves of the newly-enlarged field of operations in the East, should not find a profitable market for their manufactures, and further employment for their shipping.

Metals.—From the wild and inaccessible nature of the country in many parts of Hindoostan, its metallic products are but imperfectly known. It is found to produce all the metallic ores, as well as diamonds and precious stones, and other mineral substances. Gold is generally found in the sands of the mountain streams, and is extracted by washing. The head streams of the Ganges bring along with them particles of gold, which in Rohilcund are collected by a particular caste of people. It is found in various parts of Mysore, particularly nine miles east of Boodicootta, where the country is impregnated with it; also in the Nialgherry Mountains; and in great quantities in all that tract of country that lies west; and in the adjoining Koondanad and Ghaut Mountains. This whole tract, including the mountains, and comprising a space of 2000 miles, contains gold. Unrefined gold is regularly exchanged by many of the mountain tribes of the north for the produce of the plains. It is estimated that about 1000 men are continually employed in collecting this precious metal. Copper is produced in the province of Delhi, which the natives collect either on the surface or with very slight excavations; also in the Rajpoot principality of Jeypoor in the province of Ajmeer,

and in other parts of the same province, there are copper mines, and in the Carnatic, about 40 miles north-east from Cuddapah. The metal is found in layers about two inches, and occasionally two feet thick; they are coated with ochre, and are in general flat, as if they had undergone compression. The ore exists in nearly a metallic state, without any admixture of sulphur, arsenic, or any other substance that requires separation. The best ores yield 50, and the worst 6 per cent. of pure metal. The granitic mountains of Nepal and northern Hindoostan contain much iron, lead, and copper, with a little gold in the river courses. The copper mines are quite superficial, the ore being dug from trenches entirely open above, so that the work is laid aside in the rainy season. Iron ore is found in many parts of Hindoostan. There are mines of iron in Lahore and in Ajmeer. In Orissa many of the natives are iron smelters, and most of the iron sent from Balasore to Calcutta is produced in this district. In Bejapoor the working of iron furnishes employment to many of the inhabitants, who extract it by a very rude process. At Porto Novo, in the British district of South Arcot, in the presidency of Madras, extensive iron-works have been erected by a joint-stock association called the East India Iron Company; to whom also belong the iron foundry works at Beypoor, in Malabar, on the opposite coast of the peninsula. The ore smelted at these establishments is found in great abundance and of excellent quality in their respective vicinities. The Mysore country abounds in iron. There are also forges for manufacturing steel, which are minutely described by Dr. Buchanan in his account of the Mysore country.* In Coimbatore and in Malabar the iron mines give employment to a considerable number of persons. The process and machinery for extracting the iron are very imperfect. Iron mines were formerly worked in the district of Bogliipoor, but they have been long neglected. Rich iron ores are abundant in Cutch. The ore is gathered in baskets from the surface of the earth, and yields 22 per cent. of iron; and the steel which is made from this ore is the finest in the world. Lead is produced in various parts; also antimony, plumbago, sulphur, alum; and there are inexhaustible supplies of coal, though the mines are not worked with any effect. Coal is raised in Burdwan in considerable quantities and of a fine quality. Saltpetre is produced in Bengal and Bahar, though its manufacture does not go beyond the eastern limits of the latter province. It might, however, be attended with success in Bengal, where the tendency of the soil to its production is very great; and there might be manufactories of salt in almost every part of the country, but they are restricted by the Company's monopoly. In the Mysore plains the wells are salt, and the ground is frequently covered with a saline efflorescence. A range of hills, extending from the Indus to the Hydaspes, yields the famous rock-salt of Lahore, of which they are almost entirely composed.† Many quarries are found in the hilly districts, which produce fine stone, that is cut by the inhabitants into pillars, flags, statues, and used for other ornamental purposes. Dr. Buchanan saw several fine-grained specimens of granite, also a black stone used in the construction of Hyder's monument, and a beautiful green stone which takes on a marble polish. The hills of Guzerat contain marbles exhibiting many colors and qualities; and marbles are seen in the various tombs and monuments of ancient art still remaining in the country, finely ground and of different colors, white and yellow with red veins, and green clouded with yellow and black, of which the quarries have never been discovered.

Diamonds are no longer found in the celebrated mines of Golconda, but they are still gathered in the bed of the Krishna, and in the province of Gundwana. Near the confluence of the Hebe and the Mahanuddy, 13 miles beyond the town of Sumbulpoor, after the rains, the natives find diamonds in the red earth washed down from the mountains. The matrix containing them is a clay which has a red appearance like burned bricks. There are diamond mines in the south of India, about 7 miles north-east of Cudhapah, on both banks of the Pennar River. These mines have been worked for several hundred years, and occasionally yield large diamonds, which are either found in the alluvial soil, or are recognized by their sparkling among the gravel after it is washed and spread out, or in rocks of the latest formation. The grounds are leased on behalf of the government to private speculators at a moderate rent. In Bundelcund, also, the table-land which surrounds Pannah, wherever the ground is of a gravelly nature, produces diamonds. The soil is from two to eight cubits deep, and diamonds are found intermixed with small pebbles, though not adhering to them. A very few diamonds in the course of a year repay the labors of the workmen. The diamonds found are mostly under the value of 500 rupees, or £50, though some reach the value of from 500 to 1000 rupees. They are weighed and sold to the merchants residing at Pannah, and are by them carried to all parts of the country. The workmen are allowed three fourths, two thirds, or a half the diamonds they find, according to their size, and any man is at liberty to dig; but the business is less prosperous than formerly, and the workmen are poor. The diamond grounds are strictly guarded against the contraband trader, and the least delinquency draws down the prompt and barbarous vengeance of the rajah. These are supposed to be the diamond mines mentioned by Ptolemy. Their annual produce was estimated, in the reign of Achar, at eight lacs of rupees. In 1750 it had fallen off to one half; the amount, comparatively insignificant, is divided between the rajahs of Pannah, Banda, and Chirkaree.

The other varieties of precious stones found in India are the ruby from the table-land of Mysore, the beryl, the topaz, the chrysolite, garnet, cat's eye, etc. There are cornelian mines in the province of Guzerat, in the wildest parts of the jungle. They consist of numerous shafts worked down perpendicularly, about four feet wide, and several of them to the depth of fifty feet. Some of them extend at the bottom in a horizontal direction, though not to any distance; the heavy rains cause the banks to fall in, so that new openings are always made at the end of the rainy season. The nodules weigh from a few ounces to two or even three pounds, and lie close to each other in abundance, not in distinct strata, but scattered about. They are of various colors when they are found—of a blackish olive, like common dark flints; others of a lighter hue, with a slight milky tinge; though it is quite uncertain what appearance they will assume after the process of turning. They are carried to Cambay, where they are cut, polished, and formed into the fine ornaments for which that city is so highly celebrated. Beautiful jaspers and agates are also found in this district, and in other parts of India.

Manufactures.—In every country the nature and quality of the manufactures must depend on the condition of the consumers, and among the despotic States of Asia these naturally consist of two classes: 1st, of the great and powerful, in whose hands the property of the country is accumulated, and who are comparatively few; and, 2dly, of the mass of the people, oppressed under native rule, and sunk in poverty. Such, accordingly, has been from time immemorial the state of Hindoostan; and its manufactures, which are necessarily adapted to the use of these two classes, have always consisted of exquisitely fine fabrics of cotton,

* *Journey from Madras*, vol. 1., pp. 170, 180; vol. II., p. 139.

† See the observations of Lieutenant Burnes on the commercial relations of the Punjab.

for the use of the imperial court or of the rajahs and princes of the country, or of coarse stuffs for the common people; and to such perfection have they attained, that the modern art of Europe, with all the aid of its wonderful machinery, has never yet rivaled in beauty the product of the Indian loom. Yet the Hindoo workman has no advantage from capital, from machinery, or from the division of labor; he prepares the raw material with his own skillful hand, in all the various stages of its manufacture; his loom and all his implements are of the rudest construction; and yet, by patience, perseverance, and unusual skill, he produces an article which is prized all over the world for its inimitable richness and beauty, as well as for its durability. The native artisan distinguishes at once these fine fabrics from all counterfeits, by the eye, the touch, and the smell. In the district of Dacca are chiefly fabricated plain muslins, variously denominated, according to the closeness or fineness of the texture; also flowered, striped, or checkered muslins, denominated from their patterns; and the thinnest sort of muslins, for the manufacture of which the province is much celebrated, as is Coromandel in southern India for its calicoes and other piece-goods, of the most brilliant and durable colors. Other kinds more closely woven are fabricated in the western parts of Bengal; and another sort, of a more rigid texture, in every district. Coarse muslins, in the shape of turbans, handkerchiefs, etc., are made in all parts of Hindoostan; and in its northern provinces, plain and flowered muslins, but of inferior quality to the beautiful fabrics of Dacca. In Moultan are manufactured silks which possess a strength of texture and brilliancy of hue that have secured for them a preference in the Indian market. They are woven into shawls and scarfs, which are in great demand, and which the Indian manufacturer in other parts has never been able to rival, either in color or durability. Carpets are also manufactured in this province, though they do not equal those of Persia. Various articles of calico are made, which still retain their Indian denominations, as khasahs, which are manufactured north and east of the Ganges; cloths of nearly the same quality are made near Tanda in Oude. Near Luckipoor, on the western frontier of Benares, in the neighborhood of Allahabad, and also in the province of Bahar baftaes are manufactured; sanaes in Orissa, and in the district of Midnapoor; and a similar cloth under the same denomination in the eastern parts of the province of Benares; woven silk and taffeta, both plain and flowered, in the neighborhood of Moorsheadabad; tissues, brocades, and ornamented gauzes, at Benares; plain gauzes for domestic use in the west and south of Bengal; and at Moulda, Boligpoor, and at several towns in the district of Burdwan, mixed goods of silk and cotton. Sackcloth is manufactured from packthread in many places, especially in the northern provinces, for the clothing of the mountaineers. Cotton is made into canvas in the neighborhood of Chittagong, Patna, and other places; and blankets everywhere for common use. A coarse cotton cloth dyed red with cheap materials is very generally used, and is chiefly manufactured in the country between the Jumna and the Ganges. Fine and coarse calicoes are dyed with permanent and fugitive colors for common use in the province of Benares, the city of Patna, and the neighborhood of Calcutta. This art appears to have had its origin in India, and to have been there perfected to a degree never surpassed by Europeans. Dainties of various kinds, and damask linen, are made at Dacca, Patna, Tanda, and various other places.

In Mysore, near Bangalore, silk is manufactured into different articles of dress, into strong cloths, which men, women, or boys wrap round them, and into turban pieces. These cloths are of a rich fabric, variously figured, and the pattern, if ordered, is elegantly wrought in gold thread. Turbans are made of cotton

and silk. Thin white muslins with silk borders ornamented with gold and silver, and plain green muslins, with silk borders, are manufactured for female dresses; also striped and checkered muslins; cloth like the khasahs of Bengal, for wrapping round the shoulders of men, sometimes with striped or silver borders. Handkerchiefs with red borders, a coarse thick white cotton cloth with red borders, and turbans ornamented with silver and gold thread at the ends, are also made in this district; and the dyeing of cotton cloth, cotton thread, and silk, is carried on by a set of people who act as tailors, cloth-printers, and dyers. Tanneries are established, and manufactories of oil. At Chennapattana there are manufactories of glass-ware and of glass rings, universally worn as bracelets by the women of the Deccan. Steel wire is also made here for the strings of musical instruments. At Vizigapatam, in the northern Circars, the inhabitants are very expert in carving curious little boxes of ivory and bone. Throughout southern India manufactories of cotton silk are generally established. In the northern Circars the principal part of the East India Company's investment of piece-goods was formerly provided. This country, extending about 500 miles along the coast of Coromandel, from the River Kistnah to the borders of Cuttack, has from very early times been the seat of an important and extensive manufacture of cotton piece-goods, of which the description of calicoes known as Madras long cloths and salempores are the chief, and, with Masulipatam dyed handkerchiefs, and other kinds of goods for the African and West India trade, have, until lately, been in great demand. Masulipatam goods have, however, for some years been entirely superseded by the manufactures of Manchester and Glasgow; and in all appearance the northern Circars will at no distant period of time be deprived of the manufactures of white calicoes also. A great change has indeed been brought about in the manufactures of India by the introduction of British goods, which, in many branches, have supplanted those of the country; the poor Hindoo, notwithstanding the low rate at which he works, is thus undersold in his own market by the manufacturers of Manchester and Glasgow; and this competition of British goods nearly ruined the native manufacturers of India, deprived the workmen of employment, and reduced them to great distress; so that the directors remark concerning the Indian trade, that "it exhibits the picture of a commercial revolution, productive of much present suffering to numerous classes in India, and hardly to be paralleled in the history of commerce."

Commerce.—Hindoostan, from its great extent, and the diversity of its soil and climate, supplies the materials of an extensive commerce. Its internal trade is great, while its rare and precious products are exported to the remotest regions of the world. An extensive commerce takes place between Bengal and the other maritime districts, and the western provinces of Hindoostan, consisting in the exportation of grain from the corn districts, in exchange for salt, a great staple; for betel-nut, sugar, raw silk, silk and piece goods. From the native States of central India Malwah opium is sent down to Bombay for exportation to China. In Bengal the culture and manufacture of opium are conducted under a State monopoly, and the produce is transmitted to Calcutta, where it is disposed of by public sale. The holy city of Benares is a great mart of trade, in which are exchanged the shawls of the north for the diamonds of the south, and for the muslins of Dacca and the eastern provinces: and it has besides, very considerable silk, cotton, and fine woolen manufactures of its own, the produce of which is exchanged for other commodities. Through the northern provinces of Delhi and Lahore a great trade is carried on between the hill countries and the plains. The inconsiderable town of Hurdwar or Hardiwara, being a celebrated place of Hindoo pilgrimage, is a

great commercial emporium, to which multitudes resort for the purposes of trade, as well as from piety. This great annual concourse takes place in the spring, when the produce of the northern and western countries is exchanged for the manufactures of the lower provinces. The principal articles brought here for sale from Cabul, Candahar, Moultan, and the Punjaub, are horses, mules, camels; some of these from Balk, Bokhara, and the countries on the northern side of the Hindoo Coosh Mountains; a particular species of tobacco, antimony, assafetida, dried fruits, such as apricots, figs, prunes, raisins, almonds, pistachio nuts, and pomegranates; from Cashmere and Amritsir, shawls, dootas, and pautoos; spotted turbans, looking-glasses, toys, with various manufactures in brass and ivory from Jeypoor; shields from Rohilcund, Lucknow, and Silhet; bows and arrows from Moultan and the Doab; rock-salt from Lahore; baftas and piece-goods from Rahn, a large city in the Punjaub. The country of Marwar also supplies many camels, and a species of flannel called loo. In exchange are brought from the British provinces Kharwa muslins, mushroo or sarsnet, and woolen cloths, the coarsest of which only find a market. In this fair, Dutch and Venetian coins are current; and some toys of European manufacture were seen exposed to sale by Mr. Webb. The northern merchants by whom it is frequented assemble at Amritsir in caravans about the end of February, and pursue their route in an easterly direction through the territories of the protected Seikh powers. Still further to the north and west the provinces of Lahore and Moultan export to the countries to the west of the Indus, sugar, rice, indigo, wheat, and white cotton cloths, hides, etc. The imports are swords, horses, fruit, lead, and spices; and into all these countries European goods are imported from the lower provinces. The southern provinces export to Bengal, pepper, betel-nut, sandal-wood, and cardamums, teak timber, etc.; while they receive in return salt and rice, cotton cloths, and articles of European manufacture.

A very considerable coasting trade is carried on between the different parts of Hindoostan. Bengal exports to Madras and the coast of Coromandel, grains of different descriptions, sugar, saltpetre, molasses, ginger, long pepper, oil, silk wrought and unwrought, muslins, spirits, and provisions. The returns are salt, red wood, fine long cloth, izarees, and chintzes. From the Malabar coast the imports are sandal-wood, coir rope, pepper, cardamums; and the returns are generally in the annual supplies which Bombay receives from Bengal. From Bombay are brought teak timber, elephant's teeth, lac, etc.

From the reputed wealth and precious produce of India foreign nations were always desirous to participate in its trade. Prior to Alexander's expedition to the East it was scarcely known to the Greeks, nor is it certain that they had ever seen its productions. But we know that these were brought to Rome, especially silk, which so allured the vanity of the Roman ladies that it sold for its weight in gold. Other valuable commodities of India, such as calicoes, muslins, aromatics, ivory, diamonds, pearls, and other gems, precious aromatics, the pepper of Malabar, turtle shell, etc., and some dry sugar and indigo, were also imported into Alexandria, the chief emporium of eastern commerce, and were naturally attracted to the great metropolis of the ancient world. This trade was carried on from Myos Hormos, the chief port on the Red Sea, whence, after the conquest of Egypt by the Romans, the annual fleets, sometimes of 120 vessels, set sail, and, under the propitious influence of the south-west monsoon, boldly stretched across the Indian Ocean for the western coast of Hindoostan, which they reached in about 40 days; and afterward extended their voyage round Cape Comorin to the coast of Coromandel and the mouths of the Ganges. The high

price received for these eastern luxuries in Rome encouraged the merchants to provide larger vessels, and a band of archers to defend them against the pirates, who then, and until very lately that they were extirpated by British ships of war, infested the western shores of India. The commodities of the East being landed at Myos Hormos, were carried on camels to Coptos, the seat of a flourishing trade, and thence by sea to the Nile, whence they reached Alexandria by water carriage, and were re-shipped to the different ports on the Mediterranean. The produce of India was also brought to Europe by other routes—namely, by the way of Palmyra, then a flourishing city, and thence to Rome and other western countries, through the ports of Syria: or across the Himalaya Mountains to the Oxus, thence to the Caspian, and afterward to the Black Sea, and finally to its ulterior markets in Europe. But though there was a demand in Europe for the produce of India, there was no demand in India for the produce of Europe; and bullion was the only article that could be sent out in exchange. The annual drain of gold from Rome and its provinces for Indian goods was estimated by Pliny at 500 sesteritia, equal to about £400,000. In the convulsions which followed the decline of the Roman empire, the trade of the East was successively engrossed by the Persians and Arabians. The latter, in the year 636, built the city of Bassora, which soon grew into a great commercial mart; and to this place, and to Ormus, long celebrated for its vast riches and its trade, the spiceries and merchandise of India were brought, and distributed through the various ports of the Mediterranean. After the expulsion of the crusaders from Syria and Egypt, Alexandria again became the chief entrepôt of eastern produce, whence it was carried to Italy by the Venetians and others, and distributed throughout Europe. But the discovery of a passage to India in 1495 by the Cape of Good Hope changed the course of this trade, which now entirely left the Italians, and was engrossed by the Portuguese for nearly a century without any molestation from European rivals. At length the Dutch and the English became their competitors, and established joint-stock companies, with the exclusive privilege of the eastern trade. But their anticipations of profit were not realized. The great distance of Europe from India, and the want of an equivalent for its produce, precluded any extensive intercourse; the trade accordingly bore a very small proportion to the trade of the country; and being besides cramped by monopolies, it never attained its natural growth. In 1773 the average exports of Britain to India amounted to about £489,000 a year; in 1793, on a like average, to about a million a year; and it does not appear that a greater trade was carried on with India from any other part of Europe. The commerce of nations is limited to the surplus produce which they can mutually exchange; and, from the great distance between India and Europe, this surplus produce was long confined to those few articles which, containing a great value in small bulk, could bear the expense of a long voyage. The demand was also altogether on the side of Europe, and its trade with India consisted merely in the purchase, with bullion, of a small quantity of precious articles for the consumption of the rich. The progressive improvement of industry in Europe, together with the entire opening of the trade to India and China since the year 1834, has occasioned not only a greater exportation of British goods, but a change also in the nature of the trade. It is not so much the produce of the labor as of the climate and soil of India, which no ingenuity can supply, that is in demand in Britain; and, accordingly, while the import of Indian manufactures has fallen off, that of the raw material, and many varieties of vegetable produce, has increased. Thus the importation of cotton piece-goods—namely, white calicoes and muslins—which amounted in 1814 to 1,266,608 pieces had de-

creased in 1853 to 428,294 pieces; while within the same period the importation of cotton wool had increased from 2,850,318 lbs. to 181,369,994 lbs., and the exportation of cotton manufactures in a similar ratio. Even the incomparable muslins of Dacca are in less demand since the introduction of British goods. Thus, in the progress of the trade between India and Europe, the former country, notwithstanding its boasted wealth and superior industry, has taken the lowest place, exporting her rude produce for the manufactures of the richer country. This is the nature of the trade carried on between Britain and America and the countries in the north of Europe, and is a sure index to the respective progress of the two countries in wealth and improvement. Those countries which can not manufacture their own rude produce send it to Britain, which abounds in capital, and still more in art and industry; and both countries are benefited, the poorer country exchanging its surplus produce for a supply of manufactures of which it is in want, and the richer country the produce of its overflowing capital for a supply of the raw material which its own soil does not afford. This is now the relative condition of Great Britain and India. The former having outstripped the latter country in industry and wealth, sends out a supply of cheaper goods than the native workman can furnish; and so prodigious have been the improvements in machinery, that the raw material of cotton is imported from India, and being manufactured in

Britain, is re-exported and sold at a cheaper rate than it can be made at home, though loaded with the expense of a double voyage across half the globe; and thus it has become an important staple in the trade of Great Britain with the East. A notion was long and successfully propagated by the advocates of the monopoly, that the Hindoos, from their poverty and their simple habits, would never become extensive consumers of European goods, and that the demand was amply supplied by the exports of the East India Company. Evidence to this effect was given before the committee of the House of Commons in 1810 by Sir Thomas Munro and other eminent servants of the Company. But such statements have been completely refuted by the rapidly increasing exportation of British goods to India since the complete opening of the trade in 1834. This will appear from the following table, showing the exports from Hindoostan for a period of 18 years:

VALUE OF EXPORTS FROM GREAT BRITAIN TO HINDOOSTAN, EXCLUSIVE OF BULLION.

The goods exported, as they are enumerated by Mr. Rickards in his valuable work on India, consist of all the staple manufactures of Britain. "Woolens and cottons," he mentions, "of every variety and value; manufactured silks; hardware of all descriptions; iron, copper, lead, tin, and spelta, in large quantities; marine and military stores; machinery for various uses; glass-ware of the metal specimens, down to articles of the commonest use; china-ware or porcelain, the same; jewelry of all sorts; gold and silver plate and ornaments; clocks, watches, furniture, carriages, harness, haberdashery, hosiery, stationery, books; in short, every article of luxury, comfort, or convenience, which British industry can produce." According also to all the most correct observers of Indian manners, the taste for European fashions, luxuries, and comforts, is rapidly extending among the Hindoos. Bishop Heber, in his interesting journal of a tour through India, strongly confirms this fact. "The wealthy natives," he observes, "now all affect to have their houses decorated with Corinthian pillars, and filled with English furniture; they drive the best horses and the most dashing carriages in Calcutta. Many of them speak English fluently, and are toler-

ably read in English literature; and the children of one of our friends I saw one day dressed in jackets and trousers, with round hats, shoes, and stockings." At Benares he found "English hardware, swords, shields, and spears, from Lucknow and Monghyr; and those European luxuries and elegancies, which are daily becoming more popular in India, circulate from hence through Bundelcund, Gorruckpoor, Nepal, and other tracts which are removed from the main artery of the Ganges." At Nussereabad, in the province of Berar, the same traveler mentions that "English cotton cloths, both white and printed, are to be met with commonly in wear among the people of the country, and may, I learn to my surprise, be bought best and cheapest, as well as all kinds of hardware, crockery, writing desks, etc., at Pallee, a large town and celebrated mart in Marwar, on the edge of the desert, several days' journey west of Joudpoor, where, till very lately, no European was ever known to have penetrated." In short, it appears that British and other European manufactures, from their quality and cheapness, are everywhere in demand. They penetrate into the remotest districts of Asia; and now that the termination of the East India Company's

monopoly, which took place in 1834; has laid open Hindoostan to the capital and enterprise of Britain, experience proves that an equal demand for them may be anticipated in that country. The preceding tables contain a view of the extent and value of the trade of India to all parts of the world. The excess of exports over imports arises from the necessity of making annual remittances to Great Britain to defray the interest of debt, and to meet the expenditure of the home government.

Boodawal (Candeish).....	1855	Failure of heirs.....		910	2,727	Not known

The cases in which annexation has been proposed by the government in India, are—Kerowlee (Rajpootana), in 1852, 1800 square miles, having a revenue of 511,402 rupees; Adjy ghur (Bundelcund), in 1855, 340 square miles, 45,000 inhabitants, and a revenue of 175,000 rupees; Inchulkurunjie (Colapore), in 1856, 800 square miles, 43,547 inhabitants, with a revenue of 15,000 rupees; Tanjore Fort and ground adjacent in 1856. See *Annals of British Legislation*, by LEONE

LEVI, July, 1856; *Ency. Brit.*, eighth edition; *Com. Rel. U. S.*, 1856-7.

Revenues of British India 1849-1855.—An abstract statement of the revenues and charges of India, including the charges disbursed in England, for the years 1849-50 to 1854-55 (the last year partly estimated), showing the surplus or deficit in each year converted into sterling money, at the established rate of two shillings the sicca rupee:

Years.	Gross Revenue.	Allowances in accordance with treaties.	Net Revenues.	Charges of collection.	Civil, judicial, military, and marine charges.	Total charges in India.	Charges disbursed in England.	Total charges.	Surplus.	Deficit.

Notwithstanding the ravages committed by incessant wars and revolutions, as well as by famine and pestilence, their usual concomitants, India has from the earliest times been a densely-peopled country. In different states of society, the law of the increase of mankind will vary according to their relative circumstances and position; and the same, or nearly the same, principle will be found to apply to those classes who are placed in the opposite extremities of the scale. Among the people who are possessed of affluence, or the means of commanding the necessaries and comforts of life, the exercise of moral restraint is unnecessary; among those who are reduced to a mere physical subsistence, without the possibility, and consequently without the desire, of improving their condition, it will be disregarded; and hence the same

results will follow from causes in their own nature diametrically opposite. But in India the great mass of the population have for ages been placed in a situation which excludes all idea of improvement; and religion has lent its powerful aid to obstruct the operation of those natural causes which, in other countries, have served to ameliorate the condition of the people. It may, however, be permitted to hope, that though India always has been, it will not always be, what it now is; that the extension of commerce, under the protection of a vigorous and impartial government, will awaken new ideas in the minds of the people; that security to person and property will give a strong stimulus to industry; that the habitual contact with a higher and more rational form of civilization will serve to mitigate their prejudices, and, in time, to destroy the influence of a debasing superstition; and that, in proportion as their wants are multiplied, their efforts to ameliorate their condition will be increased.

Calcutta is the principal city of the province of Bengal, the capital of the British dominions in India, and, with the exception, perhaps, of Canton, the greatest emporium to the eastward of the Cape of Good Hope. Its citadel is in latitude $22^{\circ} 34' 49''$ N., longitude $88^{\circ} 27' 16''$ E. It is about 100 miles from the sea, being situated on the eastern bank of the western branch of the Ganges, denominated by Europeans the Hooghly River, which is the only arm of the Ganges navigable to any considerable distance by large ships. At high water, the river opposite to the town is about a mile in breadth; but, during the ebb, the side opposite to Calcutta, exposes a long range of dry sand-banks. Owing to the length and intricacy of the navigation from the sea, it can not be undertaken without a pilot; so that, even if it did not exceed our limits, it would be useless to attempt any description of it in this place. The principal merchants and traders consist of British and other Europeans, Portuguese, born in India, Armenians, Jews, Persians, from the coast of the Persian Gulf, commonly called Parsees, Moguls, Mohammedans of Hindoostan, and Hindoos; the latter usually either of the Brahminical or mercantile castes, and natives of Bengal. The native Portuguese and Armenian merchants have of late greatly declined in wealth and importance. On the other hand, the Persian merchants have increased in numbers and wealth, several of them being worth £250,000 sterling. The large fortunes of the Hindoo merchants have been much broken down of late years by litigation in the courts, and naturally through the law of equal coparcenary among brothers. To counterbalance this, there has been, since the opening of the free trade in 1814, a vast augmentation of the number of inferior merchants, worth from £20,000 to £50,000 sterling. There are but few Hindoo merchants at present whose wealth exceeds £200,000 sterling. See CALCUTTA.

The sales of opium the last five years at Calcutta alone stand thus:

	Chests sold.	Proceeds realized by sale. Rupees.
1840-50.....	35,333	35,482,079
18 0-51.....	34,409	32,250,839
1852.....	33,561	37,245,185
1853.....	39,463	38,348,038
1854.....	43,819	36,727,534

The price paid to the cultivator is about 240 rupees a chest, the rupee being worth 46 to 50 cents.

This revenue from opium amounts to one seventh of the total income of the empire. Of the £4,000,000 which it represents, £1,000,000 in round numbers is produced by a duty levied in Bombay, and £3,000,000 by the monthly sale of opium in Calcutta. For some years past the average production in Bengal has been 36,000 chests, and the average price of each chest 1050 rupees, or 300 per cent. advance. Two or three years ago, however, the government removed certain restrictions on cultivation. Any body might grow it, to any extent he pleased, though he must still sell it at a

fixed price, settled beforehand, and never altered to the opium agent. The profit on this price is so great that the peasants will cultivate it wherever it will grow. The result was an increase of production, which increased the sales to about 56,000 chests.

Opium fell: the chests which had brought 1050 rupees sold for 630 rupees, and the difference in quantity no longer compensates for the difference in price. The taste of opium, like the taste of tobacco, never leaves its votaries.

The other principal ports are—Bombay, a sea-port on the western coast of British India, lat 18° 56' N., long. 72° 57' E. It is situated at the south-easterly extremity of a small island of same name, separated from the main land by an arm of the sea, forming, with the contiguous islands of Colabah, Salsette, Butchers' and Curiaigh, one of the best harbors in India. The entrance is nearly three miles wide, and has a depth of from 35 to 40 feet.

Madras is the second British Indian presidency, and principal port on the western coast of the Bay of Bengal. It is without port or harbor, lying close to an open roadstead, and the shore having a constant surf. A rapid current runs along the coast, and typhoons are common. Large ships anchor about two miles from shore, in the roads, in from 40 to 60 feet of water, and lighters are used to load and unload freight.

Singapore, a British settlement on an island of the same name, at the eastern extremity of Malacca, lat. 1° 17' 22' N., long. 103° 51' 45' E.

United States and the East Indies.—The commercial intercourse of the United States with the territories of the East India Company is regulated by the different local governments thereof, under the supreme control and approval of the Governor-General of India in council. The regulations prescribed by these authorities are not of a permanent character, being liable to modifications and changes whenever, in their opinion, such become necessary. To present, however, the true basis upon which this intercourse rests, it will be necessary to refer briefly to the treaty stipulations subsisting between the governments of the United States and Great Britain; premising, that prior to the convention of London, signed on the 3d of July, 1815, between the United States and Great Britain, the commercial intercourse of the former with the East India possessions was regulated, as was that of other foreign nations, by a general clause in the Company's charter, providing that "vessels of countries in amity with Great Britain may import into, and export from, the British possessions in India, such goods and commodities as may be specified in rules to be prescribed by the East India Company; provided that such rules shall not be inconsistent with any treaty now [then] made, or which may be made between Great Britain and any foreign State in amity with her, or with any act of Parliament for regulating the affairs of India." By the convention above referred to, and the subsequent

convention of October, 1818, continuing the former, it was stipulated:

1st. That vessels of the United States shall be admitted and hospitably received at the principal settlements of the British dominions in the East Indies, viz.: Calcutta, Madras, Bombay, and Prince of Wales' Island; and the citizens of the United States may freely trade between the said settlements and the United States, in all articles of which the importation and exportation, respectively, to and from the said territories, shall not be entirely prohibited; and, 2d, it was provided, that the citizens of the United States shall pay for their vessels, when admitted, no higher or other duty or charges than shall be payable on the vessels of the most favored European nation. And they shall pay no higher or other duties or charges on the importation or exportation of the cargoes of said vessels than shall be payable on the same article when imported or exported in the vessels of the most favored nation; and, 3d, It was expressly agreed, that the vessels of the United States shall not carry any article from the said settlements to any port or place, except to some port or place in the United States of America, where the same shall be unladen.

This convention is still in force, and regulates the commercial intercourse of the United States with the East India possessions, except as to paragraph 3, which has been superseded by the repeal of the British navigation laws in 1849; the effect of which has been to open the ports of Great Britain, and of all her colonial possessions abroad, to "goods of any sort, in a ship of any country, from any part of the world." By an act of the imperial Parliament, entitled 13 Victoria, chap. xxix., secs. 3, 4, 5, 6, the Governor-General of the East India possessions was clothed with full powers to admit, whenever he should deem it advisable so to do, to the coasting trade in the East Indies, the vessels of all foreign nations. This privilege is now enjoyed by every flag. With these two exceptions, the convention of 1818 is still in full force, and constitutes the only guaranty which the United States possesses of equal privileges with the most favored nation in its intercourse and commerce with the East India possessions. Notwithstanding the express stipulations contained in the treaty above referred to, that the East India Company should prescribe no regulations "inconsistent with any treaty now made, or which may be made, by Great Britain, with any nation in amity

with her," it has, on more than one occasion, been represented to the Department of State that the officers of this Company do not consider themselves bound by the commercial treaties which exist between the United States and England." The dispatch from which the foregoing extract is taken further says, that "the speedy settlement of this question is deemed of paramount importance to the commercial interests of the United States." No case, however, having been presented to the Department, beyond the naked asser-

tion of the *quasi* independent sovereignty by the officers of the East India Company, the necessity has not yet arisen for an examination of the grounds upon which this claim is based. As the question may, however, hereafter embarrass the commercial relations of the United States with this portion of her Britannic majesty's possessions, it has been deemed proper to present the facts in relation to it, which have come to the knowledge of the Department. See *Commercial Relations U. S.*

The whole number of arrivals in the United States from the East Indies during the year 1856 were 226. In 1855, 168. At Boston, 133; New York, 82; Salem, 7; Philadelphia, 2; Providence, 1; Savannah, 1.

At Boston, in 1856, 133. In 1855, 100. From Calcutta, 77; Manilla, 22; Cape Town, 9; Singapore, 4; Padang, 4; Penang, 2; Batavia, 2; Mauritius via London, 1; Foo Chow Fow, 2; Whampoa, 1; Hong Kong via New York, 1; Padang via New York, 1; Singapore via Rotterdam, 1; Canton, 1; Canton via London, 1; Sumatra, 1; Shanghai via New York, 1; Calcutta via London, 1.

At New York, in 1856, 82 (of which 50 belonged to Boston and ports east of New York). In 1855, 59. From Manilla, 15; Shanghai, 14; Singapore, 12; Foo Chow Fow, 9; Calcutta, 9; Hong Kong, 6; Whampoa, 5; Penang, 5; Canton, 4; Calcutta via London, 1; Foo Chow Fow via Havana, 1; Swatow via Havana, 1.

At Salem, in 1856, 7. In 1855, 6. From Zanzibar, 5; Penang, 1; Manilla, 1.

At Philadelphia, in 1856, 2. In 1855, 4. From Calcutta, 1; Calcutta via London, 1.

At Providence, 1 from Zanzibar.

At Savannah, 1 from Calcutta via Liverpool.

Clearances.—The whole number of clearances in the United States for the East Indies were 161. In 1855, 172. At Boston, 96; New York, 40; Salem, 8; New

Orleans, 6; Providence, 3; Philadelphia, 2; Baltimore, 2; Mobile, 2; Portland, 1; Newburyport, 1.

At Boston, in 1856, 96. In 1855, 75. For Calcutta, 28; Batavia, 10; Cape Town, 14; Manilla, 6; Bombay, 5; Hong Kong, 4; Calcutta via Buenos Ayres, 5; Madras and Calcutta, 3; Akyab, 3; Madras, 3; Sumatra, 2; Singapore, 4; Calcutta via London, 2; Calcutta via Liverpool, 1; Zanzibar via Providence, 1; Padang, 1; Columbo, 1; Whampoa, 1.

At New York, in 1856, 40 (of which 24 traded from Boston and ports east of New York). In 1855, 50. For Hong Kong, 9; Calcutta, 5; Shanghai, 4; Cape Town, 3; Canton, 8; Batavia, 2; Calcutta, via Buenos Ayres, 3; Sumatra, 2; Bombay, 2; Mauritius, 1; Singapore, 1; Anjer, 1; Akyab, 1; Siam, 1; Padang, 1.

At Salem, in 1856, 9. In 1855, 8. For Zanzibar, 7; Batavia, 1; Penang, 1.

At New Orleans, 6. Last year, 24. For Calcutta via Liverpool, 5; Bombay via Liverpool, 1.

At Providence, 3 for Zanzibar. Last year, 1.

At Philadelphia, 2. Last year, 4. For Calcutta, 1; Manilla, 1.

At Baltimore, 2 for Cape Town. Last year, 3.

At Mobile, 2 for Calcutta. Last year, 0.

At Newburyport, 1 for Calcutta. Last year, 0.

At Portland, 1 for Calcutta via Buenos Ayres. Last year, 1. See *Annals Brit. Leg.*, July, 1856, p. 25, "Territories Annexed."

The British East India possessions embrace an almost boundless extent of territory, extending from the Himalaya range of mountains on the north to the ocean, including nearly the whole of the peninsula of Hindoostan, the island of Ceylon, and that portion of Burmah lying between 20° of north latitude and the Bay of Bengal. These vast possessions are supposed to contain a population of 152,000,000 of souls. The East India Company's possessions comprise the several presidencies of, 1st, the Bengal presidency; 2d, the Bombay presidency; 3d, the Madras presidency; 4th, the Agra presidency; and the several dependencies of each of these presidencies.

Bengal.—The commerce of the United States with the East Indies is principally confined to the presidencies of Bengal and Bombay, and to a few of their dependencies. The leading exports from the East India possessions to the United States are wool, oil-seeds, hides, medicinal drugs, sandal-woods, gums, spices, horns, indigo, ivory, coir, saltpetre. The principal exports from the United States to the East Indies are, tobacco, naval stores, provisions, ice, and miscellaneous merchandise, copper, pitch, tar, rosin, pine-boards, and spars. Number of American vessels entered the port of Calcutta in 1852, 65; tonnage, 34,849. Number of vessels cleared from Calcutta in the same year, 101; tonnage, 59,340. In 1853, 109 vessels from the United States entered this port. See CALCUTTA, BENGAL, and GREAT BRITAIN.

Imports from Calcutta, 1851–1853, \$9,676,072; value of exports during the same period, \$1,490,399; apparent balance against the United States, \$8,185,673. This heavy balance apparently against the United States is accounted for by the large discriminating duties on all its manufactures, in favor of similar merchandise imported from the mother country. American vessels usually enter the ports of Calcutta and Bengal in ballast, for the purpose of taking in a home-ward cargo.

Bombay.—Exports from Bombay the same as from Calcutta. The same description of merchandise is imported from the United States. The following market prices at Bombay will show that the articles specified might enter advantageously into American exports, not only to that port, but to the other ports in the East Indies: Copper sheathing sells at 55 rupees, or \$27 25 per cwt.; duty, 10 per cent; annual imports, 400 tons. Copper bolts sell at 50 rupees, or \$25 per cwt., duty, 10 per cent; annual imports, 700 tons. Pitch, 4 rupees = \$1 50 per barrel; annual imports, 1000 barrels; duty 10 per cent. Tar, 4 rupees = \$2 per barrel; annual imports, 620 barrels; duty, 10 per cent. Tonnage duty in Bombay, 1–16 rupee, or nearly 8 cents per ton. Light-house dues on ships from 15–20 rupees = from \$7 50 to \$10, according to the nature of the cargo and time of the year. The rupee is valued by Pope at 46 cents: consular returns from Bombay value it at 50 cents.

Pilotage is regulated by the season, and is as follows:

Vessels of	From Sept. to June.	From June to Sept.
Tons.	Ruppes. Dollars.	Ruppes. Dollars.
100—800.....	50 = 25 00	75 = 37 25
200—400.....	55 = 27 25	80 = 40 00
400—600.....	60 = 30 00	85 = 42 25
500—500.....	65 = 32 25	90 = 45 00
600—700.....	70 = 35 00	95 = 47 25
700—800.....	75 = 37 25	100 = 50 00
800—900.....	80 = 40 00	105 = 52 25
900—1,000.....	85 = 42 25	110 = 55 00
1,000—1,100.....	120 = 60 00	145 = 72 25
1,100—1,200.....	130 = 65 00	155 = 77 25
1,200—1,300.....	140 = 70 00	165 = 82 25
1,300—1,400.....	150 = 75 00	175 = 87 25
1,400—1,500.....	160 = 80 00	185 = 92 25
1,500—1,600.....	170 = 85 00	195 = 97 25

The above rates are regulated by the local government of the Company's possessions, and the pilots are regularly licensed. See articles BOMBAY and EAST INDIA COMPANY.

The following table exhibits the trade of the United States with the East Indies generally:

Exports to East Indies:	1853.	1854.
Domestic manufactures.....	\$503,556	\$567,193
Foreign.....	63,542	69,219
Total.....	567,398	636,412
Imports from.....	8,561,726	5,878,321
Excess of imports over exports.	8,014,328	4,741,909

For Commerce, etc., of East India, see *Ed. Rev.*, xlviii., 312, 336, lxxii., 181, lxx., 157 (MACAULAY), xxix., 335; *Chr. Exam.*, xlviii. (E. PEABODY); *Westm. Rev.*, ii. 326; *For. Quar.*, xxiii., 93 ("British Usurpation"), xxxv., 382, xxxvi., 306.

Indian Ocean, Indicum Mare, a vast oceanic basin, separated from the Pacific on the east by the Asiatic Archipelago and Australia, bounded on the south by a line drawn from the Cape of Good Hope to Bass' Strait, divided from the Atlantic by Africa on the west, and inclosed by the countries of Asia on the north. It communicates with the Chinese Sea by the Strait of Malacca, Sunda Strait, and the Strait of Flores. Principal inlets, the Bay of Bengal, the Sea of Oman, the Persian Gulf, and the Red Sea. Chief straits, the Channel of Mozambique, and Palk's Strait. The most important islands are Madagascar, Mauritius, Bourbon, the Comoro Islands, Seychelles, and Socotra, belonging to Africa; the Laccadives, Maldives, Ceylon, the Andaman and Nicobar Islands, to Asia. Its principal affluents are, in Asia, the Saluen, Irrawadi, Brahmaputra, Ganges, Godavery, Kistna, Nerbudda, Indus, and the Shat-el-Arab, formed by the junction of the Tigris and Euphrates; in Africa, the Zambeze. The chief sea-ports are, Calcutta and Bombay in India; Malacca, in the Asiatic Archipelago; Aden, Mocha, and Muscat, in Arabia; Zanzibar, etc., in Africa. Steam-packets are established between the principal ports. The monsoons, or periodical winds, prevail in the north part of the ocean, blowing from the south-west between April and October, and south-east from October to April. Tempests are general at the periods of change, and between lat. 5° and 40° S. violent hurricanes frequently occur.

Indiana, one of the United States of North America, is bounded east by the State of Ohio, south by the River Ohio, which separates it from Kentucky, west by Illinois, from which it is partly separated by the Wabash River, and north by Michigan and Lake Michigan. It lies between 37° 51' and 40° 46' N. lat., and 85° 49' and 88° 2' W. long. Extreme length from north to south, 276 miles; greatest breadth, 175 miles. Area, 33,809 square miles.

Indiana may be generally characterized as a great plain, inclining toward the south-west. A range of hills extends along the Ohio from the mouth of the Great Miami to Blue River, and the shore of Lake Michigan is lined by large sandy hills, which rise to a height of 200 feet. In some other parts are to be found "knobs," but these are seldom of great extent or elevation. The surface of the country naturally divides itself into several extensive river valleys. The valley of the Ohio, comprising an area of about 5500 square miles, is a limestone tract, and was originally covered with forests. About one third of it is rugged and broken, so as to be unfit for cultivation. The White River Valley, extending through the centre of the State, from the Wabash to the Ohio, contains about 9000 square miles. This district is almost uniformly level, and richly wooded, except in the west, where there are some ranges of low rugged hills, and several patches of prairie ground. The soil is of the richest kind. The Wabash Valley is much larger than the others, and contains upward of 12,000 square miles. The eastern portion equals the White River Valley in fertility, but the other parts are not so productive. The northern part of the State, watered by the St. Joseph and the Kankakee Rivers, is somewhat more

swampy than the Wabash Valley; and a large tract, comprising the sand-hills on Lake Michigan, is covered only with stunted pines and burr oaks.

The State is well watered by numerous beautiful streams and rivers, but with the exception of the Ohio and Wabash, few of them are navigable. The Wabash is the largest river that has its course mainly within the State, and, together with its branches, drains three fourths of the entire surface. It rises in the west of Ohio, and flows first in a north-west direction, and then south-west till it meets the boundary of Illinois, which it follows southward for more than 100 miles, till it falls into the Ohio, after a course of upward of 500 miles; for 400 of which it is navigable for steamboats at high water. The Ohio forms the entire southern boundary of the State. The other principal rivers of Indiana are tributaries of the Wabash. The White River, the most important of these, is formed by the West and East Forks—two rivers, respectively about 300 and 200 miles long—which unite about 100 miles above its confluence with the Wabash. The Miami is formed by the St. Joseph and St. Mary in the north-east, and falls into the Ohio. The Upper St. Joseph, with its tributaries, passes through the northern counties, and falls into Lake Michigan.

Indiana resembles the other western States north of the Ohio in climate. They are generally milder than those on the Atlantic coasts, but very subject to sudden changes. The winter is very severe in the northern parts, but more genial in the southern. Except in the neighborhood of wet prairies and swamps, the climate is everywhere healthy. Dr. Owen, speaking of the geological position of Indiana, remarks, that "it possesses all the elements of extraordinary fertility." The richest soil is that of the river bottoms, where it is very deep and exceedingly fertile. The most productive are those inclosed by the river hills, which run parallel to the Ohio and other rivers. The extensive valley of the Wabash is a tract of this description. Behind the river hills, a table-land spreads out, forming what may be called the interior of the country, and here, instead of the bottom-lands, or river valleys, there are vast prairies. The soil of these is not so luxuriant, but is such as amply to repay the expense of culture. Even the wet and marshy parts of the State admit of being brought under cultivation. Indiana ranks fourth of the States of the Union in the absolute amount of Indian corn raised. It also produces large quantities of wheat, oats, and Irish potatoes, as well as a fair proportion of the other productions common to the western States.

The number of farms in Indiana under cultivation in 1850 comprised 93,896 acres, and the extent of improved land was 5,046,543 acres; of unimproved, 7,746,879 acres. The value of the farms returned was \$135,000,000. The orchard produce was estimated at \$822,000, and market-garden products, \$71,000.

The chief minerals of Indiana are coal, iron, lime, marble, freestone, and some copper. Of these the first is by far the most important. It has been estimated that the coal beds of Indiana cover 7700 square miles, and are capable of yielding 50,000,000 bushels to the square mile. One coal deposit commences in Perry county, and extends north-west into the county of Vermilion upward of 150 miles.

The manufacturing capital of Indiana in 1850 amounted to \$7,941,602. The value of raw material, etc., consumed in the year had been \$10,214,337. The products were valued at \$18,922,651. There were on June 1, 1850, 4526 industrial establishments, producing annually to the value of \$500 and upward. Of these, 2 were cotton factories, 23 woolen factories, 19 iron works, and 368 tanneries.

Indiana has no direct foreign commerce, but it has a considerable transit trade, and exports large quantities of agricultural produce. The facilities for internal communication are great, and rapidly increasing.

The principal canals are the Wabash and Erie Canal between Evansville, on the Ohio, and Toledo, on Lake Erie, 467 miles, of which 379 miles are in Indiana; and the White Water Canal, 68 miles long, uniting Lawrenceburg, on the Ohio, with Hagerstown. In 1853 the State had 755 miles of railroad completed, and 979 in course of construction. The principal railroads centre in Indianapolis, and radiate from that city in all directions. See DE BOW'S *Rev.*, i., 512, vii., 246; *Bankers' Mag.*, iii., 164; HUNT'S *Mer. Mag.* xxi., 147.

Indian Ink. A species of ink used in Europe for the lines and shadows of drawings. It is principally manufactured in China, and there used for writing. From the experiments of Dr. Lewis, it appears to be a compound of fine lampblack and animal glue. See **INK**.

India-rubber. Also called caoutchouc, first brought to Europe from South America. Several plants produce various kinds of elastic gum; but that in commerce is chiefly the juice of the *Siphonia Elastica*, or syringe-tree. Incisions in the bark of this tree give vent to a liquid which forms India-rubber. No substance is yet known which is so pliable, and at the same time so exceedingly elastic; it oozes out under the form of a vegetable milk, from incisions made in the tree, and is gathered chiefly in the time of rain, because it flows then most abundantly.—*M. Macquer*.

The most astonishing and useful discovery of the 19th century, after the practical application of steam and electricity, is the employment of India-rubber for manufacturing purposes. The first knowledge of it is due to La Condamine, a French philosopher, who in 1730 was sent by his government to Peru to measure an arc of the meridian. The tree which produces rubber or *caoutchouc* (as it is called by the natives of South America), is found in the tropics of both hemispheres. It rises to the height of 50 or 60 feet, without branches, and is crowned or tufted with glossy foliage. The leaves are a deep green, thick and glossy; six or seven inches in length; the bark is smooth, and the fruit consists of white almonds, of an agreeable flavor, much liked by the natives. In order to obtain this substance, the natives of the valley of the Amazon make a longitudinal gash in the bark of the tree with a narrow hatchet; a thick, white and oily liquid (a sort of vegetable milk) flows out, a wedge of wood is inserted to keep the gash open, and a small clay cup is stuck to the tree beneath the gash. In four or five hours the milk ceases to run, and each wound has yielded from three to five table-spoonfuls. The "se-ringero," or rubber gatherer, then empties the contents of the cups into an earthen vessel and commences the operation of forming it into shapes and smoking it. This must be done at once as the milk soon coagulates. A fire is made on the ground, of nuts of the wassou palm tree, over which is placed, inverted, an earthen pot with a hole in the bottom whence issues a jet of pungent smoke. Molds are made either of clay or wood, which are dipped into the milk, and then passed slowly through the hot smoke. When the required thickness is obtained, the molds are cut or washed out. Smoking changes the color of the rubber very little, but by exposure to the sun and atmosphere it becomes brown, and in time black. The superiority of the rubber imported from the valley of the Amazon is said to be owing to the peculiar properties of the smoke of this nut, no other smoke producing a similar effect upon the gum. A belt of forest trees extends 10 degrees each side of the equator, which yield India-rubber of various kinds; so the supply is literally inexhaustible. The gum from India and the Pacific coast of South America is obtained by allowing the sap to flow down the side of the tree, and is then gathered with the loose bark and dirt into *ceroons* or bundles for shipment. For a long time this substance was valued simply as an object of curiosity, to be preserved

in collections of natural history, and its first practical application was as an eraser of pencil marks.

STATEMENT SHOWING THE EXPORTS OF INDIA-RUBBER FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30TH, 1856.

About the year 1821, Charles Macintosh of England, having learned how to dissolve the gum in spirits of turpentine, commenced manufacturing the goods which now bear his name, by spreading the gum so dissolved between two layers of cloth. The rude overshoes made by the natives in South America from the natural gum, were beginning to be worn, and in 1823, 500 pairs of shoes were imported into Boston. At a later date gum-elastic became the subject of scientific investigation and many persons commenced experimenting with it. In 1832, the considerable manufacture of it was commenced in Massachusetts, by John Haskins and Edwin M. Chaffee, who, in connection with others,

started the celebrated Roxbury India-rubber Company, which was shortly after incorporated with a capital of \$400,000. For this Company Mr. Chaffee invented the famous mammoth machine for spreading rubber without a solvent—the machine itself costing nearly \$30,000. Similar machines are now required by all manufacturers of rubber goods. The apparent prosperity of this Company induced the starting of factories in Boston, Chelsea, Woburn and Framingham, Mass., New York city, Staten Island, and Troy, N. Y., with capitals of from \$50,000 to \$500,000. These Companies made their goods by dissolving the rubber in camphene or other solvents, then mixing lampblack with it, and while in the form of paste spreading it on cloth from which coats, etc., are made. The goods were then dried in the sun or in a warm room until the solvent evaporated, leaving a coating of rubber. See GUTTA PERCHA.

Indies, Dutch. See JAYA.

Indigo (Fr. *Indigo*; Ger. *Indigo*; Sans. *Nili*; Arab. *Neel*; Malay, *Taroom*), the drug which yields the beautiful blue dye known by that name. It is obtained by the maceration in water of certain tropical plants; but the indigo of commerce is almost entirely obtained from leguminous plants of the genus *Indigofera*; that cultivated in India being the *Indigofera tinctoria*; and that in America the *Indigofera anil*. The Indian plant has pinnate leaves and a slender ligneous stem; and when successfully cultivated, rises to the height of three, five, and even six feet. Before the American colonies were established, all the indigo used in Europe came from the East Indies; and until the discovery of a passage round the Cape of Good Hope, it was conveyed, like other Indian products, partly through the Persian Gulf, and partly by land to Babylon, or through Arabia and up the Red Sea to Egypt. The real nature of indigo was so little known in Europe, that it was classed among the minerals, as appears by letters-patent for erecting works to obtain it from mines in the principality of Halberstadt, dated December 23, 1705; yet what Vitruvius and Pliny call *indicum* is supposed to have been our indigo.—BECKMANN. The first mention of indigo occurs in English statutes in 1581. The first brought to Europe was procured from Mexico. Its cultivation was begun in Carolina, in 1747. It appears pretty certain that the culture of the indigo plant, and the preparation of the drug have been practiced in India from a very remote epoch. It has been questioned, indeed, whether the *indicum* mentioned by Pliny (*Hist. Nat. lib.*, xxxv., c. 6), was indigo, but, as it would seem, without any good reason. Pliny states that it was brought from India; that when diluted it produced an admirable mixture of blue and purple color (*in diluendo misturam purpure corvuleque mirabilem reddit*); and he gives tests by which the genuine drug might be discriminated with sufficient precision. It is true that Pliny is egregiously mistaken as to the mode in which the drug was produced; but there are many examples in modern as well as ancient times, to prove that the possession of an article brought from a distance implies no accurate knowledge of its nature, or of the processes followed in its manufacture. Beckmann (*Hist. of Inventions*, vol. iv., art. INDIGO), and Dr. Bancroft (*Permanent Colors*, vol. i., pp. 241, 252), have each investigated this subject with great learning and sagacity; and agree in the conclusion that the *indicum* of Pliny was real indigo, and not, as has been supposed, a drug prepared from the *isatis* or woad. At all events, there can be no question that indigo was imported into modern Europe, by way of Alexandria, previously to the discovery of the route to India by the Cape of Good Hope. When first introduced, it was customary to mix a little of it with woad to heighten and improve the color of the latter; but, by degrees, the quantity of indigo was increased; and woad was, at last, entirely superseded. It is worth while, however, to

remark, that indigo did not make its way into general use without encountering much opposition. The growers of woad prevailed on several governments to prohibit the use of indigo! In Germany, an imperial edict was published in 1654, prohibiting the use of indigo, or "*devil's dye*," and directing great care to be taken to prevent its clandestine importation, "because," says the edict, "the trade in woad is lessened, dyed articles injured, and money carried out of the country!" The magistrates of Nuremberg went further, and compelled the dyers of that city to take an oath once a year not to use indigo; which practice was continued down to a late period. In 1598, upon an urgent representation of the States of Languedoc, at the solicitation of the woad growers, the use of indigo was prohibited in that province; and it was not till 1787, that the dyers of France were left at liberty to dye with such articles, and in such a way, as they pleased.—BECKMANN, vol. iv., p. 142. Let not those who may happen to throw their eyes over this paragraph, smile at the ignorance of their ancestors—*Mutato nomine, de te fabula narratur*. How much opposition is made in most countries at this moment to the importation of many important articles, for no better reasons than were alleged in the 16th century against the importation of indigo!

Indigo is produced in Bengal, and the other provinces subject to the presidency of that name, from the 20th to the 30th degrees of north latitude; in the province of Tinnevely, under the Madras government; in Java; in Luconia, the principal of the Philippine Islands; and in Guatemala, and the Caraccas, in Central America. Bengal is, however, the great mart for in-

digo; and the quantity produced in the other places is comparatively inconsiderable.

Raynal was of opinion that the culture of indigo had been introduced into America by the Spaniards; but this is undoubtedly an error. Several species of *indigofera* belong to the New World; and the Spaniards used it as a substitute for ink, very soon after the conquest. (HUMBOLDT, *Nouvelle Espagne*.) For the first 20 years after the English became masters of Bengal, the culture and manufacture of indigo, now of such importance, was unknown as a branch of British industry; and the exports were but trifling. The European markets were, at this period, principally supplied from America. In 1788, however, the attention of the English began to be directed to this business; and though the processes pursued by them be nearly the same with those followed by the natives, their greater skill, intelligence, and capital give them immense advantages. In their hands, the growth and preparation of indigo has become the most important employment, at least in a commercial point of view, which can be freely carried on in the country, the culture and preparation of opium being a monopoly. The indigo made by the natives supplies the internal demand; but a portion of that which is raised by them, with all that is raised by Europeans, is exported. In the Delta of the Ganges, where the best and largest quantity of indigo is produced, the plant lasts only for a single season, being destroyed by the periodical inundation; but in the dry central and western provinces, one or two *ratoon* crops are obtained; and owing to this circumstance, the latter are enabled to furnish a large supply of reed to the former.

It deserves to be remarked, that since the opening of the trade, Indian capitalists have betaken themselves to the manufacture of indigo on the European method, and that at present a considerable part of the whole annual produce is prepared by them. The culture of indigo is very precarious, not only in so far as respects the growth of the plant from year to year, but also as regards the quantity and quality of the drug which the same amount of plant will afford even in the same season. Thus the produce or 1825—26 was 41,000 chests, while that of 1826—7 was but 25,000 chests; and in 1842 the produce was only 79,000 maunds, while that of the following year was no less than 172,249 maunds! The price of indigo in India, increased for a while, in a far greater ratio than the quantity. In 1813—14, the real value of that exported from Calcutta was £1,461,000; but in 1827—28, although the quantity had increased but 20 per cent., the value rose to £2,920,000, or was about doubled. There was no corresponding rise in the price in Europe, but, on the contrary, a decline; and the circumstance is to be accounted for by the restraints that were then placed on the investment of capital in the production of colonial articles suited to the European market, the consequent difficulty of making remittances from India, and an unnatural flow of capital to the only great article of Indian produce and export that was supposed

capable of bearing its application. The consumption of indigo has varied but little in England during the last 10 years, having been, at an average of that period, about 2,000,000 lbs. a year. This stationary demand, notwithstanding the fall in the price of the drug and the increase of population, is principally to be ascribed to the decreasing use of blue cloth, in the dyeing of which it is principally made use of. Its consumption in France is about as great as in Britain. Besides the exports to Great Britain, France, and the United States, a good deal of Bengal indigo is exported to the ports on the Persian Gulf, whence it finds its way to southern Russia. It is singular that it is not used by the Chinese, with whom blue is a favorite color. The indigo of Bengal is divided into two classes, called, in commercial language, *Bengal and Oude*; the first being the produce of the southern provinces of Bengal and Bahar, and the last that of their northern provinces and of Benares. The first is, in point of quality, much superior to the other. This arose at one time, in a considerable degree, from the practice which prevailed in the northern provinces, of the European planter purchasing the wet fecula from the Ryot or native manufacturer, and completing the processes of curing and drying the drug. This is at present in a great measure discontinued; and the Oude indigo has, in consequence, considerably improved in quality. Its

inferiority is probably more the result of soil and climate, than of any difference in the skill with which the manufacture is conducted.

The following is believed to be a pretty accurate estimate of the annual production of indigo in India, in maunds of 82 lbs.:

	1842.	1843.	1844.	1845.	1846.	1847.	1848.	1849.	1850.	1851.	Average.

Total.....	79,000	172,249	143,207	127,862	101,325	110,000	126,565	121,270	112,522	125,000	121,899

In addition to the exports from India, indigo is exported from Java, the Philippine Islands, Central America, and other places. In 1845 the exports from Batavia amounted to 1,653,869 lbs., and, we believe, they have varied but little in the interval. In 1850 the exports from Manilla were estimated at about 450,000 lbs. According to Humboldt, 1,800,000 lbs. of indigo were exported from Guatemala in 1825. But if so, its production must have fallen off greatly in the interval. It does not now probably exceed 500,000 lbs. in all Central America. Indigo is also produced in some of the West India islands, but in small quantities. Good indigo is known by its lightness or small specific gravity, indicating the absence of earthy impurities; by the mass not readily parting with its coloring matter when tested by drawing a streak with it over a white surface; but above all, by the purity of the color itself. The first quality, estimated by this last test, is called, in commercial language, *fine blue*; then follow *ordinary blue*, *fine purple*, *purple and violet*, *ordinary purple and violet*, *dull blue*, *inferior purple and violet*, *strong copper*, and *ordinary copper*. These distinctions refer to the Bengal indigo only, the Oude being distinguished only into *fine* and *ordinary*. The indigo of Madras, which is superior to that of Manilla, is about equal to ordinary Bengal indigo. The indigo of Java is superior to these.

We subjoin an account of the prices of Bengal indigo of medium quality, at the quarterly sales in London, from 1847 to 1851, both inclusive:

For further information as to indigo, see COLEBROOKE'S *Husbandry of Bengal*, p. 154; MILBURN'S *Orient. Com.*; WILKINSON'S *Commerce of Bengal*; WILSON'S *Review of do.*; evidence of Gillian MacLaine, Esq., East India Committee, 1830-31, etc. The fixed capital required in the manufacture of indigo consists of a few vats of common masonry for steeping the plant, and precipitating the coloring matter; a boiling and drying-house; and a dwelling-house for the planter. These, for a factory of 10 pair of vats, capable of producing, at an average, 12,500 lbs. of indigo, worth on the spot about £2500, will not cost above £1500 sterling. The buildings and machinery necessary to produce an equal value in sugar and rum, would probably cost about £4000. This fact, therefore, without any reference to municipal regulations, affords a ready answer to the question which has been frequently put, why the planters in India have seldom engaged in the manufacture of sugar in preference to that of indigo.

Cultivation of American Indigo.—At the present moment, and for the past two years, the supply of the first quality indigo has not been equal to the demand for it, and that demand is constantly increasing. Some very excellent indigo, well adapted for making chymic, used to be obtained from Guatemala, but the kind most esteemed is the first quality of Bengal, for which we are dependent on a colony of Great Britain. About 12 years ago the best Bengal indigo could easily be obtained, but at present it is almost unknown in the

market. A spurious article, however, much resembling it, is abundant, but it does not possess one half the coloring matter of the genuine, and yet it is sold at a retail price varying from 6s. to 14s. per pound. Our object is to direct the attention of our southern planters to the cultivation of the indigo plant, and the manufacture of the best kinds of indigo, for the inferior kinds are by far too plenty. About 60 years ago, and within that period, some very fine qualities of indigo used to be cultivated in South Carolina; its character was much higher than the finest Guatemala or the best Bengal, but it is now unknown in the arts, to the great regret of calico-printers, dyers, and leather-dressers. In the fermentation of the indigo-plant so much oxygen is absorbed, that its manufacture was found to be very injurious to the health of the negroes on the plantations. This was one reason for giving up its culture; and another, and perhaps the strongest, was the higher profits derived from the cultivation of cotton. It appears to us now, however, that with exercise of sufficient care, the health of the negroes may be maintained as well as in the rice culture: also that the price which could now be obtained for it would be very remunerative. There are hundreds of persons in our country who would rather pay \$2 per pound for the best kind of indigo—that quality which was manufactured at one time in South Carolina, or the kind that was sold for the best Bengal 12 years ago—than that which is now sold for 75 cents per pound. We think these considerations ought to induce some of our planters to engage in the cultivation of the finest qualities of indigo. See HUNT'S *Mer. Mag.*, xiii., 227; *Jour. of Sci.*, xviii., 237; *Ency. Bri.*

Indorsement.—*The Law of Indorsement, and the Rights and Duties of an Indorser.*—Only a note or bill payable to a payee or order, is, strictly speaking, subject to indorsement. Those who write their names on the back of any note or bill, are indorsers in one sense, and are sometimes called so. The payee of a negotiable bill or note—whether he be also maker or not—may indorse it, and afterward any person, or any number of persons may indorse it. The maker promises to pay to the payee or his order; and the indorsement is an order to pay to the indorsee, and the maker's promise is then to him. But if the original promise was to the payee or order, this "or order," which is a negotiable element, passes over to the indorsee, and he may indorse, and so may his indorsee, indefinitely. Each indorser, by his indorsement, does two things; first, he orders the antecedent parties to pay to his indorsee; and next, he engages with his indorsee that if they do not pay, he will. What effect an indorsement of a negotiable note or bill, by one not payee, before the indorsement by payee, should have, is not quite certain. Upon the whole, however, we should hold, with some reason and authority, that where such a name appears, as it may be made to have the place of a second indorser whenever the payee chooses to write his name over it, it shall be held to be so intended, in the absence of evidence; and then, of course, it gives the payee no claim against such a party, because a first indorser can have none against a second, but the second may have a claim against the first. But evidence is receivable to prove that the party put his name on the note for the purpose of adding to its security, by becoming responsible for it to the payee. And then, if he indorse the note before it was received by the payee, the consideration of the note attaches to him, and he may be held either as surety for consideration or as a maker. If he wrote his name on the note after it was made, and, at the request of the payee or other holder, he is bound only as a guarantor or surety, and the consideration of the note being exhausted, he is bound only by showing some new and independent consideration. No one who thus indorses a note not negotiable can be treated or considered precisely as a second indorser, whatever be the names on the paper before his own; but any indorser of such a note or bill may be held to be a new maker or drawer, or a guarantor or surety, as the circumstances of the case indicate or require; but either the original consideration or a new one must attach to him to affect him with a legal obligation.

If the words "to order," or "to bearer," are omitted accidentally and by mistake, it seems they may be afterward inserted without injury to the bill or note; and whether a bill or note is negotiable or not, is held to be a question of law. By the law-merchant, bills and notes which are payable *to order* can be effectually and fully transferred only by indorsement. This indorsement may be *in blank* or *in full*. The writing of the name of the payee—either the original payee or an indorsee—with nothing more, is an indorsement in blank, and a blank indorsement makes the bill or note transferable by the delivery, in like manner as if it had originally been paid to bearer. If the indorsement consists not only of the name, but of an order above the name, to pay the note to some specified person, then it is an indorsement in full, and the note can be paid to no one else; nor can the property in it be fully transferred, except by the indorsement of such indorsee; and he may again indorse it in blank or in full. If the indorsement is paid to A B *only*, or its equivalent words, A B is indorsee, but can not indorse it over.

Any holder for value of a bill or note indorsed in blank, whether he be the first indorsee or one to whom it has come through many hands, may write over any name indorsed an order to pay the contents to himself, and this makes it a special indorsement, or an indorse-

ment in full. This is often done for security, that is to guard against the loss of the note by accident or theft. For the rule of the law is, that negotiable paper, transferable by delivery (whether payable to bearer or indorsed in blank), is, like money, the property of whoever receives it in good faith. The same rule has been extended, in England, to exchequer bills, to public bonds payable to bearer, and to East India bonds; and we think it would extend here to our railroad and other corporation bonds; and, perhaps, to all such instruments as are payable to bearer, whether sealed or not, and whatever they may be called. If one has such an instrument, and it be stolen, and the thief passes it for consideration to a *bonâ fide* holder, this holder acquires a legal right to it, because the property and possession go together. But if the bill or note be specially indorsed, no person can acquire any property in it, except by the indorsement of the special indorsee. It is said, however, that this precaution protects only the party who has thus made himself a special indorsee, and that the former parties remain liable in the same way as if the indorsement continued blank.

At one time this acquirement of property in negotiable paper was defeasible by want of proof or care; that is, if a holder lost his note, and a thief or finder passed it off to a *bonâ fide* holder, the property did not pass, if the circumstances were such as to show negligence on the part of the purchaser, or a want of due inquiry. But this question of negligence seems now to be at an end, and nothing less than fraud defeats the title of the purchaser.

The written transfer of negotiable paper is called an indorsement, because it is almost always written on the back of the note; but it has its full legal effect if written on the face. Joint payees of a bill or note, who are not partners, must all indorse. An indorser may always prevent his own responsibility by writing "without recourse," or other equivalent words, over his indorsement; and any bargain between the indorser and indorsee, written or oral, that the indorser shall not be sued, is available against that indorsee, but not against subsequent indorsees, without notice. A bill or note may be indorsed conditionally, and an acceptor of a bill so indorsed, who paid it before such condition is satisfied or complied with, has been held to pay it again after the condition is performed.

Every indorsement and acceptance admits conclusively the signature of every party who has put his name upon the bill previously in fact, and is also previous in order. Thus an acceptance admits the signature of the drawer, but not the signature of one who actually indorses before acceptance, because acceptance is in its nature prior to indorsement. If a holder strike out an indorsement by mistake, he may restore it; if on purpose, the indorser is permanently discharged. If the plaintiff, in his declaration, derives his title through all the previous indorsements, all must be there, and proved. But a holder may bring his action against any prior indorser, and fill any blank indorsement, specially to himself, and sue accordingly; but then he invalidates subsequent indorsements. The reason is, that he takes from them all right to indorse; thus, for example, if A makes a note to B, and B, C, D, E, and F, indorse it in blank, and G, the holder, writes over C's name, "pay to G," it is as if C had written this himself, and then G only, could indorse, and, of course, D, E, and F could not, as they were mere strangers. And a holder precludes himself from taking advantage of the title of any party whose indorsement is thus voided. Nor can he strike out the name of any indorser prior to that one whom he makes defendant; for, by so doing, he deprives the defendant of his right to look to the party whose name is stricken out, and this discharges the defendant.

One may make a note or bill payable to his own order, and indorse it in blank; and this is now very

common in our commercial cities, because the holder of such a bill or note can transfer it by delivery, and it needs not his indorsement to make it negotiable further.

A transfer by delivery, without indorsement, of a bill or note payable to bearer, or indorsed in blank, does not generally make the transferor responsible to the transferee, for the payment of the instrument. Nor has the transferee a right to fall back, in case of non-payment, upon the transferor, for the original consideration of the transfer, if the bill were transferred in good faith, in exchange for money or goods; for such transfer would be held to be a sale of the bill or note, and the purchaser takes it with all risks. But it seems not to be so where such a note is delivered either in payment or by way of security for a previously existing debt. Then if the transferor has lost nothing by the reception of the note by the transferee—because if he had continued to hold the note, he would have lost it—there seems to be no reason why the transferee should lose it. We have no doubt that such a transferor may make himself liable, without indorsement, by express contract; and that circumstances might warrant and require the implication that the bill or note so transferred remained, by the agreement and understanding of both parties, at the risk of the transferor. And every such transferor warrants that the bill or note (or bank-note) is not forged or fictitious.

An indorsement may be made on the paper before the bill or note is drawn; and such indorsement, says Lord Mansfield, "is a letter of credit for an indefinite sum, and it will not lie in the indorser's mouth to say that the indorsements were not regular." The same rule applies to an acceptance on blank paper. So, an indorsement may be made after or before acceptance. If made after a refusal of acceptance, which is known to the indorsee, he takes only the title of the indorser, and is subject to all defenses available against him. A bill or note once paid at or after maturity ceases to be negotiable, in reference to all who could be prejudiced by its transfer. So, where a bill drawn payable to a third person, by whom it is indorsed, is dishonored and taken up by the drawer, it ceases to be a negotiable instrument; for the drawer has no title to indorse it. But if one draw a bill payable *to his own order*, and indorse it over, and, upon the bill being dishonored, take it up, he may indorse it again, and this last indorsee can recover against the acceptor. And if a bill or note is paid before it is due, it is valid in the hands of a subsequent *bonâ fide* indorsee.

A portion of a negotiable bill or note can not be transferred so as to give the transferee a right of action for that portion in his own name. But if the bill or note be partly paid, it may be indorsed over for the balance. If an action be brought on a bill or note, no transfer during the pendency of such action gives to the transferee a right of action, unless he was ignorant of the action; then the transfer is valid. After a holder's death his personal representative should transfer. But it seems that if a note needing indorsement was indorsed by the holder, but not delivered, the executor can not complete the transfer by delivery. The husband who acquires a right to a bill or note given to the wife, either before or after marriage, may indorse. One who may claim payment of a bill or note, and of whom payment may also be demanded, or one who is liable to contribute for the payment of a note, can not sue upon it. But if only the technical rule—that the same party can not be plaintiff and defendant—prevents the action, it may be avoided by indorsement over to another before maturity.—PARSONS' *Elements of Mercantile Law*, ch. ix. Indus. This great river of Asia has its rise in Thibet, at the north of the Kailas mountain, regarded in Hindoo mythology as the mansion of the gods, in about lat. 32°, long. 81° 30'. It first takes a north-westerly direction for about 460 miles, when it is joined by the river of Dras, which, rising in the mountains of Cashmere, and receiving several streams both from the east and west, discharges a considerable volume of water at its confluence. At Makpon-i-Shagaron, in lat. 35° 48', long. 74° 30', the Indus emerges from the mountainous region, and turning south (a course which it thenceforth continues to the sea), takes its way through the country north of Attock. Close above this last-mentioned town, and at the distance of 870 miles from its source, the Indus receives on the western side the great river of Cabool. Both rivers have a large volume of water, and as they meet amid numerous rocks, the confluence is turbulent, and attended with great uproar. The town of Attock is situated about 1000 feet above the sea-level, and about 17,000 feet below the source of the Indus, which falls, therefore, 16,000 feet in 870 miles, or at the average rate of about 19 feet per mile. The length of its channel from Attock to the sea is 942 miles, and, consequently, in that lower part of its course, it falls little more than 1 foot per mile. For about 10 miles below Attock, the river, though in general rolling between high cliffs of slate rock, has a calm, deep and rapid current; but for 100 miles further down to Kalabagh, it becomes an enormous torrent. Lieutenant Wood, describing this section of its course, observes, "It here rushes down a valley, varying from 100 to 400 yards wide, between precipitous banks from 70 to 700 feet high." From Kalabagh southward, to Mittunkote, distant about 350 miles, the banks, either right or left, are in several places so low, that the first rise of the river covers the country round with water, extending, as the inundation advances, as far as the eye can reach. On entering the plain, the water loses its clearness, and becomes loaded with mud. Two or three miles below Mittunkote, and about 490 miles from the sea, the Indus receives the waters of the Punjnad, the channel which conveys the collected stream of the Punjaub. Above the confluence, the breadth of the Indus is less than that of the other river, but in consequence of the greater depth and velocity, the former has the greater volume of water. Wood found that the Indus, near the confluence, had a breadth of 608 yards, a velocity of about five miles an hour, a depth of 12 or 15 feet, and discharged 91,719 cubic feet per second. The Punjnad had a breadth of 1766 yards, a velocity of about two miles an hour, a depth of 12 or 15 feet, and discharged 68,955 cubic feet per second. Below the junction, the Indus in its lowest state is 2000 yards wide. Its aspect in this part is well described by Major Boileau. He says, "At the place where we crossed the Indus, almost immediately below its junction with the Punjnad, its stream is 2047 yards, or nearly a mile and a quarter in breadth, at a place where its width is unbroken, either by islands or sandbanks. The banks are very low, and the water very muddy, having just begun to rise from the melting snow at its sources, nor is the stream of very great depth, except in the main channel; but with all these drawbacks, it is a magnificent sheet of water, a very prince of rivers." Below Mittunkote, the river passes in succession the towns of Sukkur, Bukkur, Sehwan, Hyderabad, and Trical. The last mentioned of these towns is situate in lat. 25° 9', long. 68° 21', and here the delta commences; and the country below it, and contained between the Fulaile branch on the east, and the extreme western branch of the river, being, with little exception, alluvial, and obviously deposited by the stream. At about five miles below Tatta, and 60 miles from the sea, the Indus divaricates into two great branches, the Buggaur, which flows westward, and the Sata, which maintains the previous course of

the Indus southward, and is, in strictness, the continuation of that river. The lower part of the delta is intersected by rivers and creeks in almost every direction, like the delta of the Ganges; but it so far differs from the latter, that it has no trees on its surface, the dry parts being covered with brushwood, and the remainder, by much the largest part, being noisome swamps or muddy lakes. It is remarkable that the influence of the tides is not felt at a greater distance than 60 or 65 miles from the sea. At the mouths of the different branches, the rush or influx of the tide is high and dangerous, running, as has been estimated, at the rate of four miles an hour, though varying greatly at different places. From the sea up to Hyderabad, the Indus is in general about a mile in breadth, varying in depth from two to five fathoms. The river begins to swell in the middle of July, from the melting of the snow, and continues to increase until the end of August. The most eastern of the estuaries connected with the Indus is the Korea Mouth, from which, proceeding westward, the remaining creeks or estuaries most worthy of notice, occur in the following order: The Seer, Mull, Kaha, Kooke-warree, Kedywarree (discharging the waters of the Sata), Hujamree, Jooa, Durbar, Pitteeanee, Coondee, Pitty, and Gizee. The spring-tide rises nine feet. The length of the navigable part of the river from the sea to Attock, has been ascertained by measurement to be 942 miles, that of the upper part is about 870 miles, making a total length in round numbers of 1800 miles. The average declivity of the water-course from the locality of the source to Attock is, per mile, 19 feet; from Attock downward to Kalabagh, a distance of about 110 miles, it is 20 inches; from this place to Mittunkote, a distance of about 350 miles, it is eight inches, and thence to the sea six inches. The Indus appears destined to become an important channel of commercial communication.—E. T.

Ingot, a mass of gold or silver melted down and cast in a mold, but not coined or wrought. A large portion of the gold received from California at New York is put into this shape for more convenient export.

Ink (Du. *Ink*, *Inkt*; Fr. *Encre*; Ger. *Dinte*; It. *Inchiostro*; Lat. *Atramentum*; Rus. *Tschernilo*; Sp. *Tinta*; Sw. *Blak*). Every liquor or pigment used for writing or printing is distinguished by the name of ink. Common practice knows only black and red. Of black there are three principal kinds: 1. Indian ink; 2. Printers' ink; and 3. Writing ink. The Indian ink is used in China for writing with a brush, and for painting upon the soft flexible paper of Chinese manufacture. It is ascertained, as well from experiment as from information, that the cakes of this ink are made of lampblack and size, or animal glue, with the addition of perfumes or other substances not essential to its quality as an ink. The fine soot from the flame of a lamp or candle received by holding a plate over it, mixed with clean size from the shreds of parchment or glove-leather not dyed, will make an ink equal to that imported. Good printers' ink is a black paint, smooth, and uniform in its composition, of a firm black color, and possesses a singular aptitude to adhere to paper thoroughly impregnated with moisture.

The ancient black inks were composed of soot and ivory black, and Vitruvius and Pliny mention lampblack; but they had likewise various colors, as red, gold, silver, and purple. Red ink was made by them of vermilion and various kinds of gum. Indian ink is brought from China, and must have been in use by the people of the East from the earliest ages, most of the artificial Chinese productions being of very great antiquity. It is usually brought to Europe in small quadrangular cakes, and is composed of a fine black animal glue.—BECKMANN.

Black Ink.—Nutmalls, sulphate of iron, and gum,

are the only substances truly useful in the preparation of ordinary ink; the other things often added merely modify the shade, and considerably diminish the cost to the manufacturer upon the great scale. Many of these inks contain little gallic acid, or tannin, and are therefore of inferior quality. To make 12 gallons of ink, we may take 12 lbs. of nutgalls, 5 lbs. of green sulphate of iron, 5 lbs. of gum senegal, and 12 gallons of water.

The bruised nutgalls are to be put into a cylindrical copper, of a depth equal to its diameter, and boiled, during three hours, with three fourths of the above quantity of water, taking care to add fresh water to replace what is lost by evaporation. The decoction is to be emptied into a tub, allowed to settle, and the clear liquor being drawn off, the lees are to be drained. Some recommend the addition of a little bullock's blood or white of egg, to remove a part of the tannin. But this abstraction tends to lessen the product, and will seldom be practiced by the manufacturer intent upon a large return for his capital. The gum is to be dissolved in a small quantity of hot water, and the mucilage thus formed, being filtered, is added to the clear decoction. The sulphate of iron must likewise be separately dissolved, and well mixed with the above. The color darkens by degrees, in consequence of the peroxydization of the iron on exposing the ink to the action of the air. But ink affords a more durable writing when used in the pale state, because its particles are then finer, and penetrate the paper more intimately. When ink consists chiefly of tannate of peroxyd of iron, however black, it is merely superficial, and is easily erased or effaced. Therefore, whenever the liquid made by the above prescription has acquired a moderately deep tint, it should be drawn off clear into bottles, and well corked up. Some ink-makers allow it to mold a little in the casks before bottling, and suppose that it will thereby be not so liable to become moldy in the bottles. A few bruised cloves, or other aromatic perfume, added to ink, is said to prevent the formation of moldiness, which is produced by the ova of infusoria animalcules. I prefer digesting the galls to boiling them.

The operation may be abridged, by peroxydizing the coppers beforehand, by moderate calcination in an open vessel; but, for the reasons above assigned, ink made with such a sulphate of iron, however agreeable to the ignorant, when made to shine with gum and sugar, under the name of japan ink, is neither the most durable nor the most pleasant to write with. From the comparatively high price of gall-nuts, sumach, logwood, and even oak bark, are too frequently substituted, to a considerable degree, in the manufacture of ink. The ink made by the prescription given above, is much more rich and powerful than many of the inks commonly sold. To bring it to their standard, a half more water may safely be added, or even 20 gallons of tolerable ink may be made from that weight of materials. Sumach and logwood admit of only about one half of the coppers that galls will take to bring out the maximum amount of black dye. Chaptal gives a prescription in his *Chimie appliquée aux arts*, which, like many other things in that book, are published with very little knowledge and discrimination. He uses logwood and sulphate of copper, in addition to the galls and sulphate of iron; a pernicious combination, productive of a spurious fugitive black, and a liquor corrosive of pens. It is, in fact, a modification of the vile dye of the hatters. Lewis, who made exact experiments on inks, assigned the proportion of 8 parts of galls to 1 of sulphate of iron, which, with average galls, will answer very well; but good galls will admit of more coppers.

Gold Ink is made by grinding upon a porphyry slab, with a muller, gold leaves along with white honey, till they be reduced to the finest possible division. The paste is then collected upon the edge of a knife or

spatula, put into a large glass, and diffused through water. The gold by gravity soon falls to the bottom, while the honey dissolves in the water, which must be decanted off. The sediment is to be repeatedly washed till entirely freed from the honey. The powder, when dried, is very brilliant, and when to be used as an ink, may be mixed up with a little gum water. After the writing becomes dry, it should be burnished with a wolf's tooth.

Silver Ink is prepared in the same manner.

Indelible Ink.—A very good ink, capable of resisting chlorine, oxalic acid, and ablation with a hair pencil or sponge, may be made by mixing some of the ink made by the preceding prescription, with a little genuine China ink. It writes well. Many other formulæ have been given for indelible inks, but they are all inferior in simplicity and usefulness to the one now prescribed. Solution of nitrate of silver thickened with gum, and written with upon linen or cotton cloth, previously imbued with a solution of soda, and dried, is the ordinary permanent ink of the shops. Before the cloths are washed, the writing should be exposed to the sunbeams, or to bright daylight, which blackens and fixes the oxyd of silver. It is easily discharged by chlorine and ammonia. A good permanent ink may be made by mixing a strong solution of chlorid of platinum with a little potash sugar, and gum to thicken. The writing made therewith should be passed over with a hot smoothing iron to fix it.

By decomposing vanadate of ammonia with infusion of galls, a liquid is obtained of a perfectly black hue, which flows freely from the pen, is rendered blue by acids, is insoluble in dilute alkalis, and resists the action of chlorine. Whenever the metal vanadium shall become more abundant, as it probably may ere long, we shall possess the means of making an ink, at a moderate price, much superior to the tannate and gallate of iron. To prepare the above vanadic salt cheaply, the cinder or hammerschlag obtained from the iron made at Ekersholm, in Sweden, or other iron which contains vanadium, being reduced to a fine powder, is to be mixed with two thirds of its weight of nitre, and one third of effloresced soda. The mixture is to be ignited in a crucible; cooled and lixiviated, whereby solutions of the vanadates of potash and soda are obtained, not pure, indeed, but sufficiently so for being decomposed, by means of sal ammoniac, into a vanadate of ammonia. This being rendered nearly neutral with any acid, constitutes an excellent indelible ink.

Indelible Ink may be prepared by adding lampblack and indigo to a solution of the gluten of wheat in acetic acid. This ink is of a beautiful black color, at the same time cheap, and can not be removed by water, chloria, or dilute acids. M. Herberger gives the following directions for its preparation: Wheat-gluten is carefully freed from the starch, and then dissolved in a little weak acetic acid; the liquid is now mixed with so much rain water that the solution has about the strength of wine vinegar, i. e., neutralizes 1.16 of its weight of carbonate of soda. 10 grs. of the best lampblack and 2 grs. of indigo are mixed with 4 ozs. of the solution of gluten, and a little oil of cloves added. This ink may be employed for marking linen, as it does not resist mechanical force.

Ink, indelible, of Dr. Traill, is essentially the same as the above. French indelible ink consists of Indian ink diffused through dilute muriatic acid, for writing with quills, and through weak potash lye for writing with steel pens.

Red Ink.—This ink may be made by infusing, for three or four days in weak vinegar, Brazil wood chipped into small pieces; the infusion may be then boiled upon the wood for an hour, strained, and thickened slightly with gum arabic and sugar. A little alum improves the color. A decoction of cochineal with a little water of ammonia, forms a more beautiful red

ink, but it is fugitive. An extemporaneous red ink of the same kind may be made by dissolving carmine in weak water of ammonia, and adding a little mucilage.

Green Ink.—According to Klaproth, a fine ink of this color may be prepared by boiling a mixture of two parts of verdigris in eight parts of water, with one of cream of tartar, till the total bulk be reduced one half. The solution must be then passed through a cloth, cooled, and bottled for use.

Yellow Ink is made by dissolving 3 parts of alum in 100 of water, adding 25 parts of Persian or Avignon berries bruised, boiling the mixture for an hour, straining the liquor, and dissolving it in 4 parts of gum arabic. A solution of gamboge in water forms a convenient yellow ink.

By examining the different dye-stuffs, and considering the processes used in dyeing with them, a variety of colored inks may be made.

China Ink.—Proust says, that lampblack purified by potash ley, when mixed with a solution of glue, and dried, formed an ink which was preferred by artists to that of China. M. Merimée, in his interesting treatise, entitled *De la peinture à l'huile*, says, that the Chinese do not use glue in the fabrication of their ink, but that they add vegetable juices, which render it more brilliant and more indelible upon paper. When the best lampblack is levigated with the purest gelatine or solution of glue, it forms, no doubt, an ink of a good color, but wants the shining fracture, and is not so permanent on paper as good China ink; and it stiffens in cold weather into a tremulous jelly. Glue may be deprived of the gelatinizing property by boiling it for a long time, or subjecting it to a high heat in a Papin's digester; but as ammonia is apt to be generated in this way, M. Merimée recommends starch gum made by sulphuric acid (British gum) to be used in preference to glue. He gives, however, the following directions for preparing this ink with glue. Into a solution of glue he pours a concentrated solution of gall-nuts, which occasions an elastic resinous-looking precipitate. He washes this matter with hot water, and dissolves it in a spare solution of clarified glue. He filters anew, and concentrates it to the proper degree for being incorporated with the purified lampblack. The astringent principle in vegetables does not precipitate gelatin when its acid is saturated, as is done by boiling the nut-galls with lime-water or magnesia. The first mode of making the ink is to be preferred. The lampblack is said to be made in China, by collecting the smoke of the oil of sesame. A little camphor (about 2 per cent.) has been detected in the ink of China, and is supposed to improve it. Infusion of galls renders the ink permanent on paper.

Sympathetic Ink.—The best is a solution of muriate of cobalt.

Printers' Ink. See URE's *Dict.* for full details.

Blue Ink.—Mr. Stephens's patent blue ink is made by dissolving Prussian blue in a solution of oxalic acid. The blue should be washed in dilute muriatic acid. M. Hornung has given the following as the best formula for blue ink: Mix 4 parts of perchlorid of iron, in solution, with 7.50 parts of water, then add 4 parts of cyanid of potassium dissolved in a little water; collect the precipitate formed; wash it with several additions of water; allow it to drain until it weighs about 200 parts; add to this 1 part of oxalic acid, and promote the solution of the cyanid by shaking the bottle containing the mixture. The addition of gum and sugar is useless, and even appears to exercise a prejudicial effect on the beauty of the ink. It may be kept without any addition for a long time.—URE's *Dictionary of Manufactures*. See INDIAN INK.

Inkle, a sort of broad linen tape, principally manufactured at Manchester and some other towns in Lancashire.

Inlaid work. There are many pretty and varied kinds of inlaid work manufactured from small fragments of material. There is the *Marquetrie* or inlaid cabinet-furniture of France, consisting in inlaying woods of a great variety of tints, in the form of flowers, ornaments, etc. The *Buhl*, or Boul-work, is also of French invention, wherein metals are inlaid upon a ground of ebony or tortoise-shell. The elaborate German cabinets, made of ebony, are inlaid with precious stones and various woods and metals. There is the *Mosaic inlay*, in which the pieces inlaid are extremely small, and of which exquisite boxes are made by the Hindoos; witness, too, the marvelous Spanish table at the Great Exhibition of London in 3,000,000 of pieces. The *Parquetrie*, or inlaid flowering, which differs from Marquetrie chiefly in the bolder scale of the designs; woods of different colors being cut to pattern, and inlaid. There is the novel and beautiful process of inlaying articles of furniture with porcelain; the inlaid portions are not merely pannels and pilasters, but painted porcelain flowers and other ornaments. The *Pietra Dura* is a kind of art carried to great perfection in Tuscany: its cultivation in that country has for a long period supplied most of the palaces of Europe with works in *pietra dura*, which rank among the finest examples of decorative furniture.

Insolvency and Bankruptcy. The first Insolvent Act in England was passed in 1649, but it was of limited operation; a number of acts of more extensive operation were passed at various periods, and particularly in the reign of George III. The benefit of the act known as the Great Insolvent Act was taken in England by 50,733 insolvents from the time of its passing, in 1814, to March, 1827, a period of 13 years. Since then, the acts relating to insolvency have been several times amended. Persons not traders, or, being traders, whose debts are less than £300, may petition the Court of Bankruptcy, and propose composition, and have *pro tem.* protection from all process against their persons and property, 6 Vict., 1842. Act amended, 8 Vict., August, 1844.—HAYDN.

Bankruptcy.—Blackstone defines a bankrupt—"A trader who secretes himself, or does certain other acts tending to defraud his creditors." But an intention to defraud is not now held to be essential to constitute a bankrupt; who may be either simply an insolvent, or a person who is guilty of certain acts tending to defraud his creditors.

INSOLVENCY.—*Analysis of the Laws of Bankruptcy.*—In Great Britain, insolvency is applied to every class of persons, while bankruptcy is exclusively applied to traders. In foreign countries, insolvency is the general denomination. Bankruptcy is declared when there is any degree of criminality. The law of bankruptcy of England is consolidated in the 12 and 13 Vict., c. 106. In America, various attempts were made for a general enactment for all the States, but with no success. The act of Congress on the subject, passed in 1841, was repealed in 1843. Special insolvency laws exist, of which an abstract is given hereafter. In Scotland, the bankrupt law is included in the 2 and 8 Vict., chap. 41. The French law of the 28th of May, 1838, has modified the Code of Commerce of 1807. Article 437 permits declaration of the insolvency of a trader after his decease. The law of Scotland authorizes the sequestration of estates of a deceased debtor. The same is permitted in Portugal. In England a Court of Bankruptcy is instituted, which may adjudge the creditor a bankrupt. In Scotland the same is placed with the Lord Ordinary. In France the same authority is given to the tribunal. Acts of bankruptcy may be committed in England in various ways. All acts made previous to adjudication of bankruptcy are valid, if they are entered into *bonâ fide* on the part of the contracting party. In France, the following acts, made within 10 days preceding the opening of the insolvency, are void: 1st. Acts transferring property

gratuitously; 2d. Payment of debts not due, and of those due settled otherwise than with commercial effects; 3d. All mortgages, antichrese, or security, consented to for anterior debts; and, lastly, all acts whatever made by the debtor with a third party who was cognizant of his having stopped payment. Articles 53 to 54 of the Prussian code contain also similar instructions. The Spanish code fixes 80 days; the Portuguese code, 40 days; the Dutch code, two months previous to the insolvency as the time during which the insolvent could not alienate his property gratuitously, or endow his children, or transfer or mortgage his real estate.

The Dutch code declares void the donations made by the insolvent at any time where he knew his affairs embarrassed, although the donee was *bonâ fide*. The Russian code prohibits the wife and children of the insolvent to reclaim the donations made to them. By Article 1451, the property engaged by the insolvent, and not yet sold, may be redeemed, and form portions of the assets. As to the administration of the insolvency in England, assignees are chosen by the creditors, under the supervision of the Court. In Scotland, creditors are to elect an interim factor and a trustee, and also three commissioners. In France, the agents created by the code 1807 have been suppressed, and at present there are no more than provisional assignees, who continue their functions till the confirmation of the settlement, or till the formation of the contract of union. The Tribunal of Commerce of Paris has formed a fixed number of assignees, to whom is confided the management of all bankruptcies.

In Spain, the tribunal designates a commissioner, nominates a trustee for the property of the insolvent, and calls the creditors, who choose some assignees, who are to be taken from among the creditors, or their attorneys. In England, the commissioners of bankruptcy are judges, elected by the Lord Chancellor, one for each district. All legislation provides for the remuneration of the assignees, trustees, or administrators: these remunerations are fixed by Art. 1078, Spanish code, Portuguese code, Russian code, etc., etc., either upon a determined share, or the receipts which they have realized, or by remuneration, valued by the tribunal. The Spanish code prohibits an attorney from representing more than one creditor; and the Portuguese code prohibits a creditor from representing another creditor at the meetings.

In order that an insolvent may obtain a settlement, there need be, in France and in Russia, a majority of the creditors and three fourths of the debts. In Scotland, a majority and three fifths of the debts. In Spain, one more than the half of creditors and three fifths of the debts. The wife of the insolvent has no deliberative voice there in the resolutions relative to the settlement. In Holland, in Portugal, in Wurtemberg, and according to the ordinance of Bilbao, the two thirds of ordinary creditors and three fourths of debts, or the three fourths of the creditors and two thirds of the debts must be added together. The Prussian code, which divides the creditors into six classes, exacts the majority on sum and classes; in case of division of classes, the settlement may be adopted by the one and rejected by another; but if the division is impracticable, the declaration of division shall be equivalent then to a refusal. With respect to the confirmation, both in France and in Spain, it can only be pronounced eight days after the settlement has been obtained. The dissenting creditors, according to the Spanish code, can not form opposition to it, unless on account of defects in the forms of calling the meetings, on account of collusion, or of want of legitimate rights in the parties voting, or of fraudulent exaggeration of their debts; and in Holland, when the assets exceed the sum entered in the settlement. The Dutch code and the French law render the confirmation obligatory upon all the creditors both absent and

present, and even upon those who have not been called.

The rights of foreign creditors are generally regulated by treaties, Prussia, or by the right of reciprocity, Austria. By the French code of civil procedure, two months are granted to creditors residing in England to prove their debts. By the Sardinian code, such delay is three months.—*Com. Law of the World*, by LEONE LEVI. London, 1856. 2 vols.

United States.—There is not any bankrupt system in existence under the government of the United States. An act of Congress was passed on the subject in 1841, but it was repealed in 1843. The several States are left free to institute their own bankrupt system. Insolvent laws prevail throughout the Union. In the States of Maine, New Hampshire, Massachusetts, Virginia, and Kentucky, they are confined to the relief of debtors charged in execution. In New Jersey, Delaware, Maryland, Tennessee, North and South Carolina, Georgia, Alabama, Mississippi, and Illinois, the insolvent laws extend to debtors in prison on mesne or final process. In New York, Connecticut, Rhode Island, Pennsylvania, Ohio, Indiana, Missouri, and Louisiana, they are still more extensive, and reach the debtor whether in or out of prison. The following is an abstract of the laws of the several States in reference to summary attachment against insolvents:

I. *Alabama*.—Original attachments, foreign and domestic, are issued by judges of the circuit or county courts, or justices of the peace. An attachment may issue, although the debt or demand of the plaintiff be not due; and shall be a lien on the property attached, until the debt or demand becomes due, when judgment shall be rendered and execution issued. A non-resident plaintiff may have an attachment against the property of a non-resident defendant; provided he gives good and sufficient resident security in the required bond; making oath that the defendant has not sufficient property within the State of defendant's residence to satisfy the debt or demand.

II. *Arkansas*.—An attachment may be issued against the property of a non-resident; and also against a resident of the State when the latter is about to remove out of the State; or is about to remove his goods or effects; or about to secrete himself so that the ordinary process of law can not be served on him.

III. *California*.—1. Creditors may proceed by attachment when the defendant has absconded, or is about to abscond from the State; or is concealed therein to the injury of his creditors. 2. When the defendant has removed, or is about to remove, any of his property out of the State, with intent to defraud his creditors. 3. When the defendant fraudulently contracted the debt, or incurred the obligation, respecting which the suit is brought. 4. When the defendant is a non-resident. 5. When he has fraudulently conveyed, disposed of, or concealed his property, or a part of it; or intends to convey the same to defraud his creditors. In California the real estate shall be bound, and the attachment shall be a lien thereon, although the debt or demand due the plaintiff be not due—in case the defendant is about to remove himself or his property from the State. The law of attachment applies in California, when the contract has been made in that State, or when made payable in that State.

IV. *Connecticut*.—Attachment may be granted against the goods and chattels and land of the defendant; and likewise against his person when not exempted from imprisonment on the execution in the suit. The plaintiff to give bonds to prosecute his claim to effect.

V. *Delaware*.—A writ of domestic attachment issues against an inhabitant of Delaware when the defendant can not be found; or has absconded with intent to defraud his creditors; and a writ of foreign attachment when the defendant is not an inhabitant of this State.

This attachment is dissolved by the defendant's appearing and putting in special bail at any time before judgment.

VI. *Florida*.—An attachment issues when the amount is actually due, and the defendant is actually removing out of the State, or absconds or conceals himself.

VII. *Georgia*.—A judge of the superior court, or a justice of the inferior court, or a justice of the peace, may grant an attachment against a debtor whether the debt be matured or not, when the latter is removing without the limits of the State, or any county, or conceals himself. The remedy by attachment may be resorted to by non-resident as well as by resident creditors. The necessary affidavit may be made before any commissioner appointed by the State to take affidavits. Indorsers of notes, obligations, and all other instruments in writing, are entitled to the same remedy as provided for securities. In all cases the attachment first served shall be first satisfied. No lien shall be created by the levying of an attachment, to the exclusion of any judgment obtained by any creditor, before judgment is obtained by the attaching creditor.

VIII. *Illinois*.—Attachments are issued by the clerks of the circuit court, when affidavit is filed that the defendant has departed, or is about to depart, out of the State, or conceals himself, so that process can not be served upon him.

IX. *Indiana*.—The property of an inhabitant of the State may be attached, whenever he is secretly leaving the State, or shall have left the State with intent to defraud his creditors. The property of a non-resident is liable to attachment as in other States.

X. *Iowa*.—The plaintiff may cause any property of the defendant, which is not subject to execution, to be attached at the commencement, or during the progress, of the proceedings, whether the claim be matured or not; provided an affidavit is filed to the effect that the defendant is a foreign corporation, or acting as such, or that he is a non-resident of the State, or (if a resident) that he is in some manner about to dispose of or remove his property out of the State.

XI. *Kentucky*.—1. The plaintiff may have an attachment against the property of the defendant when the latter is a foreign corporation, or a non-resident of this State; or, 2. who has been absent therefrom four months; or, 3, has departed from the State with intent to defraud his creditors; or, 4, has left the county of his residence to avoid the service of a summons, or conceals himself that a summons can not reach him; or, 5, is about to remove his property, or a material part thereof, out of the State; or, 6, has sold or conveyed his property with the intent to defraud his creditors, or is about so to sell or convey. Such attachment is binding upon the defendant's property in the county from the time of the delivery of the order to the sheriff.

XII. *Louisiana*.—A creditor may obtain an attachment against the property of his debtor upon affidavit: 1, when the latter is about leaving permanently the State before obtaining or executing judgment against him; 2, when the debtor resides out of the State; 3, when he conceals himself to avoid being cited to answer to a suit, and provided the term of payment have arrived. In the absence of the creditor, the oath may be made by his agent or attorney, to best of his knowledge and belief.

XIII. *Maine*.—In this State, an original writ may be framed either to attach the goods or estate of the defendant, or for want thereof to take his body. All goods and chattels may be attached by the creditor and held as security pending any suit against the debtor. Such a writ will authorize an attachment of goods and estate of the principal defendant, in his own hands, as well as in the hands of trustees. Real estate, liable to be taken in execution, may be attached.

XIV. Maryland.—A creditor may obtain an attachment, whether he be a citizen of Maryland or not, against his debtor, who is not a citizen of this State, and not residing therein. If any citizen of the State, being indebted to another citizen thereof, shall actually run away or abscond, or secretly remove himself from his place of abode, with intent to evade the payment of his just debts, an attachment may be obtained against him. An attachment may be laid upon debts due the defendant upon judgments or decrees rendered or passed by any court of this State, and judgment of condemnation thereof may be had, as upon other debts due the defendant.

XV. Massachusetts.—Original writs may be framed, either to attach the goods or estate of the defendant, or for want thereof to take his body; or, there may be an original summons, either with or without an order to attach the goods or estate. All real estate, or goods and chattels that are liable to be taken in execution, may be attached upon the original writ, in any action in which any debt or damages are recoverable, and may be held as security to satisfy such judgment as the plaintiff may recover.

XVI. Michigan.—The grounds of attachment in this State are, 1, that the defendant has absconded, or is about to abscond, or has concealed himself; 2, that he has assigned, or concealed, or is about to remove, his property with a view to defraud; 3, that he fraudulently contracted the debt, or incurred the obligation, about which the suit is brought; 4, that he is not a resident of the State, or has not resided there three months immediately preceding the suit; 5, that the defendant is a foreign corporation.

XVII. Mississippi.—An attachment against the estate, including real estate, slaves, goods, chattels, etc., of a debtor, when it is shown that he has removed, or is about removing or absconding from the State, or privately conceals himself. Attachment also lies against the property of non-resident decedents. It may be obtained before the debt is due for which it issues, when the creditor has ground to believe that the debtor will remove with his effects out of the State, or has removed.

XVIII. Missouri.—An attachment may be issued here when the debtor is not a resident of the State; or, if a resident, when he absconds, absents, or conceals himself; or is about to remove his property, or fraudulently convey it, with a view to hinder or delay his creditors; or, 2, where the debt was contracted out of the State, and the debtor has secretly removed his effects into this State with intent to defraud.

XIX. New Hampshire.—In this State a writ of attachment may be issued upon the institution of any personal action; and will hold real and personal property, shares of stock in corporations, pews in churches, and the franchise of any corporation authorized to receive tolls; until the period of thirty days from the time of rendering the judgment.

XX. New Jersey.—An attachment may issue at the instance of a creditor (or in his absence, of his agent or attorney), against the property of a debtor when the latter is about to abscond from the State, or is not a resident of the State, or is a foreign corporation.

XXI. New York.—Any creditor to the amount of \$25 may compel the assignment of their estates by debtors imprisoned on execution in civil causes for more than 60 years. If the debtor refuses to be examined, and to disclose his affairs, he is liable to be committed to close confinement. If he refuses to render an account inventory, and make an assignment, he will not be entitled to his discharge; though the officer having jurisdiction in the case is authorized to make the assignment for him. The proceedings, and the effect of the discharge, when duly obtained, and the duties of the debtor, and the rights of the creditors, are essentially the same as in the case of proceedings with the assent of two thirds of the creditors.

2. Every insolvent debtor may also petition the proper officers for leave voluntarily to assign his estate for the benefit of his creditors; and the same proceedings and checks are substantially prescribed as in other cases of insolvency. His discharge, obtained in such a case, exempts him from imprisonment, as to debts due at the time of the assignment, or previously contracted; and as to liabilities incurred by making or indorsing any promissory note or bill of exchange. But the discharge does not affect or impair any debt, demand, payment, or decree against the insolvent; and they remain good against his property acquired after the execution of the assignment; and the lien of judgment and decree is not affected by the discharge.

3. The creditor at whose suit the debtor is imprisoned, may require him, after the expiration of three months, to make the assignment, and his refusal will forever bar him from his discharge under this provision.

4. Corporations being creditors, may petition by a director, or other officer, acting under the corporate seal; and such director or officer, may make the requisite affidavits. So one joint partner may act as a creditor for the firm; and provision is made for the accommodation of non-resident creditors.

5. Debts purchased below the nominal amount entitle the creditor to act to the amount of the sum actually and bona fide paid; nor is a creditor having a security permitted to become a petitioner unless he relinquishes his security for the common benefit of the creditors. The assignments and discharges in these insolvent cases are to be recorded by the clerk of the county in which they were executed. No debt or duty to the United States is affected by any such discharge, not even as to the remedy by imprisonment; but debts and duties to the State, except taxes, are placed upon the same footing as debts to individuals.

6. The assignment of the insolvent passes all his interest, legal and equitable, existing at the time of executing the assignment in any estate, real or personal; but no contingent interest passes unless it shall become vested within three years after making the assignment, and then it passes. Probabilities coupled with an interest are assignable; but not bare possibilities, such as the expectancy of an heir. The assignment does not affect property held by the debtor in trust; nor does the assignment by the insolvent husband affect the property settled to the separate use of the wife free and clear of her husband.

7. The insolvent discharges apply only to debts existing when the petition, inventory, and schedule of debts are presented, and not so as to cover debts contracted between that time and the time of the discharge.

8. The property assigned is distributed ratably among all the creditors, subject, nevertheless, to existing legal liens and priorities existing before the assignment; and under the New York insolvent laws, a creditor can not become a petitioning creditor in respect to any debt secured by a legal lien, unless he previously relinquishes that lien for the general benefit of the creditors.

9. The attachment-law of New York is a legal mode, by which a title to property may be acquired by operation of law. When the debtor, who is an inhabitant of New York, absconds, or is concealed, a creditor to whom he owes \$100, or any two, to whom he owes \$150, or any three, to whom he owes \$300, may, on application to a judge or commissioner, and on due proof of the debt, and of the departure or concealment, procure his real and personal estate to be attached; and on due public notice of the proceeding, if the debtor does not within three months return and satisfy the creditor, or appear and offer to contest the fact of having absconded, or offer to appear and contest the validity of the demand and give the requisite security, then trustees are to be appointed who become vested with the debtor's estate; and they are to col-

lect and sell it, and settle controversies, and make dividends among all his creditors, in the mode prescribed.

10. From the time of the notice, all sales and assignments by the debtor are declared to be void. If the debtor resides out of the State, and is indebted on a contract made within the State, or to a creditor residing within the State, although upon a contract made elsewhere, his property is liable to be attached and sold in like manner; but the trustees are not to be appointed until nine months after public notice of the proceedings.

11. Perishable goods, other than vessels, when attached under the Absconding Debtor Act, may be immediately sold and converted into money; and if the sheriff, under the attachment, seizes property claimed by third persons, he is to summon a jury and to take their inquiry as to the title to the property claimed.

12. If any American vessel belonging to the debtor be attached under these proceedings, it may be released on the claimant of the vessel giving security to pay the amount of the valuation of the vessel to the trustees, or to the debtor, as the case may be; and if it be a foreign vessel claimed by a third person, the attaching creditor must give security to prosecute the attachment, and to pay the damages if it should appear that the vessel belonged to the claimant.

13. A creditor, having an unliquidated demand resting on contract, is a creditor within the Absconding Debtor Act, and competent to apply for the attachment. Any creditor may proceed against an absconding or concealed debtor, being an inhabitant of the State, or against any non-resident debtor, if the contract was made in New York; but if the contract was made elsewhere, then the creditor must be a resident of the State.

14. Attachment-laws against the property, real and personal, of absconding and non-resident debtors prevail throughout the several United States, but those statute laws are not uniform on this point.

XXII. *North Carolina*.—An attachment may issue on the complaint of a creditor, his agent, attorney or factor, against the property of a debtor when he has removed, or is about to remove, privately from the State, so that the ordinary process of law will not reach him.

XXIII. *Ohio*.—1. A creditor may procure, before or after the maturity of the claim, an attachment against the property of a debtor, where the latter is a foreign corporation or a non-resident; or, if a resident, when he has absconded, or left the county of his residence, or conceals himself; or is about to remove or convert his property, with a view to defraud his creditors. 2. When the debtor fraudulently contracted the debt, or incurred the obligation.

XXIV. *Pennsylvania*.—In this State the writ of domestic attachment issues against any debtor, being an inhabitant of the State, if he has absconded from his usual place of abode; or shall have remained absent from the State, or shall have confined himself in his own house, or concealed himself elsewhere, to defraud his creditors. No second attachment will be issued against the same property, unless the first be not executed, or be dissolved by the court. A writ of attachment may be also issued against the property of a foreign corporation or a non-resident. In the latter case, the attachment inures to the benefit of the attaching creditor only. In the former case, it is for the benefit of creditors at large.

XXV. *Rhode Island*.—In this State a writ of attachment is first levied against the body of the defendant; and if he can not be found, then against his goods and chattels. The property of foreign corporations and debtors is also liable to attachment, at the suit of a creditor.

XXVI. *South Carolina*.—A writ of attachment will issue, at the instance of a creditor wherever residing, against a debtor when he is a non-resident—or

against a citizen who has been absent more than a year and a day; or when he absconds or is removing out of the county; or conceals himself so that the ordinary process of law can not reach him.

XXVII. *Tennessee*.—When a debtor has removed, or is about to remove out of the county privately, or absconds or conceals himself, an attachment may be obtained against his property, at the suit of a creditor, or his agent, attorney, or factor. In the case of non-resident debtors, having any real or personal property in the State, it is required, in order to obtain an attachment, to file a bill in chancery.

XXVIII. *Texas*.—Original attachments are issued against the property of a debtor when he is not to be found in the county; and the property attached shall remain in custody until final judgment. Attachment will also lie when the defendant is a non-resident; or when a resident is about to remove out of the State; and whether the debt be matured or not.

XXIX. *Vermont*.—Writs of attachment may issue against the goods, chattels, or estate of the defendant, or for want thereof, against his body, before or after the maturity of a claim. Actions against non-residents, or when the defendant has absconded from the State, may be commenced by trustee process.

XXX. *Virginia*.—The property of the defendant, if a non-resident, or a resident who is about to remove himself or effects from the State, is liable to attachment. An attachment in such cases will hold before the claim is due and payable.

XXXI. *Wisconsin*.—An attachment will hold against the property of a debtor when he has absconded, or is about to abscond, from the State; or has fraudulently assigned, disposed of, or concealed his effects; or removed his property from the State; or when the defendant is a non-resident or a foreign corporation.

XXXII. *Minnesota*.—A warrant of attachment may be issued against the property of a defendant when a foreign corporation; or, when not a resident of this Territory; or, 3, has left the Territory with intent to defraud his creditors.

Thus it will be seen that in all the States the property of non-residents and foreign corporations is liable to attachments at the suit of creditors, before judgment is rendered; likewise against domestic debtors when they have absconded from the State, or have fraudulently conveyed, or are about to convey, sell, assign, or secrete their effects. In some few States, however, even this condition is not essential before a writ of attachment will issue.

In the States of Alabama, Massachusetts, Connecticut, Maine, New Hampshire, Vermont, and Rhode Island, the creditor may have a writ of attachment against the property of the debtor at the first institution of a suit; and without any ground of fraud or fraudulent intent—such property being held by the attachment until the termination of the suit, or until judgment; the plaintiff in such cases giving bond or security to indemnify the defendant for any loss or damage sustained, should the case be decided in favor of the latter. Generally, the property is liable only when actually levied upon; but in the State of Kentucky only, the property is liable from the moment of the delivery of the order to the sheriff.

The reader will find the American law on this subject fully illustrated in "A Treatise on the Law of Suits by Attachment in the United States. By CHAS. D. DRAKE, of the St. Louis Bar." 8vo. Published by Messrs. Little & Brown, Boston; to which work we are indebted for the present abstract. On the subjects of insolvency and bankrupt laws, see HUNT'S *Mer. Mag.*, v., 360, iv., 22, vi., 419, vii., 261, 352, viii., 294, xxi., 513, xxii., 64, 195, 311; *N. Y. Rev.*, vii., 440; *Am. Reg.*, ii., 74; *Westminster Rev.*, xli., 500, lii., 419; *Dem. Rev.*, xiii., 286; *No. Am. Rev.*, vii., 25; *NILES'S Register*, xix., 403, xxi., 243, 382 (JOHN SERGEANT), 407 (ANDREW STEVENSON).

Insurance, a contract of indemnity, by which one party engages, for a stipulated sum, to insure another against a risk to which he is exposed. The party who takes upon him the risk, is called the *Insurer, Assurer, or Underwriter*; and the party protected by the insurance is called the *Insured, or Assured*; the sum paid is called the *Premium*; and the instrument containing the contract of indemnity is called the *Policy*.

Insurance on Ships and Merchandise.—Suetonius conjectures that Claudius was the first contriver of it, A.D. 48. Insurance was in general use in Italy in 1194, and in England in 1660. Insurance policies were first used in Florence in 1523. The first law relating to insurance was enacted in 1601. Insurance of houses and goods in London began in 1667. This was the year following that of the great fire of London. An office was then set up for insuring houses and buildings, principally contrived by Dr. Barton, one of the first and most extensive builders of the city of London. The first regular office set up in London was the *Hand-in-Hand*, in 1696. A duty was laid on insurances of 1s. 6d. per £100 insured, in 1782: this duty was increased in 1797, and was variously altered since. The date of the first insurance office in the United States has not been ascertained.—HAYDN.

This article has been divided under the general heads of: I. Insurance (General Principles of). II. Insurance (Marine). III. Insurance (Fire). IV. Insurance (Life).

I. **INSURANCE (GENERAL PRINCIPLES OF)**.—It is the duty of government to assist, by every means in its power, the efforts of individuals to protect their property. Losses do not always arise from accidental circumstances, but are frequently occasioned by the crimes and misconduct of individuals; and there are no means so effectual for their prevention, when they arise from this source, as the establishment of a vigilant system of police, and of such an administration of the law as may be calculated to afford those who are injured a ready and cheap method of obtaining every practicable redress; and, as far as possible, of insuring the punishment of culprits. But, in despite of all that may be done by government, and of the utmost vigilance on the part of individuals, property must always be exposed to a variety of casualties from fire, shipwreck and other unforeseen disasters. And hence the importance of inquiring how such unavoidable losses, when they do occur, may be rendered least injurious. The loss of a ship, or the conflagration of a cotton-mill, is a calamity that would press heavily even on the richest individual. But were it distributed among several individuals, each would feel it proportionally less; and provided the number of those among whom it was distributed were very considerable, it would hardly occasion any sensible inconvenience to any one in particular. Hence the advantage of combining to lessen the injury arising from the accidental destruction of property: and it is the diffusion of the risk of loss over a wide surface, and its valuation, that forms the employment of those engaged in insurance.

Though it be impossible to trace the circumstances which occasion those events that are, on that account, termed accidental, they are, notwithstanding, found to obey certain laws. The number of births, marriages, and deaths; the proportions of male to female, and of legitimate to illegitimate births; the ships cast away; the houses burned; and a vast variety of apparently accidental events, are yet, when our experience embraces a sufficiently wide field, found to be nearly equal in equal periods of time; and it is easy, from observations made upon them, to estimate the sum which an individual should pay, either to guaranty his property from risk, or to secure a certain sum for his heirs at his death. It must, however, be carefully observed, that no confidence can be placed in such estimates, unless they are deduced from a very wide induction. Suppose, for example, it happens that during the pres-

ent year one house is accidentally burned, in a town containing 1,000 houses; this would afford very little ground for presuming that the *average* probability of fire in that town was 1 to 1,000. For it might be found that not a single house had been burned during the previous 10 years, or that 10 were burned during each of these years. But supposing it were ascertained, that, at an average of 10 years, 1 house had been annually burned, the presumption that 1 to 1000 was the real ratio of the probability of fire, would be very much strengthened; and if it were found to obtain for 20 or 30 years together, it might be held, for all practical purposes at least, as indicating the precise degree of probability.

Besides its being necessary, in order to obtain the true measure of the probability of any event, that the series of events, of which it is one, should be observed for a rather lengthened period, it is necessary, also, that the events should be numerous, or of pretty frequent occurrence. Suppose it were found, by observing the births and deaths of 1,000,000 individuals, taken indiscriminately from among the whole population, that the mean duration of human life was 40 years; we should have but very slender grounds for concluding that this ratio would hold in the case of the next 10, 20, or 30 individuals that are born. Such a number is so small as hardly to admit of the operation of what is called the *law of average*. When a large number of lives is taken, those that exceed the medium term are balanced by those that fall short of it; but when the number is small, there is comparatively little room for the principle of compensation, and the result can not, therefore, be depended upon. It is found, by the experience of all countries in which censuses of the population have been taken with considerable accuracy, that the number of male children born is to that of female children in the proportion nearly of 22 to 21. But unless the observations be made on a very large scale, this result will not be obtained. If we look at particular families, they sometimes consist wholly of boys, and sometimes wholly of girls; and it is not possible that the boys can be to the girls of a single family in the ratio of 22 to 21. But when, instead of confining our observations to particular families, or even parishes, we extend them so as to embrace a population of 500,000, these discrepancies disappear, and we find that there is invariably a small excess in the number of males born over the females.

The false inferences that have been drawn from the doctrine of chances, have uniformly, almost, proceeded from generalizing too rapidly, or from deducing a rate of probability from such a number of instances as do not give a fair average. But when the instances on which we found our conclusions are sufficiently numerous, it is seen that the most anomalous events, such as suicides, deaths by accidents, the number of letters put into the post-office without any address, etc., form pretty regular series, and consequently admit of being estimated *a priori*. The business of insurance is founded upon the principles thus briefly stated. Suppose it has been remarked that of forty ships, of the ordinary degree of sea-worthiness, employed in a given trade, one is annually cast away, the probability of loss will plainly be equal to *one fortieth*. And if an individual wish to insure a ship, or the cargo on board a ship, engaged in this trade, he ought to pay a premium equal to the 1-40th part of the sum he insures, exclusive of such an additional sum as may be required to indemnify the insurer for his trouble, and to leave him a fair profit. If the premium exceed this sum, the insurer is overpaid; and if it fall below it, he is underpaid.

Insurances are effected sometimes by societies, and sometimes by individuals, the risk being in either case diffused among a number of persons. Companies formed for carrying on the business have generally a large subscribed capital, or such a number of propri-

etors, as enables them to raise, without difficulty, whatever sums may at any time be required to make good losses. Societies of this sort do not limit their risks to small sums; that is, they do not often refuse to insure a large sum upon a ship, a house, a life, etc. The magnitude of their capitals affords them the means of easily defraying a heavy loss; and their premiums being proportioned to their risks, their profit is, at an average, independent of such contingencies.

Individuals, it is plain, could not act in this way, unless they were possessed of very large capitals; and besides, the taking of large risks would render the business so hazardous, that few would be disposed to engage in it. Instead, therefore, of insuring a large sum, as \$20,000, upon a single ship, a private underwriter or insurer may not, probably, in ordinary cases, take a greater risk than \$200 or \$500; so that, though his engagements may, when added together, amount to \$20,000, they will be diffused over from 40 to 100 ships; and supposing one or two ships to be lost, the loss would not impair his capital, and would only lessen his profits. Hence it is, that while one transaction only may be required in getting a ship insured by a company, 10 or 20 separate transactions may be required in getting the same thing done at Lloyd's, or by private individuals. When conducted in this cautious manner, the business of insurance is as safe a line of speculation as any in which individuals can engage. To establish a policy of insurance on a fair foundation, or in such a way that the premiums paid by the insured shall exactly balance the risks incurred by the insurers, and the various necessary expenses to which they are put, including, of course, their profit, it is necessary, as previously remarked, that the experience of the risks should be pretty extensive. It is not, however, at all necessary, that either party should inquire into the circumstances that lead to those events that are most commonly made the subject of insurance. Such a research would, indeed, be entirely fruitless: we are, and must necessarily continue to be, wholly ignorant of the causes of their occurrence.

It appears, from the accounts given by Mr. Scoresby, in his valuable work on the Arctic Regions, that of 586 ships which sailed from the various ports of Great Britain for the northern whale fishery, during the four years ending with 1817, eight were lost (vol. ii., p. 131), being at the rate of one ship out of every 73 of those employed. Now, supposing this to be about the average loss, it follows that the premium required to insure against it should be 1.70 per cent., exclusive, as already observed, of the expenses and profits of the insurer. Both the insurer and the insured would gain by entering into a transaction founded on this fair principle. When the operations of the insurer are extensive, and his risks spread over a considerable number of ships, his profit does not depend upon chance, but is as steady, and may be as fairly calculated upon, as that of a manufacturer or a merchant; while, on the other hand, the individuals who have insured their property have exempted it from any chance of loss, and placed it, as it were, in a state of absolute security.

It is easy, from the brief statement now made, to perceive the immense advantages resulting to navigation and commerce from the practice of marine insurance. Without the aid that it affords, comparatively few individuals would be found disposed to expose their property to the risk of long and hazardous voyages; but by its means insecurity is changed for security, and the capital of the merchant, whose ships are dispersed over every sea, and exposed to all the perils of the ocean, is as secure as that of the agriculturist. He can combine his measures and arrange his plans as if they could no longer be affected by accident. The chances of shipwreck, or of loss by unforeseen occurrences, enter not into his calculations. He has purchased an exemption from the effects of such

casualties; and applies himself to the prosecution of his business with that confidence and energy which nothing but a feeling of security can inspire. "Les chances de la navigation entravaient le commerce. Le système des assurances a paru; il a consulté les saisons; il a porté ses regards sur la mer; il a interrogé ce terrible élément; il en a jugé l'inconstance; il en a pressenti les orages; il a épié la politique; il a reconnu les ports et les côtes des deux mondes; il a tout soumis à des calculs savans, à des théories approximatives; et il a dit au commerçant habile, au navigateur intrépide: certes, il y a des désastres sur lesquels l'humanité ne peut que gémir; mais quant à votre fortune, allez franchissez les mers, déployez votre activité et votre industrie; je me charge de vos risques. Alors, Messieurs, s'il est permis de le dire, les quatre parties du monde se sont rapprochées."—*Code de Commerce, Exposé des Motifs*, liv., ii.

Besides insuring against the perils of the sea, and losses arising from accidents caused by the operation of natural causes, it is common to insure against enemies, pirates, thieves, and even the fraud, or, as it is technically termed, *barratry*, of the master. The risk arising from these sources of casualty being extremely fluctuating and various, it is not easy to estimate it with any considerable degree of accuracy; and nothing more than a rough average can, in most cases, be looked for. In time of war, the fluctuation in the rates of insurance is particularly great; and the intelligence that an enemy's squadron, or even a single privateer, is cruising in the course which the ships bound to or returning from any given port usually follow, causes an instantaneous rise in the premium. The appointment of convoys for the protection of trade during war, necessarily tends, by lessening the chance of capture, to lessen the premium on insurance. Still, however, the risk in such periods is, in most cases, very considerable; and as it is liable to change, very suddenly, great caution is required on the part of the underwriters.

Provision may also be made, by means of insurance, against loss by fire, and almost all the casualties to which property on land is subject. But, notwithstanding what has now been stated, it must be admitted that the advantages derived from the practice of insuring against losses by sea and land are not altogether unmixed with evil. The security which it affords tends to relax that vigilant attention to the protection of property which the fear of its loss is sure otherwise to excite. This, however, is not its worst effect. The records of our courts, and the experience of all who are largely engaged in the business of insurance, too clearly prove that ships have been repeatedly sunk, and houses burned, in order to defraud the insurers. In despite, however, of the temptation to inattention and fraud which is thus afforded, there can be no doubt that, on the whole, the practice is, in a public as well as private point of view, decidedly beneficial. The frauds that are occasionally committed raise, in some degree, the rate of insurance. Still it is exceedingly moderate; and it is most probable that the precautions adopted by the insurance offices for the prevention of fire, especially in great towns, where it is most destructive, outweigh the chance of increased conflagration arising from the greater tendency to carelessness and crime.

The business of life insurance has been carried to a far greater extent in Great Britain than in any other country, and has been productive of the most beneficial effects. Life insurances are of various kinds. Individuals without any very near connections, and possessing only a limited fortune, are sometimes desirous, or are sometimes, from the necessity of their situation, obliged annually to encroach on their capitals. But should the life of such persons be extended beyond the ordinary term of existence, they might be totally unprovided for in old age; and to secure themselves

against this contingency, they pay to an insurance company the whole or a part of their capital, on condition of its guarantying them, as long as they live, a certain annuity, proportioned partly, of course, to the amount of the sum paid, and partly to their age when they buy the annuity. But though sometimes serviceable to individuals, it may be questioned whether insurances of this sort are, in a public point of view, really advantageous. So far as their influence extends, its obvious tendency is to weaken the principle of accumulation; to stimulate individuals to consume their capitals during their own life, without thinking or caring about the interest of their successors. Were such a practice to become general, it would be productive of the most extensively ruinous consequences. The interest which most men take in the welfare of their families and friends affords, indeed, a pretty strong security against its becoming injuriously prevalent. There can, however, be little doubt that this selfish practice may be strengthened by adventitious means; such, for example, as the opening of government loans in the shape of life annuities, or in the still more objectionable form of *tontines*. But when no extrinsic stimulus of this sort is given to it, there do not seem to be any very good grounds for thinking that the sale of annuities by private individuals or associations can materially weaken the principle of accumulation.

Luckily, however, the species of insurance now referred to is but inconsiderable compared with that which has accumulation for its object. All professional persons, or those living on salaries or wages, such as lawyers, physicians, military and naval officers, clerks in public or private offices, etc., whose incomes must of course terminate with their lives, and a host of others, who are either not possessed of capital or can not dispose of their capital at pleasure, must naturally be desirous of providing, so far as they may be able, for the comfortable subsistence of their families in the event of their death. Take, for example, a physician or lawyer, without fortune, but making, perhaps, \$1000 or \$2000 a-year by his business; and suppose that he marries and has a family: if this individual attain to the average duration of human life, he may accumulate such a fortune as will provide for the adequate support of his family at his death. But who can presume to say that such will be the case?—that he will not be one of the many exceptions to the general rule?—And suppose that he were hurried into an untimely grave, his family would necessarily be destitute. Now, it is against such calamitous contingencies that life insurance is intended chiefly to provide. An individual possessed of an income terminating at his death, agrees to pay a certain sum annually to an insurance office; and this office binds itself to pay to his family at his death, a sum equivalent, after deduction of the expenses of management and the profits of the insurers, to what these annual contributions, accumulated at compound interest, would amount to, supposing the insured to reach the common and average term of human life. Though he were to die the day after the insurance has been effected, his family would be as amply provided for as it is likely they would be by his accumulations were his life of the ordinary duration. In all cases, indeed, in which those insured die before attaining the average age, their gain is obvious. But even in those cases in which their lives are prolonged beyond the ordinary term, they are not losers—they then merely pay for a security which they must otherwise have been without. During the whole period, from the time when they effect their insurances, down to the time when they arrive at the mean duration of human life, they are protected against the risk of dying without leaving their families sufficiently provided for; and the sum which they pay after having passed this mean term is nothing more than a fair compensation for the security they previously enjoyed. Of those

who insure houses against fire, a very small proportion only have occasion to claim an indemnity for losses actually sustained; but the possession of a security against loss, in the event of accident, is sufficient motive to induce every prudent individual to insure his property. The case of life insurance is in this respect different. When established on a proper footing, the extra sums which those pay whose lives exceed the estimated duration is but the value of the previous security. In order to adjust the terms of an insurance that the party insuring may neither pay too much nor too little, it is necessary that the probability of his life failing in each subsequent year should be determined with as much accuracy as possible.

To ascertain this probability, various observations have been made in different countries and periods, showing, out of a given number of persons born in a particular country or place, how many complete each subsequent year, and how many die in it, till the whole be extinct. The result of such observations, when collected and arranged in a tabular form, are called *Tables of Mortality*; being entitled, of course, to more or less confidence, according to the number and species of lives observed; the period when, and the care with which, the observations were made, etc. But supposing these tables to be formed with sufficient accuracy, the expectation of life at any age, or its mean duration after such age, may be readily learned from them; and hence also the value of an annuity, or the assurance on a life of any age. Thus, in the table of mortality for Carlisle, framed by Mr. Milne, of the Sun Life Office, and which is believed to represent the average law of mortality in England with very considerable accuracy, out of 10,000 persons, born together, 4000 complete their 56th year; and it further appears, that the number of such persons who die in their 66th year is 124; so that the probability that a life now 56 years of age will terminate in the 10th year hence is $\frac{124}{4000}$. But reckoning interest at 4 per cent., it appears (*Tables Interest and Annuities*), that the present value of \$100 to be received 10 years hence is \$67.556; consequently if its receipt be made to depend upon the probability that a life now 56 years of age will fail in the 66th year, its present value will be reduced by that contingency to $\frac{124 \times \$67.556}{4000} = \2.094 . The present value of \$100, receivable upon the life of a party now 56 years of age, terminating in the 57th or any subsequent year of his life, up to its extreme limit (which, according to the Carlisle table, is the 105th year), being calculated in this way, the sum of the whole will be the present value of \$100, receivable whenever the life may fail; that is, of \$100 insured upon it, supposing no additions were made to it for the profits and expenses of the insurers.

More compendious processes are resorted to for calculating tables of insurances at all ages; but the above statement sufficiently illustrates the principle on which they all depend. In practice, a life insurance is seldom made by the payment of a single sum when it is effected, but almost always by the payment of an *annual premium* during its continuance, the first being paid down at the commencement of the insurance.* If the Table of Mortality adopted by the insurers fairly represent the law of mortality prevailing among the insured, it follows that when a party insured does not attain to the average age according to the table, the insurers will either lose by him, or realize less than their ordinary profit; and when, on the other hand, the life of an insured party is prolonged beyond the tabular average, the profits of the insurers are proportionally increased. But if their business be so extensive as to enable the law of average fully to apply, what they lose by premature death will be balanced by the payments received from those who lives are

* For the method of calculating these annual premiums see *INTEREST AND ANNUITIES*.

prolonged beyond the mean duration of life for the ages at which they were respectively insured; so that the profits of the society will be wholly independent of chances.

The relief from anxiety afforded by life insurance very frequently contributes to prolong the life of the insured, at the same time that it materially augments the comfort and well-being of those dependent on him. It has also an obvious tendency to strengthen habits of accumulation. An individual who has insured a sum on his life, would forfeit all the advantages of the insurance were he not to continue regularly to make his annual payments. It is not, therefore, optional with him to save a sum from his ordinary expenditure adequate for this purpose. He is compelled, under a heavy penalty, to do so; and having thus been led to contract a habit of saving to a certain extent, it is most probable that the habit will acquire additional strength, and that he will either insure an additional sum or privately accumulate.

The practice of marine insurance, no doubt from the extraordinary hazard to which property at sea is exposed, seems to have long preceded insurances against fire and upon lives. We are ignorant of the precise period when it began to be introduced; but it appears most probable that it dates from the end of the 14th or the beginning of the 15th century. It has, however, been contended by Loccenius (*De Jure Maritimo*, lib. ii., c. 1), Puffendorf (*Droit de la Nature et des Gens*, lib. v., c. 9), and others, that the practice of marine insurance is of much higher antiquity, and that traces of it may be found in the history of the Punic wars. Livy mentions, that during the second of these contests, the contractors employed by the Romans to transport ammunition and provisions to Spain, stipulated that government should indemnify them against such losses as might be occasioned by the enemy, or by tempests, in the course of the voyage.—*Impetratum fuit, ut quæ navibus imponerentur ad exercitum Hispaniensem deferenda, ab hostium tempestatisque vi, publico periculo essent*.—Hist., lib. xxiii., c. 49. Malynes (*Lex Mercatoria*, 3d ed., p. 105), founding on a passage in Suetonius, ascribes the first introduction of insurance to the emperor Claudius, who, in a period of scarcity at Rome, to encourage the importation of corn, took upon himself all the loss or damage that it might sustain in the voyage thither by storms and tempests.—*Negotiatoribus certa lucra proposuit, suscepto in se damno, si quid per tempestates accideret, et naves mercature causâ, fabricantibus, magna commoda constituit*.—c. 18. It is curious to observe that this stipulation gave occasion to the commission of acts of fraud, similar to those so frequent in modern times. Shipwrecks were pretended to have happened, that never took place: old shattered vessels, freighted with articles of little value, were purposely sunk, and the crew saved in boats; large sums being then demanded as a recompense for the loss. Some years after, the fraud was discovered, and some of the contractors were prosecuted and punished.—Lib. xxv., c. 3. But none of these passages, nor a similar one, in Cicero's Letters (*Ad Fam.*, lib. ii., c. 17), warrant the inferences that Loccenius, Malynes, and others have attempted to draw from them. Insurance is a contract between two parties; one of whom, on receiving a certain premium (*pretium periculi*), agrees to take upon himself the risk of any loss that may happen to the property of the other. In ancient, no less than in modern times, every one must have been desirous to be exonerated from the chance of loss arising from the exposure of property to the perils of the sea. But though, in the cases referred to, the carriers were exempted from this chance, they were not exempted by a contract *propter aversionem periculi*, or by an insurance; but by their employers taking the risk upon themselves. And it is abundantly obvious that the object of the latter in doing this was not to profit, like an insurer,

by dealing in risks, but to induce individuals the more readily to undertake the performance of an urgent public duty.

But with the exception of the instances now mentioned, nothing bearing the remotest resemblance to an insurance is to be met with till a comparatively recent period. If we might rely on a passage in one of the Flemish chroniclers, quoted by the learned M. Pardessus—see his excellent work, *Collection des Loix Maritimes*, tome i., p. 356—we should be warranted in concluding that insurance had been effected at Bruges so early as the end of the 13th century; for the chronicler states that, in 1311, the Earl of Flanders consented, on a requisition from the inhabitants, to establish a chamber of insurance at Bruges. M. Pardessus is not, however, inclined to think that this statement should be regarded as decisive. It is evident from the manner in which the subject is mentioned, that the chronicler was not a cotemporary; and no trace can be found, either in the archives of Bruges, or in any authentic publication, of any thing like the circumstance alluded to. The earliest extant Flemish law as to insurance, is dated in 1527; and none of the early maritime codes of the North so much as alludes to this interesting subject.

Beckmann seems to have thought that the practice of insurance originated in Italy, in the latter part of the 15th, or early part of the 16th century.—*Hist. of Invent.*, vol. i., art. INSURANCE. But the learned Spanish antiquary, Don Antonio de Capmany, has given, in his very valuable publication on the History and Commerce of Barcelona (*Memorias Historicas sobre la Marina, etc., de Barcelona*, tomo ii., p. 388), an ordinance relative to insurance, issued by the magistrates of that city in 1435; whereas, the earliest Italian law on the subject is nearly a century later, being dated in 1523. It is, however, exceedingly unlikely, had insurance been as early practiced in Italy as in Catalonia, that the former should have been so much behind the latter in subjecting it to any fixed rules; and it is still more unlikely that the practice should have escaped, as is the case, all mention by any previous Italian writer. We, therefore, agree entirely in Capmany's opinions, that, until some authentic evidence to the contrary be produced, Barcelona should be regarded as the birth-place of this most useful and beautiful application of the doctrine of chances.—Tom. i., p. 237.

A knowledge of the principles and practice of insurance was early brought into England. According to Malynes (*Lex Mercat.*, p. 105), it was first practiced among us by the Lombards, who were established in London from a very remote epoch. It is probable it was introduced some time about the beginning of the 16th century; for it is mentioned in the statute 43 Eliz., c. 12, in which its utility is very clearly set forth, that it had been an *immemorial usage* among merchants, both English and foreign, when they made any great adventure, to procure insurance to be made on the ships or goods adventured. From this it may reasonably be supposed that insurance had been in use in England for at least a century previous. It appears from the same statute, that it had originally been usual to refer all disputes that arose with respect to insurances to the decision of "grave and discreet" merchants appointed by the Lord Mayor. But abuses having grown out of this practice, the statute authorized the Lord Chancellor to appoint a commission for the trial of insurance cases; and in the reign of Charles II. the powers of the commissioners were enlarged. But this court soon after fell into disuse; and, what is singular, no trace can now be discovered of any of its proceedings.—MARSHALL on Insurance, Prelim. Disc., p. 26.

Few questions as to insurance seem to have come before the courts at Westminster till after the middle of last century. The decisions of Lord Mansfield may, indeed, be said to have fixed, and in a consider-

able degree formed, the law upon this subject. His judgments were not bottomed on narrow views, or on the municipal regulations of England; but on those great principles of public justice and convenience which had been sanctioned and approved by universal experience. His deep and extensive information was acquired by consulting the most intelligent merchants, and the works of distinguished foreign jurists; and by carefully studying the famous French ordinance of 1681, the most admirably digested body of maritime law of which any country has ever had to boast. Hence the comprehensiveness and excellence of his lordship's decisions, and the respect they have justly commanded in all countries. In his hands the law of insurance became, in a far greater degree than any other part of English law, a branch of that national or public law, of which Cicero has beautifully said, "*Non erit alia lex Rome, alia Athenis, alia nunc, alia posthac, sed et omnes gentes et omni tempore una lex et sempiterna, et immortalis continebit, unusque erit communis quasi magister et imperator omnium Deus.*"—*Fragm., lib. iii., de Republica.*

Insurance against fire and upon lives is of much later origin than insurance against perils of the sea. The former, however, has been known and carried on among us, to some extent, at least, for nearly a century and a half. The Amicable Society, for insurance upon lives, was established by charter of Queen Anne, in 1706; the Royal Exchange and London Assurance Companies began to make insurances upon lives, in the reign of George I.; and the Equitable Society was established in 1762. But the advantages of life insurance, and the principles on which the business should be conducted, were then very ill understood, and the practice can hardly be said to have obtained any firm footing among us, till the Equitable Society, by adopting the judicious suggestions of Dr. Price, began its career of prosperity about 1775. Notwithstanding the example of England, life insurance has made comparatively little progress on the Continent. It was, indeed, expressly forbidden by the French ordinance of 1681 (liv. iii., tit. 6, art. 10); by the regulations as to insurance issued at Amsterdam in 1612 (art. 24); and it is doubtful whether the practice be not inconsistent with the 334th art. of the *Code de Commerce*, though it be now extensively carried on in France. But we are inclined to think that the want of security, more than any positive regulations, has been the principal cause of the little progress of life insurance on the Continent.

II. INSURANCE (MARINE).—There are few persons who are not acquainted, in some degree, with fire and life insurances. The security which they afford to individuals and families is a luxury which nobody, in tolerably comfortable circumstances, is willing to be without. Hence the great increase, in our days, of companies professing to afford this security; and hence the knowledge, on the part of the public generally, of the nature and principles of the engagements into which these companies enter. But marine insurance is a subject which is of immediate interest only to merchants and ship owners; unless, indeed, we should refer to that small portion of the community who have occasion to transport themselves beyond seas with capital and effects for purposes of colonization, or to fill some official situation. Hence the comparative indifference, on the part of the public, as to this subject. The general principles, however, of all insurance are the same; and in treating of marine insurance, it will be necessary to notice little beyond such topics as are peculiar to that branch of the business.

Individual Insurers, or Underwriters.—The first circumstance that can not fail to strike the general inquirer into the practice of marine insurance in this country, is that, while all fire and life insurances are made at the risk of companies, which include within themselves the desirable requisites of security, wealth,

and numbers, a large proportion of marine insurances is made at the risk of individuals.

Prohibition of Companies.—Till 1824, in Great Britain, all firms and companies, with the exception of the two chartered companies, the Royal Exchange and London, were prohibited by law from taking marine insurances. Toward the latter end of that year, the prohibition was removed, and the business of marine insurance was placed on the same legal footing as other descriptions of business. While the restriction lasted, the two chartered companies did so little business that marine insurance might in fact, be said to be wholly in the hands of individuals. These companies were so much higher in their premiums, and so much more exclusive in the risks they were willing to undertake, than their individual competitors, that even those merchants and ship owners, who would cheerfully have paid some trifling consideration to obtain the greater security of a company, were obliged to resort to individuals. And it was only when the repeal of this absurd restriction was proposed, that the companies showed, by defending it, that they set any value upon their privilege. The underwriters at Lloyd's joined them in this opposition; and pamphlets were written and speeches made, to demonstrate how much merchants and ship owners would suffer, were the law to allow them the free use of their discretion in insuring their property; and how much more conducive to their interests it was, that they should be forced up to Lloyd's, to pay premiums to individuals rather than companies. But these pamphlets and speeches are forgotten; and we should be sorry to wound the feelings of their authors, or to trespass on the patience of our readers, by referring to them more particularly.

Mode of conducting Business.—We shall now give an account of the arrangement in England for conducting the business of marine insurance, as well by individuals as the companies.

Lloyd's.—The individual underwriters meet in a subscription room at Lloyd's. The joint affairs of the subscribers to these rooms are managed by a committee chosen by the subscribers. Agents (who are commonly styled Lloyd's agents) are appointed in all the principal ports of the world, who forward, regularly, to Lloyd's, accounts of the departures from and arrivals at their ports, as well as of losses and other casualties; and, in general, all such information as may be supposed of importance toward guiding the judgment of the underwriters. These accounts are regularly filed, and are accessible to all the subscribers. The principal arrivals and losses are, besides, posted in two books, placed in two conspicuous parts of the room; and also in another book, which is placed in an adjoining room, for the use of the public at large. The rooms are open from 10 o'clock in the morning till 5 o'clock in the afternoon, but the most considerable part of the business is transacted between 1 and 4. Those merchants and ship owners who manage their own insurance business, procure blank policies at the government office, or of their stationers, which they fill up so as to meet the particular object in view, and submit them to those underwriters with whom they are connected; by whom they are subscribed or rejected. Each policy is handed about in this way until the amount required is complete. The form of the policy and of a subscription is subjoined to this article. The premium is not paid to the underwriter in ready money, but is passed to account. Nor does the underwriter debit the account of the person to whom he subscribes a policy with the whole amount of the premium, but with the premium less 5 per cent. Whenever losses occur which more than absorb the premiums on any one account, the underwriter is called upon to pay the balance. But should the underwriter's account be what is called good, that is, should the premiums exceed the claims, he sends round, during

the spring and summer, to collect from his various debtors either the balance of his last year's account, or money on account, according to his judgment; but upon what he receives, he makes an allowance of 12 per cent. An underwriter, if prudent, therefore, before he consents to receive, will not only look to the goodness of his account, but to the probability of its continuing so.

Insurance Brokers.—Many merchants and ship owners do not transact their own insurance business. They give their orders for insurance to others, who undertake it for them, and are responsible for its proper management. These latter persons are called insurance brokers; and some of them manage the business of a number of principals. To them, likewise, are transmitted the orders for insurance from the outports and manufacturing towns. They charge the whole premium to their principals, and their profits consist in 5 per cent. upon the premium, 12 per cent. upon the money that they pay to the underwriters, and $\frac{1}{2}$ per cent. that they deduct from all the claims which they recover from the underwriters. It is proper to remark that this is the established or regular profit; but competition has occasioned numerous deviations from it by the brokers, many of whom consent to divide this profit with the principals who employ them. The insurance brokers are not unfrequently underwriters also; and as some insurances are considered far more lucrative than others to underwriters, and as the brokers have particular facilities, in some respects, of judging of the goodness of their own risks, so likewise have they an inducement to play into one another's hands, and they do so accordingly. See BROKERS.

Payment of Losses.—Losses are paid at all the offices promptly, and without deduction. In England, a month's credit is allowed to the underwriters; and another month, and sometimes two months, are given to the broker, to collect from the underwriters, and pay over to his principals.

Clubs.—Besides the individual underwriters and companies above noticed, there are clubs or associations formed by ship owners, who agree, each entering his ships for a certain amount, to divide among themselves one another's losses. These clubs are institutions of long standing; but, since the alteration of the law in 1824, appear to be on the decline. Their formation originated in a twofold reason: first, that the underwriters charged premiums more than commensurate with the risk; and secondly, that they did not afford adequate protection. To avoid the first of these two evils, instead of paying a fixed premium, they pay among themselves the actual losses of their several members as they occur; and to avoid the second, they lay down certain principles of settlement in accordance with their views of indemnity. Each member of one of these clubs gives his power of attorney to the selected manager; and this manager issues a policy for each ship, which policy is subscribed by him as attorney for all the members, the premium inserted in the policy being understood to be nominal. These clubs are open to the leading objections that apply to individual underwriters; for the members are not collectively, but only individually, liable to those of their number who happen to sustain a loss; and the delay of settlement is such, that more than 12 months have been known to elapse before the payment of a loss has been obtained from all the members.

Rate of Premium.—But little need be said upon the circumstances that influence the rate of premium demanded by the insurers. It must be self-evident that premiums will vary according to the seasons, the quality of the vessel, the known character of the captain, the nature of the commodity, and the state of our political relations. All these, of course, are matters upon which each individual must exercise his own discretion, partly from general experience, and partly

from particular information; exaggeration of risk, and consequent exorbitancy of premium for any length of time, being out of the question, where so many individual underwriters, in addition to the companies, are in competition with one another, and where the merchants have the means at hand of effecting their insurances abroad. We have already taken notice of the intelligence of which Lloyd's is the focus. In addition to this there is a subscription register book for shipping maintained by the principal merchants, ship-owners, and underwriters. This book professes to give an account of the tonnage, build, age, repairs, and quality of almost all the vessels that frequent our ports; and, although exceedingly defective in many respects, is a material assistance to the insurers, who have no means of ascertaining by their own observation the particulars of one in a hundred of the ships they are called upon to insure.

Contract of Insurance.—Having thus given a general outline of the mode of transacting business between the insurers and insured, and the means used to enable both parties to come, as near as possible, to a due estimate of the risk to be insured against, our next step will be to explain the nature of the contract, and the bearing of its more important clauses.

It is unnecessary to state that the object of those who are engaged in commerce, or in moving articles of merchandise from one part of the world to another, is to *buy* at such a price that, after paying all the expenses of transport, the *sale* price may leave them a surplus in the shape of profit. If there were no such contrivance as insurance, merchants would be obliged to calculate upon the probability of the occasional loss of their property, and to regulate their transactions accordingly; but it must be obvious that enterprise, under such circumstances, would be very much crippled. Now, insurance, in as far as it approaches perfection in guarantying the merchant against all loss, except that of the market, substitutes a fixed charge for uncertain and contingent loss, and enables him to confine his attention exclusively to price and quality, and to charges of transport; in which latter, of course, the premium of insurance is included. As, however, in practice, insurance is by no means a perfect protection, either to the merchant or ship owner, against all loss that may occur *in transitu*, there is, even after insurance, some contingencies remaining to be taken into consideration; and we do not know that we can do better, by way of explaining the contract of insurance, than state, as briefly and succinctly as possible, what are the losses against which the merchant and ship owner are not protected by an insurance effected in this country.

1. *Acts of our own Government.*—All losses arising from the acts of our own government. Thus, if an embargo were laid on vessels about to sail for a particular quarter, and the merchant obliged to unload his goods; or if his goods were condemned to be destroyed in quarantine; or purposely destroyed at sea by some of our cruisers; no part of his loss would be made good by the insurer. The insurer in this country, although liable for the acts of foreign powers, is not liable for such acts directed against the property of their own subjects. Thus, if French property, insured in this country, were confiscated by the French government, the owner would have no remedy against his insurer.

2. *Breaches of the Revenue Laws.*—All losses arising from a breach of the revenue laws. It may be observed, that if the owner of the ship, by his act, expose the goods of the merchant to loss, the merchant so injured, although he can not recover from his insurers, may claim from him. It may also be observed, that if the captain of the vessel, by his act, to which neither the owner of the ship nor the merchant is a party, expose the ship and cargo to loss, the insurers, in such case, are bound to make good the loss; the

insurers being liable for all damage arising from illegal acts of the captain and crew, supposing the owner of the ship not to be accessory. The illegal acts of the captain and crew, contrary to the instructions and without the consent of the owners, are termed "barratry" in the policy. See BARRATRY.

3. *Breaches of the Law of Nations.*—All losses arising from a breach of the law of nations. Thus, if any port is declared by a foreign power to be in a state of blockade, and such blockade is acknowledged by our government; and if a ship, in defiance of that notification, attempt to break the blockade, and is taken in the attempt; the insurer is not liable for the loss. It will often happen, when a port is under blockade, that the profit is so great upon goods introduced in defiance of the blockade, as to tempt adventurers to break it, and to enable them to afford a very high premium to insure against the risk. But as policies for such an object are not acknowledged in our courts of law, when effected, they are understood to be *policies of honor*. The same kind of policy is adopted by underwriters, to protect foreign merchants who prefer insuring in this country against capture by our vessels.

4. *Consequences of Deviation.*—All losses subsequent to any deviation from the terms of the policy. Thus, if a merchant, in a policy on produce from the West Indies to London, warrant the ship to sail on or before the 1st of August, and the ship sail after that day and be lost, the insurer is exonerated. Or, if a merchant insure from London to Lisbon, and the ship call at Havre and is afterward lost, the insurer is not liable. It will be understood, of course, that the owner of the ship is liable to the merchant for any breach of contract on his part, as well as that the insurer is liable for the barratry of the master; a deviation on the part of the master, not intended for the benefit of the owner, and contrary to his instructions, being considered barratry. Should the owner of the goods neglected to describe accurately the voyage for which he wishes to be insured, the loss would be a consequence of his own negligence.

There is a doctrine connected with barratry which it will here be proper to notice. A captain, owner or part owner of the ship in which he sails, can not commit an act of barratry. In other words, the insurers are not, in such a case, liable for an act of his which would otherwise be barratrous. The equity of this doctrine, as far as regards the interests of the captain himself, can not be called in question; but it is difficult to understand why the merchant who ships goods on board such a captain's vessel should not be permitted to insure, among other risks, against the captain's illegal acts. We have heard that a clause has occasionally been introduced into policies to protect merchants against captain-owners, and we do not suppose that our courts of law would refuse to enforce such a clause. Indeed, we can not discover any reason why every party, saving the captain, should not have the power of insuring against the consequences of illegal acts of the captain. We believe, that among the life offices which protect themselves from loss by suicide and the hands of justice, there are some which make a distinction in favor of those who merely hold policies on the lives of others as a collateral security. The propriety of such a distinction must strike every body.

5. *Unseaworthiness.*—All losses arising from unseaworthiness. Unseaworthiness may be caused in various ways, such as want of repair, want of stores, want of provisions, want of nautical instruments, insufficiency of hands to navigate the vessel, or incompetency of the master. It might be supposed, at first sight, that insurance affords a much less perfect security than it really does, seeing on how many pleas it is possible for the insurer to dispute his liability; but when it is considered that the proof of unseaworthiness is thrown upon the defendant, and that the leaning of the courts is almost always in favor of the insured, it

will be easy to suppose that no respectable insurers would ever plead unseaworthiness unless they could make out a case of more than ordinary strength and clearness. The degree of uneasiness felt by merchants and ship owners at their liability to be involved in loss by cases of unseaworthiness, may be guessed from the fact that although the Indemnity Insurance Company at one time precluded themselves from pleading unseaworthiness by a special clause in their policy, not only did they obtain no additional premium in consequence thereof, but they did not even obtain a preference over other companies and individuals at the same premiums. At least, this fact must be either admitted as a proof of the absence of uneasiness on this head, or of that inveteracy of habit which seems to lead the great bulk of mankind always, if possible, to continue undeviatingly in those courses to which they are accustomed, even where the benefits to be derived from a deviation are undeniable.

6. *Protraction of the Voyage.*—All loss arising from unusual protraction of the voyage. Thus, if a ship meet with an accident in the Baltic, and the repairs detain the vessel till the close of the season, when the passage home is rendered impracticable by the ice till the opening of the ensuing season, no payment is made to the merchant, in mitigation of his loss from interest of money, loss of market (if the market fall), or deterioration in the quality of his goods (unless arising from actual sea damage); nor to the ship owner, in mitigation of his loss from the extra wages and maintenance of his crew. In most foreign countries the ship owner is remunerated by the insurers for the wages and maintenance of his crew while his ship is detained in consequence of any loss for the making good of which they are liable.

7. *Liability for doing Damage to other Vessels.*—All loss to which the ship owner is liable when his vessel does damage to others. According to our laws, the owner of every ship not in charge of a pilot, that does damage, by negligence of the master and crew, to any description of craft or vessel, is liable to make good the same to the extent of the value of his own ship and freight: for beyond this he is not liable. The common policy in use among the underwriters at Lloyd's and the companies does not protect the ship owner from this loss. But the clubs or associations before mentioned almost universally take this risk. Indeed, this is one of the purposes which gave rise to their formation. But even they limit their liability to the amount of the policy; so that if a ship insured with them were to run down another, and to sink herself in the concussion, the owner would only receive the value of his own vessel from the club, and still be liable to the owner of the other vessel. The Indemnity and Marine Companies, by a clause in their policies, make themselves liable for three fourths of the loss which the owner of the vessel insured with them may sustain from damage done by his vessel to those of others. If such a case as the one just supposed should occur under their policy, the insured would receive the value of his own vessel and three fourths of the loss to be made good by him to the owner of the other vessel. The policies of these companies approach in this respect the nearest of any to perfect protection to the ship owner. But the loss from running down other vessels, although serious, may sometimes ruinous, seldom occurs; and many ship owners trust so confidently that it will never fall upon them, that they are as well satisfied to be without as with this protection. The Supreme Court of the United States has confirmed a decision, to the effect, that where a collision takes place without fault in a port where the local law divides the whole loss (thereby opposing the general maritime law), the insurers were liable for it. This is opposed to the English decisions.

8. *Average Clause.*—The next description of loss of which we shall treat, against which the insured are

not protected, is described in the following clause of the policy: "Corn, fish, salt, seed, flour, and fruit, are warranted free from average, unless general, or the ship be stranded; sugar, tobacco, hemp, flax, hides, and skins are warranted free from average under 5 per cent., unless general, or the ship be stranded; and all other goods, also the ship and freight, are warranted free from average under 3 per cent., unless general, or the ship be stranded." The language employed in this clause, being technical, requires explanation to render it intelligible to the general reader. Average is a name applied to certain descriptions of loss, to which the merchant and ship owner are liable. There are two kinds of average, general and particular. *General Average* comprehends all loss arising out of a voluntary sacrifice of a part of either vessel or cargo, made by the captain for the benefit of the whole. Thus, if a captain throw part of his cargo overboard, cut from an anchor and cable, or cut away his masts; the loss so sustained, being voluntarily submitted to for the benefit of the whole, is distributed over the value of the whole ship and cargo, and is called "general average."

Particular Average comprehends all loss occasioned to ship, freight, and cargo, which is not of so serious a nature as to debar them from reaching their port of destination, and when the damage to the ship is not so extensive as to render her unworthy of repair. Losses where the goods are saved, but in such a state as to be unfit to forward to their port of destination, and where the ship is rendered unfit to repair, are called "partial or salvage loss." The leading distinction, between particular average and salvage loss is, that, in the first, the property insured remains the property of the assured—the damage sustained, or part thereof, as the case may be, and as will hereafter be explained, being made good by the insurer; and in the second, the property insured is abandoned to the insurer, and the value insured claimed from him, he retaining the property so abandoned, or its value.

Particular Average on Goods.—A few cases illustrative of the method of stating a claim for particular average will best explain the nature of this description of loss, and will at the same time show the reader what the practical distinction is between particular average and salvage loss.

The property insured we shall suppose to be a *ton of hemp*, the cost of which at Petersburg is \$150, for which sum it is insured from New York to London, and that the duty, freight, and charges to which the merchant is subject on landing at London are \$50. We shall likewise suppose that the hemp, on its arrival, is so damaged as not to be worth more than half what it would have fetched had it been sound. The insurer would then be called upon to make good to the insured \$75, or 50 per cent., upon the sum insured. But it does not follow that this payment of \$75 would indemnify the merchant, or that it would not more than indemnify him, for the loss sustained.

If the hemp upon arrival in that country would have fetched in a sound state.....	\$250 00	
Less duty, freight, and charges.....	50 00	
		\$300 00
But in its damaged state is only worth...	125 00	
Less duty, freight, and charges.....	50 00	
		75 00

The merchant's loss by the damage is.....\$125 00

Whereas he only receives from the insurer \$75. Upon the principle of a salvage loss he would also receive \$75.

If the hemp would have fetched in a sound state.....	\$100 00	
Less duty, freight, and charges.....	50 00	
		\$50 00
But in its damaged state is only worth...	50 00	
Less duty, freight, and charges.....	50 00	

The merchant's loss by the damage is.....\$50 00

Whereas he receives from the insurer \$75. Upon the principle of a salvage loss he would receive \$150.

If the hemp would have fetched in a sound state.....	\$150 00	
Less duty, freight, and charges.....	50 00	
		\$100 00
But in its damaged state is only worth...	75 00	
Less duty, freight, and charges.....	50 00	
		25 00

The merchant's loss by the damage is.....\$75 00

And he receives from the insurer \$75. Upon the principle of a salvage loss he would receive \$125.

It will be observed that the merchant's loss by the damage of his goods varies with the state of the market. It may also be observed, that in general the merchant will not receive from the insurer the whole amount of the loss that he sustains. Whenever his market is a profitable one (and that it must usually be so will be obvious to every body), whenever, indeed, his market is not a decidedly losing one, his policy does not afford him a complete protection.

The argument in favor of this mode of settling claims for particular average—and it should be observed that the subject has been discussed, and the principle acknowledged in the courts of law—is, that the insurer's liability is to be guided by the amount upon which he had received a premium or consideration; that he is not to be affected by the rise or fall of markets; but that the *gross* market price of the *sound*, and the *gross* market price of the *damaged* goods, are to be the test by which the rate of damage upon the amount insured is to be adjusted; the insurer being liable, besides, for all the extra charges arising out of the damage.

In the first case stated, the merchant's loss by damage is \$25 upon \$40, or 62½ per cent.; in the second, \$10 upon \$10, or 100 per cent.; in the third, \$15 upon \$20, or 75 per cent. If the duty, freight, and charges were diminished in proportion to the diminished value of the goods, the loss in each case would be 50 per cent. upon the net price, as it is 50 per cent. upon the gross price. As far as the duty is concerned, government, upon many articles, reduces it in proportion to the diminution in the value of the goods; and if the freight were reduced in a similar manner, the merchant would always be indemnified for his loss by the insurer. But the practice with regard to freight in this country admits of no such arrangement; freight being paid according to the quantity delivered.

To make the principle upon which claims for particular average are adjusted, and its bearing, still clearer, we shall illustrate it by a few more cases. Suppose two packages to be insured at cost price—a cask of rice and a cask of sugar—each weighing 10 cwt.; the cost of each at the port of shipment \$50, the freight of each 250 cents per cwt. at the port of delivery, both articles free from duty, and to arrive at a market where no more than the cost price is realized; assuming that both packages are damaged 50 per cent.—the rice by loss of quality, the sugar by loss of weight—the statement will be as follows:

10 cwt. of rice, had it arrived sound, would have produced.....	\$75 00	
Less freight on 10 cwt.....	25 00	
		\$50 00
But being damaged did only produce.....	37 50	
Less freight on 10 cwt. at 250 c. per cwt.....	25 00	
		12 50
Merchant's loss.....		\$37 50

10 cwt. of sugar, if sound, would have produced.....	\$75 00	
Less freight on 10 cwt. at 50 c. per cwt.....	25 00	
		\$50 00

The barrel, being damaged, did only weigh 5 cwt. and produce.....	37 50	
Less freight on 5 cwt. at 250 c. per cwt.....	12 50	
		25 00

Merchant's loss.....\$25 00

In each case the merchant is entitled to recover from his insurer \$25, or 50 per cent., upon \$50, the sum insured, which, although an indemnity to him for

his loss on the sugar, is far from being so for his loss upon the rice. If the merchant would contrive so to shape his contract with the ship owner for freight as to reduce the freight in proportion to the depreciation in the value of the damaged commodity, he would be completely protected. The ship owner might, on his side, protect himself by insurance from loss by reduction of quality, as he now does from loss by reduction of quantity. But we have already more than once adverted to the difficulty of breaking in upon established practices. The merchants go on from year to year complaining of the losses to which they are subjected from this awkward contrivance, while no steps are taken to improve it. To show that the principle is equitable as between the merchant and his insurer, we subjoin one more statement, where the damage is taken at 100 per cent.

10 cwt. of rice, if sound, would have produced.....	75 00	
Less freight on 10 cwt.	25 00	
		\$50 00
Being totally spoiled did produce nothing.		
The merchant being still liable for the freight....	25 00	
Making his loss.....		\$75 00
He receives \$50 only from the insurer.		
10 cwt. of sugar, if sound, would have produced.....	\$75 00	
Less freight on 10 cwt.....	25 00	
		\$50 00
The barrel being washed out produces nothing.		
The merchant, however, not being liable to pay freight		
His loss is only.....		\$50 00
Which he recovers from the insurer.		
It will be observed, that in each case the insurer pays \$50, or the full sum upon which he receives the premium.		

When whole cargoes, or parcels of goods of considerable value, are insured, the clause in the policy which protects the insurer from particular average under a certain percentage is often partially set aside. Thus, if a cargo of 500 hogsheds of sugar, valued at \$10,000, were damaged to the extent of \$460, the merchant, supposing the protecting clause to remain in force, would recover nothing from the insurer, the loss not amounting to 5 per cent. The additional written clause, by which it is the practice to modify the printed clause, is as follows: "Particular average, payable upon each 10 hds. sugar, 10 casks and 50 bags coffee, and 10 bags cotton, following numbers, and upon each package of manufactured goods, chest of indigo, bag of wool or silk, the same as if separately insured." Such clauses may be, and are, introduced *ad libitum* by mutual consent of insurer and insured, the premium or consideration being arranged accordingly. The protecting clause is considered, on the other hand, by the insurers, exceedingly unsatisfactory in some respects; and they, as occasion requires, insist upon additional protection. Thus, saltpetre, hides, cocoa, and tin plates, are generally warranted free from particular average, unless the ship be stranded; and upon tobacco, it is customary for the insurers to make themselves liable only to such part of the particular average as exceeds 5 per cent., throwing 5 per cent. upon the merchant.

Particular Average on Freight.—The clause, as far as it affects "freight," calls for no particular comment. Particular average upon freight can only arise, according to prevailing practice, from loss of weight; and whenever the loss of weight amounts to 3 per cent. or upward, the ship owner is entitled to recover from his insurer. The ship owner, upon the arrival of the ship at its port of destination, is entitled to hold the goods as security until the freight is paid. If the owner of the goods should prove insolvent, and the goods should be entirely spoiled by sea damage during the voyage, and the ship owner thus lose his freight, he has no claim upon the insurer; because, although his collateral security is destroyed by a peril of the sea, his right to receive freight remains unimpaired,

and it is against the loss or impairing of this right that the insurer protects him.

Particular Average on Ships.—Particular average upon ships is a subject somewhat more beset with difficulties. There is scarcely a ship that makes a voyage of any length that does not sustain some damage. The clause in the policy warranting the ship free from particular average under 3 per cent., unless stranded, protects the insurer from the constant recurrence of petty claims; but in addition to this, it is the practice to class the damage that a ship sustains in the prosecution of her voyage under two heads; ordinary damage, or wear and tear; and extraordinary damage, or particular average. The splitting of sails, the breaking of anchors and cables, the upsetting of windlasses, are losses that come under the first head. The carrying away of masts and bulwarks, damage to the copper sheathing and hull from striking on rocks, come under the second. When a ship sustains damage, if she be on her first voyage, the whole expense of the repairs is made good by the insurers. But if she be not on her first voyage, it is the established custom that the insurer pays no more than two thirds of the repairs, the owner of the vessel having, as it is thought, an equivalent for the one third which falls upon him, in the substitution of new work for old. Where the nature of the damage is such as to require that the copper should be stripped off the ship's bottom, the insurer pays the difference between the price of the old and the new copper on the weight of the old copper stripped off; the excess in weight of the new over the old copper is paid for by the ship owner; and the labor of stripping and replacing the copper is paid for on the principle already mentioned. In any general rule of this kind, it must be obvious that the ship owner will sometimes gain and sometimes lose by an accident. As soon as the ship owner, or his captain, learns that his vessel has met with an accident, or as soon after as possible, he summons regular surveyors to examine his vessel and report all defects, discriminating between those defects that have arisen from perils of the sea and those from wear and tear. The first only are made good by the insurer, together with all charges, such as surveyors' fees, dock dues, etc., caused by the necessity of undergoing repair. It has been already observed, that when a ship is obliged, in the progress of her voyage, to put into port for the purpose of repair, although the owner of the ship be subjected to great expense for the wages and maintenance of his crew during the detention, he can recover no part of this expense from the insurer; the doctrine being, that the owner of the ship is bound to navigate his vessel, and that the insurer does not undertake to guaranty that the voyage shall be completed within any specific time. Such is the doctrine, at least, in this country, and the practice is founded upon it; but in all other countries the doctrine and practice are the reverse. For in them allowance is made to the ship owner for the wages and maintenance of the crew during the whole period that the ship is under repair. Where a vessel sustains damage and undergoes repair in the progress of her voyage, and is subsequently lost, the insurer is liable both for the particular average and a total loss. Or the owner of the ship may, if he please, insure the amount expended in repair; and then, in the event of subsequent loss, the insurer is liable for the total loss only; but in the event of subsequent safe arrival, the average is augmented by the charge of insurance. The operation of the clause warranting the ship free from average under 3 per cent., unless general, or the ship be stranded, may now be clearly seen. If a ship be insured and valued at \$50,000, and the repairs of the vessel do not, after all the deductions above referred to, amount to 3 per cent., there is no claim upon the insurer, unless the vessel shall have been stranded. See AVERAGE.

Stranding.—The term stranded is not well chosen, admitting of more than one construction; and the clause of which it forms a part is imperfectly conceived. And in settlements of accounts, when differences arise, the parties who discuss them are more apt to strive for that interpretation of terms and clauses which is favorable to their interests, than for that which is best adapted for general purposes. It is commonly understood that merely striking the ground and coming off is not a stranding; it being necessary, in order to fall within that term, that the ship should remain on the ground or rock, as it may happen, and that efforts should be made to float her. Striking on an anchor and leaking dangerously is not a stranding. We shall only adduce two illustrations, for the purpose of showing how ill adapted this clause is as a means to an end. Corn and other such articles are warranted free from particular average, unless the ship be stranded, because the insurers, considering these articles to be peculiarly susceptible of damage, will not consent to take that risk, except on some extraordinary occasion. A ship laden with corn, makes a very stormy passage from the Baltic to London, and damages the whole of her cargo. Upon arrival off the coast she is stranded, but got off without straining or sustaining any damage. The insurer is held to be liable for the damage to the corn, under the clause of the policy. On another occasion, after a very favorable passage to the coast, a ship strikes upon a shoal, but is not stranded, sustaining, however, so much damage that she arrives at London with 6 feet of water in her hold, and her cargo almost wholly spoiled. The insurer is held not to be liable under the clause of the policy.

General Average.—The insurer is bound to make good all general average without exception, however trifling the amount. General average is treated as though altogether unconnected with particular average; and damage to the goods not amounting to 3 per cent. is not payable by the insurer, although there may be also a general average, and the general and particular average together may amount to more than 3 or 5 per cent. General average is a charge which must be paid by the merchant and ship owner, even if uninsured; although when insured, he transfers, as it were, in virtue of his insurance, the charge from himself to his insurer. All the elements that can by possibility enter into general average may be classed under four heads:—1. Sacrifice of part of the ship and stores; 2. Sacrifice of part of the cargo and freight; 3. Remuneration of services required for general preservation; 4. Expense of raising money to replace what has been sacrificed, and to remunerate services.

1. When any part of the ship is sacrificed for the general benefit, the owner is entitled to receive (deducting, of course, his share of contribution), the amount of his outlay in the replacing of such sacrifice; allowance being made, on the principle stated above, where old works and materials are replaced with new. The deduction of one third, however, does not invariably apply. For instance, one sixth only is taken off the price of an iron cable that is slipped from for the general benefit, because iron cables are calculated to last for a great number of years; and no reduction is ever made from the price of anchors. The charge of replacing the loss may amount to considerably more than the value lost, computing the value at the place where the ship was originally fitted. Thus, the cost of replacing an anchor and cable slipped from in the Downs, is frequently double the value of the anchor and cable at London. But whatever the charge may be, such charge forms the basis of settlement.

2. Sacrifice of the cargo and freight takes place in jettison, or where part of the cargo is flung overboard to lighten the vessel. Upon arrival in port, after such jettison, the owner of the goods jettisoned is entitled

to receive (deducting his share of contribution), what the goods would have produced nett to him, supposing them to have arrived sound; and the owner of the ship is entitled to receive (deducting his share of contribution), the freight to which he would have been entitled upon the same delivery of the goods.

3. Remuneration of services and other charges. When a ship loses her anchors and cables, very large sums are frequently awarded to boatmen who venture off to her with new ones at the imminent hazard of their lives. A ship disabled at sea is towed into port by another, and remuneration for such service is awarded according to the value saved, the detention occasioned, and the loss sustained. The ship rendering the service may be laden with fish or fruit, that may be totally spoiled by the detention, or may be in ballast. A ship captured by the enemy may be recaptured by a man of war or armed merchant vessel; here, again, salvage is awarded according to the circumstances of the case. All these charges are general average; that is to say, must be distributed over ship, freight, and cargo. When a ship, with her cargo, is driven on shore, the expense of attempting to get her off is general average. If she can not be got off without discharging, the expense of discharging is general average; but the expense of getting the ship off after the cargo has been taken out falls exclusively upon the ship. The warehousing of the cargo, and other expenses incurred for its preservation, are charges exclusively upon the cargo. The expense of reloading is borne by the freight. When a ship puts into port in distress, the pilotage inward is general average; the pilotage outward is a charge upon the freight. This distribution of charges has settled into a tolerably well established practice; and upon this principle claims are settled at the offices.

4. The money required to meet the above charges is sometimes attainable without expense. If the accident happen near home, and the ship owner be respectable, he advances the money and recovers from the various parties concerned so soon as the accounts can be made up; or if the accident happen in a foreign port, where the owner of the ship is well known, the captain's bill upon him will sometimes be received in payment of the charges incurred. But where such facilities do not exist, the captain is empowered to pledge his ship, freight, and cargo, as security to any one he may prevail upon to supply the necessary funds. This pledge is termed a bottomry bond. By it the captain admits the receipt of the money; consents to the payment of a premium (which varies with the distance of the port of destination, the risk of the voyage, the respectability of the owner, and the necessities of the captain); and assigns the ship, freight, and cargo, as security for the repayment of the money advanced and the stipulated premium. Should the captain consider the bottomry premium demanded of him exorbitant, or should he deem it preferable in other respects, he may sell a portion of the cargo for the purpose of raising such money as he may stand in need of toward the prosecution of his voyage. The expense of raising the requisite funds, whether by commission, by bottomry premium, or by loss on the sale of the cargo, is charged to those parties for whose interest the money is required. Thus, if a ship, having struck upon a rock, puts into port in distress, and is obliged to unload to repair; supposing the particular average upon the ship to amount to \$500; the general average, consisting of assistance into port and expense of unloading, \$200; particular charges on freight, consisting of expense of reloading and pilotage outward, \$100; and particular charges on cargo, consisting of warehouse rent and repair of packages, \$200; and the expense of raising money should be 20 per cent.—these sums would be severally increased by this addition, and would be raised to \$600, \$240, \$120, and \$340. See BOTTOMRY, RESPONDENTIA.

It still remains to be inquired in what proportion the general average is to be paid by the different owners of the cargo, and the owner of ship and freight. Almost all general averages are adjusted at the ship's port of destination, and the values of the ship and cargo are taken at what they would produce in their actual state upon arrival, and the freight, according to what is actually receivable, less the wages of the captain and crew; the general average being distributed in proportion to these values. Should the cargo be altogether worthless, it can not be made to contribute; and should the wages of the crew exceed the freight, then the freight is not liable to contribute. In case of jettison, the party whose property has been sacrificed for the general benefit receives indemnity on the same principle; the value to which he is entitled being what his property would have produced *nett*, supposing it to have been sold on the arrival of the vessel—the same value serving for the basis of his proportion of contribution. Some few cases occur where the general average is adjusted at the port of departure. Thus, if a ship, outward bound to the British colonies, cut from an anchor and cable in the Downs, or incur other general average on our own coast, the insurances being principally effected in this country, it is the custom to adjust it on the spot, by which means both delay and expense are avoided. On these occasions, the values at the port of shipment are taken as the basis of contribution. A total loss, subsequently to a general average, does not exonerate the insurer from his prior liability; and although it is customary with the ship owner, or his agent, specifically to insure the money expended in average, for the purpose of protecting the insurer against any greater liability than 100 per cent., he is not absolutely obliged to do so. When the average funds are raised by bottomry, the party advancing them takes the ship, freight, and cargo, as security, and charges a premium to cover the risk of the ship's non-arrival at her port of destination. And thus, on such an occasion, a subsequent total loss relieves the insurer from all liability to average. The law and customs by which averages are adjusted vary in different countries; but the insurer in this country is only liable for the averages adjusted according to our laws. The merchant, however, whose goods arrive at a foreign port, is obliged to submit to the laws of that port. He may thus be a considerable loser; paying general average according to one law, and receiving from his insurer according to another. And he never can be a gainer, because, before he is entitled to recover from his insurer, he must prove that he has paid to the owner of the ship. This is one of the many inconveniences to which mercantile men are exposed, which can not be removed without, what it may be hoped will gradually take place, an assimilation of the commercial laws of different countries.

Proof of Loss.—The policy of insurance is the instrument under which the merchant and ship owner claim indemnification for all losses that are not specially excepted. The proof that the loss has been sustained must also be exhibited; such as the title to the vessel and cargo, and the evidence of the captain and crew to establish the circumstances out of which the claim arises. If A were to insure his vessel for the space of 12 months, and at the expiration of 6 months were to sell his ship to B: A's interest in the vessel having ceased, so also does his insurer's liability; and B, if he wish to be protected, must make a new insurance. Proof of ownership, therefore, is an essential preliminary to the recovery of a claim. In general practice, no difficulty arises from this, because the fact of ownership is sufficiently notorious. The bill of lading is, in most cases, satisfactory proof that the cargo was on board, as well as of the amount of freight.

Valued and open Policies.—If an insurance for \$10,000 be effected upon 100 hhds. of sugar, valued at

\$100 per hhd., the bill of lading, showing that the vessel had 100 hhds. on board, establishes the interest at \$10,000, and the policy is termed a valued policy. But if an insurance for \$10,000 be effected on 100 hhds. of sugar, and nothing be expressed as to value, the bill of lading only establishes that 100 hhds. are on board, without establishing the amount of interest. The production of the invoice, showing the cost of the goods, is necessary to that end, the policy being termed an open one.

Return of Premium for short Interest.—In a valued policy, when the whole of the property insured does not appear to have been shipped, the difference between the quantity insured and the quantity shipped is termed short interest. Thus, if \$10,000 be insured upon 100 hhds. of sugar, valued at \$100 per hhd., and 80 hhds. only be shipped; as the insurer's liability does not extend beyond \$8,000, so he is obliged to return the premium upon \$2,000 to which no risk attaches. This return of premium is called a return for short interest.

For Over-Insurance.—In an open policy, where the value shipped is not equal to the value insured, the difference is termed over-insurance. If a merchant insures in London for £5,000 upon goods, without specifying any value, from Calcutta to London, the premium being £3 and the stamp duty 5s. per cent., the amount of interest that attaches to the policy is so fixed, that he is neither to gain nor lose by the transaction in the event of the vessel's loss, supposing his insurance to be sufficient. To entitle him to recover a profit, the profit to be insured must be stipulated in the policy. The expense of insurance upon £100 being 3.25, it is clear that every £100 insurance covers 96.75 original cost, that is to say, protects the merchant from loss to that extent in case of the loss of the vessel. If then, we assume the invoice of the goods shipped to be 40,000 rupees, or, at the exchange of .10c. per rupee, £4,000, the interest attaching to the policy is ascertained as follows:—If 96.75 cost is insured by £100 insurance, what will £4,000 cost be insured by? Answer, £4,135. Under such circumstances, although a policy exists for £5,000, the insured is not able to prove interest for more than £4,135; and consequently, the insured being entitled to recover no more than that sum in case of loss, the insurer is called upon to make a return of premium for over-insurance upon £865.

Although we have treated separately of returns for short interest and over-insurance, we should observe that these terms in practice are used indiscriminately; and, indeed, we can not say that we perceive much advantage in making the distinction, or preserving the distinctive appellations. It sometimes happens that the property expected in a vessel is not all insured at one time or in one policy. But this makes no difference in the principle of settlement according to our law: although, according to the laws of most other countries, the policies take precedence of one another according to their dates, the whole short interest falling upon the policy or policies last effected. The foreign law, in this instance, appears to us the more equitable and reasonable of the two; and that our reason for thinking so may be intelligible, and thus gain assent or meet with refutation, we shall state a case of short interest upon a number of policies, such as not unfrequently appears. A merchant, A, orders his correspondent at Calcutta to ship for his account a quantity of sugar, not exceeding 1,000 tons, at a price not exceeding £200 per ton. In due time he receives a letter from his correspondent acknowledging the receipt of his order, and expressing confident hopes of being able to purchase the quantity, or the greater part of it, at the limits prescribed, and promising to advise as he proceeds. A, on receipt of this letter, say on the 1st of January, makes a provisional insurance for £50,000 upon sugar valued at £200 per ton.

Continuing without further advices, and fearing lest his correspondent's letter should have miscarried, and that he might have property afloat uninsured, on the 1st of February, 1st of March, and 1st of April, he effects similar insurances, thus covering the whole 1,000 tons. He subsequently receives advice that his correspondent had not been able to purchase more than half the quantity ordered, at his limit, and recovers from his insurers half the premium upon each policy. Now, it was not at all improbable that he might have received advice from his correspondent, as he expected, much sooner. And if he had received advice in the middle of February, of the shipment of 500 tons, and that the ship which contained them was totally lost in the river Hooghly, the insurers upon the two first policies would have been liable for a total loss. And it appears to us a defective arrangement, by which a party, who is at one time exposed to a total loss, should at another be compelled to return half his premium. It is true that the merchant may, if he please, insert in his policies a clause by which the policies shall be made to succeed one another; but we should say that the law, in insurance cases, as in the disposal of the property of deceased persons, ought to be the best general disposition, leaving to individuals the right of modification according to particular circumstances.

Return for Double Insurance.—Besides returns for short interest and over-insurance, there are returns for double insurance. They are, in fact, to all intents and purposes, the same thing. Double insurance exists where the party, through forgetfulness, makes an insurance upon his property twice over; or where the shippers and consignees of goods, when uncertain of one another's intentions, effect each an insurance upon them; or where the captain of a vessel in foreign parts, fearing lest his advices should not reach his owner, effects an insurance upon it, and the owner at the same time, acting with equal caution, effects one also. The observations already made upon returns for short interest, and upon the difference between our laws and those of other countries, apply with equal force here.

We have now gone over all the principal topics connected with marine assurance. Those who peruse this article with ordinary attention will, we hope, gain a tolerably clear insight into the principles and practice of the business. But a perfectly familiar acquaintance with it can only be acquired by those who are daily conversant with its details.

Analysis of the General Law of Insurance.—The invention of maritime insurance is due to Italy, and it came into use at the close of the 12th or the beginning of the 13th century. The term "policy" is derived from the Italian *Polizza*, which signifies any note or memorandum in writing, creating an evidence of a legal obligation. At that time the Italians were the carriers of Europe, and by their means insurance was introduced into other countries. A colony of Lombards was settled in London in the 13th century, and conducted for a long time almost exclusively the foreign trade of the kingdom; and it is to them that the tradition of England attributes the introduction of insurance. In the reign of Elizabeth a court was constituted to treat of causes relative to policies of insurance in a summary way. The court was formed of the judge of admiralty, the recorder of London, two doctors of civil law, two common lawyers, and eight merchants, empowering any five of them to hear and determine all such causes arising in London. But the court, on account of its restricted character and other causes, fell into disuse, and cases of insurance are now decided by trial in the courts of common law. The contract of insurance is essentially a contract of indemnity against the perils of the sea. The various codes differ in the objects prohibited to be insured. Thus the French code, ordinance of Bilbao, Spanish

code, Danish, Two Sicilies, Roman States, Ionian Islands, Lombardo-Veneto, Sardinia, Hayti, and Greece, prohibit insurance on freight of goods on board, excepted profits, wages of seamen, and maritime interest on loans on bottomry. While Great Britain, Holland, Portugal, Prussia, Malta, United States, and Hamburg, permit them. Re-insurance is prohibited in Great Britain. In Great Britain mariners are forbidden to insure their wages; but a captain of a ship can insure his wages, or any interest as part owner. An insurance on money lent to the captain, payable out of the freight, is illegal. So are wager policies; and it is the same in Massachusetts.

Article 335 of the French code authorizes the assurance on the whole or on a part of the objects which may be insured; but in Spain and Denmark the goods can not be insured for more than nine tenths of their value, and in Spain, no more than four fifths can be insured on the value of a ship; at Malta the insurance can not exceed seven eighths; in Prussia it may be made for the cost price, or for the value of the ship; but in Holland and in Portugal the entire value may be insured after the vessel has set sail. In Great Britain no policy can be made for a longer time than for 12 calendar months.

The duration of risks for a ship continues in Great Britain until 24 hours after she has moored at anchor in safety. The same in the United States and at Malta.

According to the Prussian code, payment ought to be effected within two months after the notice of the damages; after this time interest commences to run. The law of Great Britain being mostly similar to that of America, it has been thought necessary to vary the mode of treating the various subjects; so illegal insurance, rights of agents, concealment, and representations have been enlarged on in the law of America, while for these, as well as for all others, the reader is particularly referred to the law of Great Britain. The general spirit of the law of insurance is beautifully illustrated in the following language of the French jurists at the close of their report to the council of State on the title of insurance in the code of commerce, and rendered by Duer in his work on insurance: "Marine insurance may justly be deemed one of the noblest creations of human genius. From a lofty height it surveys and protects the commerce of the world. It scans the heavens; it consults the seasons; it interrogates the ocean; and, regardless of its terrors or caprice, defines its perils and circumscribes its storms. It extends its cares to every part of the habitable globe; studies the usage of every nation; explores every coast, sounds every harbor. To the science of politics it directs a sleepless attention; it enters the council of monarchs—watches the deliberations of statesmen—weighs their motives, and penetrates their designs. Founding on these vast materials its skillful calculations, secure of the result, it then addresses the hesitating merchant: 'Dismiss your anxiety and fears; these are misfortunes that humanity may deplore, but can not prevent or alleviate. Such are not the disasters you dread to encounter. Trust in me and they shall not reach you. Summon all your resources, put forth all your skill, and, with unflinching courage, pursue your adventures. Succeed—your riches are enlarged; fail—they shall not be diminished. My wealth shall supply your loss. Rely on me, and, for your sake, at my bidding, the arm of your enemies shall be paralyzed, and the dangers of the ocean cease to exist.' The merchant listens, obeys, and is rewarded. Thousands, tempted by his success, follow his example. Those whom it had long separated, the ocean now unites. The quarters of the world approach each other, and are bound by the permanent ties of mutual interest and mutual benefits."—LEVI'S *Com. Law of the World*.

We extract from Duer's *Marine Insurance* the following Law of Insurance in the United States:

"1. Insurance is a contract of indemnity against the perils of the sea. 2. A policy must specify, 1st, the parties between whom, and on whose account, the insurance is made; 2d, the consideration or premium paid; 3d, the subject insured; 4th, the amount insured; 5th, the risk insured against; and, lastly, the voyage or period of time during which the insurance is to continue in force. 3. Form and execution of the contract. The uniform and general practice of merchants may be considered as evidence of the legal necessity of a written contract. A specification of the risks is an essential part of the contract. 4. The policies used in the different States of the Union differ materially; and in New York the forms of the policy in use for the different subjects of insurance are distinct and separate. 5. The subscription of the insurer is alone sufficient. When the insurance is made by an incorporated company, the execution of the policy must be attested by the officers designated for that purpose by its charters or by its laws. 6. When a policy has in fact been executed, and notice of its execution has been given to the assured, its actual delivery is not essential to the completion of the contract. 7. The insurer, whether an individual or an incorporated company, would not be allowed to retract a consent thus confessed to have been given; but would be considered as holding the policy for the benefit of the assured, and bound to deliver it at his request. Should a loss occur, and the policy then be withheld from the assured, he would have a complete remedy in an action at law. 8. When an application for insurance is accepted by the insurer, the rate of premium and the date inserted, and the writing signed by the parties, it constitutes in equity a valid insurance, and in law a valid agreement to insure: it gives to the assured an immediate right, upon the tender of the premium, or premium note, to demand from the insurer the execution and delivery of the policy. The validity of an agreement to insure may be proved by the correspondence, but the evidence of the assent of both to all the terms proposed must be clear and unequivocal. 9. An offer to insure made by letter is a valid undertaking that the party will be bound by it, if in due season a favorable answer be returned. But although the insured is necessarily bound by his offer during the interval that has been stated, it must not be inferred that the applicant has the right, under all circumstances, to accept the offer when he receives it. 10. The policy, from the time of its execution, constitutes the sole evidence of the agreement of the parties; nor, subject to some exceptions, can any previous letters or communications between them, nor even the written application or agreement, be used to vary or control its interpretation. 11. When a policy refers to any other document or paper, the contents of the document or paper become a part of the contract as fully as if they were recited or incorporated in the policy. 12. A policy of insurance, when executed, may not only be cancelled by the consent of the parties, but is subject to any change or modification of its terms that they may choose to adopt. When an alteration is made in the body of the policy by the assured, without the assent of the underwriters, if it change the sense, or affect in any degree the substance of the contract, it renders the whole instrument void. 13. The date is one of the principal requisites in the policy. The date, however, is only presumptive, not conclusive, evidence of the facts that it attests. 14. Wager policies are established and admitted to be illegal.

Of the Construction of the Policy.—15. The construction of a policy, with the exception of cases in which parole evidence is admitted, is a question of law, the determination of which belongs exclusively to the court. As a contract of indemnity to the assured, the policy is to be liberally construed in his favor. An exception from the risks of the policy is to be construed strictly against the insurer. 16. When a discrepancy,

apparent or real, is found to exist between a written and a printed clause of the policy, it is the writing that controls the interpretation. 17. Extrinsic proof, by the testimony of witnesses or otherwise, is received to control or aid the interpretation, in order, 1st, to fix the application of general or indeterminate words; 2d, to correct an error of description, by showing the identity of the subject to which it relates; 3d, to remove a latent ambiguity; and, lastly, to explain the meaning of foreign or technical words. 18. Parole evidence shall never be received to show that the intention of the parties was directly opposite to that which their language expresses, or substantially different from any meaning that the words they have used, upon any construction, will admit or convey. Parole evidence may be admitted to show that particular words, upon the construction of which a controversy turns, have acquired, by the known usages of trade, a peculiar meaning, wholly distinct from their ordinary and popular sense. 19. When the interpretation of words, or the construction of a clause in the policy, that may be understood in a sense more or less extensive, has not been fixed by judicial decisions, parole evidence may be admitted to show whether they have obtained, by use and practice between the assurers and the assured, any, and what, known and definite import. The usage, if proved, will govern the construction. 20. If by a general practice, the voyage or trade to which the insurance relates has been pursued in a certain course or manner that the terms of the policy, in their ordinary interpretation, would not embrace parole evidence may be admitted to prove the existence of the usage. 21. A usage that can alone be allowed to control the interpretation of the policy, or vary the legal rights of the parties, must be general, uniform, notorious, reasonable, and consistent with the terms of the policy, and, to a certain extent, with the rules of law.

Of Illegal Insurances.—Breach of Municipal Laws.—

22. The invalidity of an insurance, as an implied violation of the laws of trade, may arise from the character of the goods exported or imported, the nature of the trade, or the breach of some statutory provision relative to the navigation of the ship or conduct of the voyage. 23. When the exportation or importation of the goods shipped is prohibited, the illegality affects not only the policy upon the goods themselves, but equally those upon the ship and freight, since the voluntary reception of the goods by the master is as much a violation of law as their shipment by the owner. When the prohibited act renders the subsequent voyage or trade illegal, it vacates the policy. 24. The illegality of a voyage, arising from the transportation of prohibited goods, is never permitted to affect a distinct policy upon the lawful goods of a different owner. 25. Where the goods insured by one policy are all of them lawful, the insurance is valid, even when the assured, as owner or otherwise, is interested or concerned in the transportation of unlawful goods by the same vessel, but otherwise when included in an entire policy. 26. The contract is entire when the goods insured (whether the insurance be general or specific) are included in one gross valuation; but where an insurance is specific upon different kinds of goods, and a separate value is affixed to each denomination, the contract is distinct. So where the policy is open upon different kinds of goods. 27. An insurance in one policy for the owners of a ship is not devisable; but the illegal act of one without the knowledge or privity of the others, has the same effect in voiding the entire contract as if all had concurred. But the contract will not be regarded as entire when the insurance is made by a common agent on account of several persons whose interests are several and distinct. 28. When an entire voyage is illegal at its inception, the illegality runs through and infects every part of it. 29. When a particular trade is prohibited by the express terms of a treaty to

which the State within whose jurisdiction the policy is effected is a party, the effect of the prohibition, whether general as to trade or limited to particular commodities, is precisely the same as if it were by a municipal law, an act of Parliament, or of Congress. Every voyage in contravention of the treaty is illegal, and every insurance upon such a voyage, whatever be the subject or terms of the policy, is necessarily void. 30. The defeat of the voyage by an embargo after the policy has attached, is not considered as a dissolution of the contract, but as a loss by a peril insured against, entitling the insured, upon an abandonment, to a recovery of the whole sum insured. 31. The contingent expectation of the parties that an existing law will be repealed interdicting a voyage or trade meant to be covered by the policy, is not sufficient to render the insurance valid when the expectation is not realized, and the voyage is undertaken and prosecuted in defiance of the provisions of the law.

Section II. Enemy's Property.—32. Every insurance upon property liable to confiscation as prize of war by the government of the country to which the insurance belongs, is of necessity invalid. An insurance made in a belligerent country upon the property of the subjects of an opposite belligerent, is void. 33. Goods in the course of transportation from a neutral country to a belligerent, if they are to be delivered to, and become the property of, a belligerent immediately on their arrival, are considered as his goods during the voyage (*in itinere*), and as such are subject to capture and confiscation.

Section III. Enemy's Property—Domicile.—34. A merchant is a political member of the country into which, by his residence and business, he is incorporated; he is a subject of the government that protects him in his pursuits, that his industry contributes to support, and of whose natural resources his own means are a constituent part. 35. When the property of a foreigner who, at the time of its shipment was living in a hostile country, is seized as that of an enemy, the captors are not bound to prove in the first instance that his place of residence was his actual domicile. The presumption of law is in their favor. The *animus manendi*, the intention to remain, the law imputes to him, and to redeem his property from the noxious imputation, he must give such evidence of his intention and plans as shall be effectual to destroy it. 36. The national character of persons who reside in a foreign country, in a public or representative capacity, is not changed or affected by their residence, whatever may be its duration, or by whatever circumstances indicative of the intent to render it permanent it may be accompanied. But if a foreign consul engage in commerce, he is immediately stamped, with respect to that commerce, with the national character of the country in which he resides, and from which his trade is conducted. His character of consul affords no protection to his mercantile adventures. 37. A native subject can not acquire a foreign domicile by an emigration from his own country during the existence of hostilities (*flagrante bello*) so as to protect his trade during the war, either against the belligerent claims of his own country or against those of a hostile power. His native character is wholly unchanged by his change of residence. 38. The nature of the traffic or business in which an individual is engaged, may stamp upon him a national character wholly independent of that which his place of residence would alone impose.

Section IV. Trade with the Enemy.—39. The property of a subject is in all cases liable to confiscation in a court of prize when it is found engaged in an unlawful trade or intercourse with the ports, territories, or subjects of the public enemy; and the property of a subject of a State allied in the war is liable under the like circumstances to the same penalty. 40. To render the importation of goods from an enemy's port an illegal trading, it is not requisite that they should be

the fruits of any purchase, barter, contract, or negotiation in the enemy's country, after hostility had commenced. The sailing of the vessel with the goods on board after the party had knowledge of the war, completes the offense, stamps the cargo with an illegal character, and subjects it, during its transportation, to a rightful seizure. 41. To render a trade with the enemy unlawful, it is not necessary that the communication with the enemy's country should be immediate and direct. A circuitous trade is liable to the same abuses, and involves the same political dangers as a direct one, and therefore equally falls within the interdiction and penalty of the law. 42. If an American vessel, during a war, even when destined to a neutral port, prosecutes her voyage under a license from the government of the enemy, both ship and cargo, while they remain under the protection of the license, are liable to capture, and if captured, are lawful subjects of confiscation. 43. A license granted by the sovereign power is not subject to transfer or assignment, but its legitimate use is confined to those for whose benefit it was originally granted. A license to an alien enemy, whether by name or general words, removes all his personal disabilities. 44. The goods for which the protection of a license is claimed, must correspond with those that the license enumerates or describes. When a license authorizes the importation of goods from an enemy's country in an enemy's ship, the protection intended to be granted, although confined in terms to the goods, by the just construction of the law is extended to the vessel. The national character of the ship, as described in the license, is, in most cases, a condition necessary to be fulfilled to secure the protection that is desired.

Section V. Breach of Neutrality.—45. The duties of a subject or citizen of the neutral State are, 1. To abstain from every act that tends to the assistance of either of the belligerents in the prosecution of the war. 2. To abstain from every act that tends directly to relieve one of the belligerents from the pressure and effect of the opposite hostilities. 3. To offer no resistance to the full exercise of the belligerents' rights of visitation and search, and to resort to no means for eluding and defrauding the rights of capture. 46. From the moment that a ship, with contraband articles on board, quits her port on a hostile destination, as a general rule the offense is complete and the capture legal. To justify the capture, it is enough that the immediate object of the voyage is to supply the enemy, and that the contraband is certainly destined to his immediate use. 47. Articles of contraband are all the munitions and instruments of war; all manufactured articles that in their actual state are fitted for military and naval use, and more especially for the building and equipping of ships of war. Pitch, tar, and hemp are contraband; but they enjoy exemptions if directed to a mercantile port. Provisions are not contraband, but they may be rendered so by their special destination and intended use. 48. An insurance upon goods liable to confiscation as contraband of war—if made in the belligerent country whose rights are violated—is wholly void. 49. A blockade is a naval circumvallation intended to prevent and cut off all communication with the port that it incloses, and to cause an entire suspension of its commerce. The breach of a blockade subjects all the property so employed to confiscation by the belligerent power whose rights are violated.

Of the Parties to the Contract—Of the Legal Competency of the Parties.—50. All persons of full age and otherwise capable of contracting, have the right to insure and be insured. 51. In order to render a party capable of insuring, it is not necessary that he should have any interest in the property insured at the time the insurance is effected, unless the risks as described in the policy have already commenced. When the contract is perspective, it is valid and effectual if the

interest meant to be covered exists when the policy attaches. When a party effects an insurance after the risks have commenced, if he has an interest at the time in the subject-matter of the policy, the contract may be so framed as to entitle him to recover for a loss that had in fact occurred before his own title was acquired by insuring the goods "lost or not lost." 52. An agent employed to procure an insurance can not himself become the insurer.

Of the Description of the Parties in the Policy.—53. The names of the immediate parties to the contract, that is, of the individual or company agreeing to assume the risks, and of the person effecting the insurance, must be mentioned in the policy. 54. When the insurance is made by an agent, the parties really assured may be described by general words; nor is even a general description necessary, if the party effecting the insurance describes himself as "agent" in the policy. Where the person effecting the insurance describes himself as the agent of a particular person, the policy, by its necessary construction, insures only to protect an interest of the party thus named as the principal. 55. When an agent effects a policy in his own name on account of a third person, who is named, or describing the assured by general words, an action on the policy for the recovery of a loss may be maintained in the name of the agent, or in that of the party really interested. But where the agent is a naked trustee, having no lien in the policy, and no interest of his own that was meant to be protected, he will not be allowed to maintain the action in his own name, if it appear that previous to the commencement of the suit his authority as agent had been countermanded or revoked. 56. Although each partner has a right to insure the partnership property in the name or on account of the firm, yet where the insurance is expressed to be on his sole account, it must be limited in its application to his individual share. When the separate interest of a partner, separately insuring, is equal to the amount insured, he can have no motive for averring or attempting to prove a partnership property. 57. When the interest of the party in whom the interest is averred is proved, and an authority from him to insure, or his adoption of the contract is also proved, it is an inference of law from the terms of his policy that the insurance was effected on his account. But when the proof establishes that his interest was not intended to be covered, it forms an insuperable bar to a recovery. 58. The interpretation of every policy that is effected by an agent under previous instructions, must be controlled by the intention of the principal in every case where evidence of the intention can properly be received to determine the construction. The general words of a policy describing the assured, have always received a liberal interpretation. 59. The policy may be so framed that the insurance shall be inseparably attached to the property meant to be covered, so that the successive owners, during the continuance of the risks, shall become in turn the parties really assured.

Of the Assignment of the Policy and of the Rights of the Assignee.—60. Although a policy of insurance in its usual form is not assignable in law so as to enable the assignee to maintain an action upon the contract in his own name, it is in all cases assignable in equity, and vests in the assignee a beneficial interest, varying in its extent according to the purpose for which the assignment is made. 61. Although the rights of the assignee of a policy are equitable in their nature, it is not in a court of equity, when a loss has occurred to which he claims to be entitled, and the underwriters refuse to pay, that he must seek relief. He has a full remedy in an action at law, in the name of the assurer. 62. The assignment in writing of a policy of insurance does not vest in the assignee a perfect title, except as against the assignor, unless it is accompanied by an actual delivery of the instrument itself. The

policies in use in Boston contain special clauses restricting their assignment.

Of Insurance effected by an Agent.—*Of the Authority of an Agent to Insure.*—63. The necessity of proving either the original authority of the agent, or the subsequent adoption of his contract, is expressly affirmed, or necessarily implied, in every case in which a question as to the authority of the agent has arisen. A prior authority conferring on the agent the right to insure, is either express or implied. An express authority may be written or verbal. 64. The authority of a single partner, and of each partner, to insure the partnership property in the name or by general words on account of the firm, or to direct such an assurance to be made, is established and undoubted. 65. The right of a part owner to insure is limited to his own individual share. 66. The master of a ship has no general authority, but has an implied authority in special cases. 67. When a consignee has an interest, he may insure the entire property consigned to him; but a consignee who has no interest, and no lien whatever, upon the goods consigned to him for sale, has no right to insure them on behalf of the consignor, unless specially instructed. 68. A general agent may insure on behalf of his principal, unless restricted in his discretion by the express instruction of his principal. The authority of the agent, express or implied, may be revoked by the principal at any time before the terms of the insurance have been settled by an agreement with the underwriters. 69. In the United States a usage prevails to cover all shipments by a general standing time policy on goods, so as to embrace not only all outward and home shipments made on their own account, but all shipments made to them from foreign ports, upon which they are directed to effect insurance. When there is a subsisting policy in the above form, a direction to insure, once given, is in its nature irrevocable. 70. When an agent accepts an order to insure, or omits to give notice of his refusal, he is of course bound to its execution. When the principal has funds or effects in the hands of his correspondent, the application of which rests in his own discretion, he is justified that they will be applied by his correspondent to procure the insurance that he directs. 71. When the agent has no funds or effects of his principal on hand, but, by an established course of dealing, has been in the habit of executing the orders of his principal to effect insurance, and of advancing the premium, he is bound to execute all similar orders that he may receive from him, until he has given him notice that this course of dealing must be discontinued. 72. When a consignee receives a bill of lading, with an order to insure its contents, if he accepts the consignment, he must execute the order. The law regards the transaction as entire, and the acceptance of the benefit as a tacit promise to discharge the duty. 73. These rules are subject to exceptions. The agent can never be bound to effect an insurance that, from circumstances that could not have been known or anticipated when the order was given, instead of securing an indemnity to his principal, would tend to his certain prejudice and loss. When the agent, when he receives the order, knows, or has just grounds for believing that his correspondent is insolvent, or is threatened with insolvency, the acceptance of the trust rests in his own discretion. Yet, should his apprehension prove to be groundless, he should be called to justify his conduct, by proving that the information on which he has acted was credible and trustworthy. The obligation to insure that arises from a previous course of dealing, can only apply to insurances similar to those that the agent had been in the habit of effecting. 74. The confidence reposed in an agent is strictly personal; and he can not delegate to a third person an authority that, by the intention of his principal, was meant to be executed by himself alone.

SECTION III.—Of Insurances by voluntary Agents, and their Adoption.—75. Although the adoption of a voluntary insurance is necessary to render the contract valid against the principal, and proof of its adoption to warrant the recovery of a loss against the insurer, we are not to infer that the agent who effects the policy is at liberty to rescind his own contract, upon proof either of his want of a previous authority, or of the refusal of his intended principals to ratify his act. 76. There are, however, two cases in which, as exceptions from the general rule, the voluntary agent, when his insurance has been rejected, may justly claim to recover back the premium he has paid: 1st. When he discloses to the underwriters that the insurance is made without authority, and they agree that it shall be cancelled, if not adopted; and 2dly: Where the insurance is rejected for reasons that would have rendered the contract valid, if adopted. 77. The contract of the voluntary agent may be ratified and appropriated by the principal, even with knowledge of a loss, unless the power to adopt the insurance under these circumstances, is excluded by the express provisions of the policy. When an abandonment of the property insured is necessary to justify a claim for a total loss, an adoption of the contract, with the right to enforce the claim, is of necessity limited to the period within which, either by the provisions of the policy or by the general rule of law, the abandonment must be made to render it valid; and a claim for partial loss is just as liable to be barred by the lapse of time, as if it arose under a policy duly authorized. The party for whom the insurance was intended can have no right to adopt and enforce a contract that would not have been valid if made by his express direction. 78. When the agent merely exceeds a given authority, the principal is concluded if he fail to give notice of his dissent within a reasonable time after receiving the information.

Of the Duties of Agents in their Relations with their Principals, and with the Insurers.—79. Every agent who is entitled to receive a compensation for his services, is bound to exercise not only the same care and diligence that he is accustomed to employ in his own private affairs, but all the care, and diligence, and skill that the transaction of the particular business with which he is intrusted, according to its nature, may be reasonably construed to require. 80. A person who undertakes to effect an insurance for another, should make proper inquiries as to the circumstances and standing of the insurers to whom he wishes to apply, and to be careful to select those whose credit is established and undisputed; but when he acts in good faith in making the selection, and has exercised the necessary caution, he is not, generally speaking, responsible for the ultimate solvency of those who subscribe that policy, unless he receives a *del credere* commission. From this rule the voluntary agent is not exempted. 81. When the agent employs a broker to effect the policy, as he is always justified in doing, when such is the usage of the place where the contract is made, it is to the discretion of the broker that the choice of the insurers is intrusted; and for his fraud or neglect in the execution of this trust, the agent is not responsible where no want of good faith, or of proper diligence, is justly imputable to him. 82. An agent who has effected a policy in conformity to the orders of his principal, has the power when the first insurer becomes insolvent, even of rescinding the contract when the interests of his principal plainly demand the measure, so long as the policy remains in his hands. But the agent ought never to cancel a subsisting policy when the partial security that it affords is preferable to a return of the premium, unless with the certainty that he will be able to pay a new contract fully, to protect the interest of his principal. The subsisting policy being rescinded, if the order was special and limited, he will still be bound to follow its

provisions and observe its limits; but if within its limits, and according to its terms, it is the duty of the agent to effect a second insurance. 83. Where an increased premium is demanded, the execution of the order can no longer be regarded as a positive duty, but will rest in the sound discretion of the agent. Where, from the lapse of time, or other circumstances, the alteration of the risk is so material that the premium demanded is much larger than the principal when he gave the order to insure could have contemplated as necessary to be paid, the agent may be partly excused who declines to exercise his authority; and, on the other hand, whatever may be the change in the risk, and the increase of the premium, if there are reasonable grounds to believe that a second insurance will tend to the advantage of the principal, the agent, proceeding in good faith to effect it, will be protected. 84. It is the duty of every agent to communicate to the underwriters all the facts and circumstances of which he has any knowledge or information; to represent truly all the facts he discloses, and to answer truly all the proper inquiries of the insurer; for the concealment or misrepresentation of the agent, whether intentional or undesigned, has the same effect on the validity of the contract as that of the party really assured. 85. Although an agent to whom no fraud or neglect is imputable, is not responsible for the concealment and misrepresentation of the sub-agent whom he is authorized to employ, yet when he employs a broker to effect the policy, he is bound to give him all the necessary instructions and all material information that he himself possesses, and this duty attaches even on an agent who acts gratuitously, who may be rendered liable for the damages resulting from his omissions. 86. When the omission or act of the agent that vitiates the contract can be justly imputed to his fraud or his neglect, he is personally liable for the resulting damage; but where it proceeds from his want of the requisite skill, there are cases in which equity demands some distinctions. 87. A mercantile agent who was neither authorized to insure nor has effected an insurance, may yet render himself liable as an insurer, by a false representation, not to the underwriter, but to his principal, if the nature of the misrepresentation is such as to invalidate a policy founded on it, effected by the principal, or on his behalf. The most important and responsible duty of every agent in effecting an insurance, is to take care that the policy shall be so framed as effectually to cover the property and risks, which he is directed to insure, or which, when not acting under a previous order, he believes and represents himself to have insured. 88. When an agent acts under clear and positive instructions, and violates them in the term and form of the insurance that he effects, his negligence, it is manifest, is still more culpable and renders the agent personally liable. But when the order is plain, the good faith of the agent will protect him. 89. Even when an agent acts gratuitously, without the hope or expectation of a reward, yet, if he enters on the execution of an order to insure, he must follow its terms, and by his omission to cover all the property or risks that he is directed to insure, will become responsible for a loss that the insurance of property effected would have embraced. The mistake of the agent where the practice is unsettled and the law uncertain, affords no evidence of the want of reasonable skill and ordinary diligence, for which, alone, he is responsible. 90. The agent is not responsible if his mistake arose not from his want of requisite diligence and skill, but from the imperfect and confused manner in which the instructions of his principal were expressed. 91. All prior verbal communications are superseded by the written instructions which constitute the proper and sole evidence of the intentions of the party directing the insurances. 92. If the agent

finds it impracticable to effect an insurance according to the terms of his instructions it is his duty to give immediate notice of his failure to his principal. When an agent has separate orders to insure on the same voyage, and against the same risks, the property of several persons whose interests are several, should he elect to cover the whole property in one policy, he must be careful so to frame the contract as to secure to each of his constituents the same indemnity to which he would have been entitled had his property and interest alone been covered. 93. An order to insure is either discretionary or positive, and when positive, is either general or limited. The order is discretionary when the election to insure or not to insure, is committed absolutely to the discretion of the agent; and in such a case if the agent determines not to insure he is responsible only for his good faith. The order when positive is general when it describes the property and voyage, but gives no direction as to the risks to be covered and imposes no limitation as to the premium. When the order is thus general the duty of the agent is fully discharged by his obtaining an insurance in the usual form of the policy at the place where the insurance is made. 94. When the order to insure contains no direction or restriction as to the amount of the premium to be paid, it is the duty of the agent to effect the insurance at all events without regard to the premium; and if by limiting himself to a smaller premium he defeats an insurance, he is liable, with the exception, however, that where the funds he has or he is to advance should not permit him to enhance the premium sufficiently, he would be excused. 95. Special instructions must be exactly followed by the agent. When an agent is directed to insure a certain amount, it is his duty to procure an insurance, if possible, to the full extent of the sum required; but if he can not, he must execute the order as far as he can. 96. An insurance is not wholly void when the agent exceeds the premium to which he was limited. A contract made by an agent who in its terms exceeds his authority, is never wholly void if the excess may be readily ascertained and separated. 97. As a general rule the order unless otherwise expressed, may be construed as intended to refer in its execution solely to the place of the agent's residence; but circumstances may doubtless create an exception and impose a duty that the order does not in terms require. 98. Where an agent who has effected a policy retains its possession with the consent of his principal, his agency is continued. His general duty is to enforce the rights and protect the interests of his principal in all matters arising out of the contract. If a loss, partial or total, has occurred he must collect, arrange, and submit the necessary proofs, adjust and settle its amounts, demand and receive its payment. If in order to sustain the claim of the assured for a total loss, an abandonment is necessary, he must take it on behalf of his principal, must take care that it is properly expressed and is delivered in due season, and he must be careful to preserve the requisite evidence of all his transactions. 99. The most important and responsible of the subsequent duties of the agent is to collect, receive, and pay over the losses that may occur and fall due under the policy, and by his negligence in the discharge of his duty he may readily incur a heavy liability since he is necessarily bound to pay all losses, that but for his neglect and delay might have been recovered from the underwriters. Payment to the agent to discharge the underwriters must be an actual payment made in good faith, not the allowances of a credit. 100. An insurance agent or broker who is authorized to receive a loss, has no authority to accept a credit in lieu of a payment in money, nor can the underwriter in such a case allege his own ignorance of the trust that is violated. When the agent is a creditor of the assured and the nature of his debt gives him a lien on the policy, that lien will attach on all

moneys that he may receive from the underwriter under the policy, and he has a perfect right to retain such moneys to his own use so far as may be necessary to satisfy his claims, by giving due credit to the assured for the amount. The credit given by the agent extinguishes the debt to the assured, and discharges the insurer. 101. A settlement on account between the underwriter and the agent is conclusive on the agent himself. 102. The agent should transmit to his principal, full and just accounts of all his transactions on his behalf, keep him advised of all occurrences, connected with the insurance by which his interests may be affected, and deliver over to his principal, on request, the policy effected on his behalf, provided his own claims, if such as give him a lien on instrument, are first satisfied. The policy is in all cases the property of the party really assured. He may maintain an action of trover for its recovery, not only against his agents, but against every person into whose hands it may have passed, and by whom in violation of his rights it may be withheld. 103. In the United States it is not unusual to insert a provision in the policy by which all losses are made payable only to the person in whose name the insurance is effected. 104. If the agent intends by the insertion of the special clause to extend his lien so as to cover advances or a balance of accounts, to which the privilege is not annexed by law, the extension, if not authorized by the principal, is a fraud upon his rights; and where no such intention exists a provision limiting the payment of a loss to the agent alone may operate to embarrass or delay the remedy of the assured, and should therefore, without his consent, never be inserted.

Of the Rights of the Agent.—105. An agent has a lien on the policy; and moreover, has authority to maintain an action in his own name for the recovery of a loss under the policy. 106. An insurance broker has a lien on the policy against his immediate employer, not only for his commissions and premiums, but for the general balance of his insurance account. If the broker, when he effected the policy knew, or had reasonable ground to believe, that the insurance was on the account of a third person, his lien as against the party really assured, will be confined to the premium and his commission in the particular transaction. 107. A broker who has received moneys under a policy that he effected in ignorance that his employer was an agent, is liable to the party really assured. 108. A mercantile agent has a lien on the policy that he is directed to effect, not only to the premium and his commission in the particular transaction, or extended only to advances made by him on account of the property assured, but also to the general balance due to him, or becoming due while the policy is in his hands in his account with his principal. The privilege of lien embracing claims arising from other distinct transactions does not extend to the necessary, the voluntary or the gratuitous agent. A general lien is not limited to moneys actually paid by the agent or then due to him, but embraces all his outstanding liabilities on behalf of his principal arising out of his agency. 109. But a general lien, unless by a special agreement, does not embrace all the existing demands and liabilities of the agent against his principal, but only such as relate to the business or employment in which the agent is engaged, and have grown out of the relation in that employment between him and his principal. 110. The obligation of the lien attaches equally on all moneys received by him under the policy. The agent waives his lien when he voluntarily delivers the policy to his principal or to his order, or when he parts with the possession wrongfully, as by pledging the policy as his own property. So he may waive his lien by an express or implied agreement. When the policy comes again into his possession, his lien is revived in all its original extent. The lien of a mercantile agent attaches on the policy in the possession of the broker

whom he had employed to effect the insurance. 111. The Revised Statutes of New York limit the right of set-off to a defendant to whom the demand proposed to be set off is due in his own right, either as the original creditor and payee or as the assignee and owner, and the provision, if literally and strictly construed, would exclude a set-off by an agent in any case whatever. The courts, however, may adopt as a reasonable construction, that an agent who in his own name is a party to the contract, and has a lien on the policy and its proceeds, is to be considered as an original creditor, or, in judgment of law, as the assignee and owner of the demand. So long as the premium-note remains in the hand of the underwriter, a return premium on the same policy is its necessary appendage; where the return is entire, it extinguishes the note; where it is partial, it operates pro tanto as a satisfaction.

Of the Extent of the Liability of the Agent.—112. The liability of the agent is simply to make good to his principal the actual damage that the specific breach of duty with which he is charged has directly occasioned. The liability of an agent arising from the insolvency of an underwriter from whom a loss was due that he might have collected, is probably of the same nature as that of an agent under a *del credere* commission not immediate, but secondary. 113. The first remedy of the principal is against the estate of the bankrupt, and the agent is answerable only for the sum that the estate may be deficient to satisfy. And when an agent has received the amount of a loss, he is not permitted to dispute the title of his principal, his duty is to pay over the moneys he receives. 114. To fix the liability of the agent an actual damage resulting to his principal, must be proved. Where an agent, from his neglect to insure, has rendered himself liable as an insurer, he is entitled to avail himself of every defense which, had the necessary insurance been made, might have been urged by the underwriters themselves. 115. The liability of the agent is not in all cases determined, even where it appears that the principal had parted with all his interest in the subject to be insured previous to the happening of the loss. The liability of an agent is not in all cases to be limited to the sum that his principal would have been entitled to claim as an indemnity from the underwriters had an insurance been properly effected. Where the principal has been defeated in an action against the underwriters on the policy, owing to the breach of duty of the agent, the costs and expenses are chargeable to the agent. 116. An agent acting under a *del credere* commission is liable only as a surety for the ultimate solvency of the party with whom he contracts for his principal. A *del credere* agent has no immediate remedy against the underwriter. When the policy is effected in the name of the *del credere* agent, he may maintain an action in his own name on the policy itself, but not when his own name is not on the face of the policy. A *del credere* commission is not within the statute of frauds. See *DEL CREDERE*.

Of Insurances by an Agent of the Underwriters.—117. The authority of the agent to sign a policy may be proved by his habit of subscribing policies on behalf of the defendant, although such proof is incomplete unless it embraces some positive act of the defendant amounting to a recognition of the authority. Where the agent subscribes the policy in his own name and omits that of his principal, he becomes responsible. 118. An agent whose original authority to sign the policy as such has been proved or admitted, has an implied authority to perform every subsequent act on behalf of his principal; and this implied authority extends to the adjustment of a loss, the acceptance of an abandonment, and the payment of a loss. An insurance broker is not the agent of the underwriter to admit or to pay a loss; and if such a payment is made by him, it is regarded as purely voluntary.

119. Agents of insurance companies in the United States are usually intrusted with an authority not merely to transmit applications, but, under certain restrictions, to perfect insurances in the name and on the behalf of their constituents. If the restrictions to which the agent is subject in the exercise of his authority are private and confidential in their nature, their existence as between the principal and his agent is not permitted to be alleged. So far as the rights of third persons are concerned, unless disclosed, they are inoperative and void. The ostensible or apparent authority of a general agent is his real authority in respect to all who deal with him in ignorance and good faith. It is the custom of the underwriters at Lloyd's and of the principal insurance companies in the United States, to appoint agents in nearly all the ports of the world, but the powers of these agents are circumscribed by very narrow limits. They can not bind their employers by any positive act so as to create a liability to the assured that would not otherwise exist, nor are the acts which they are authorized to perform of such a nature as to mislead the public as to the real extent of their authority. When a question arises as to the validity of their acts, it is solely by a reference to their written instructions that it must be determined.

Of Concealment.—120. Each is bound to communicate to the other all facts within his personal knowledge that tend to show the true character and value of the risks that are meant to be covered, and each, in his own communication to the other, is bound to state the exact and the whole truth in relation to the facts that he represents, or, upon inquiry, discloses. A misrepresentation or concealment of material facts, whether it resulted from design or from ignorance, mistake or inadvertence, vitiates that mutual consent essential to its validity. 121. The materiality of facts concealed or misrepresented is not to be determined by the event, but results solely from their probable influence on the estimated value of the risks at the time they were assured. The question is not whether the loss that is claimed is attributable in any degree to the risks that were concealed, but whether, had the facts been known, the underwriter would have subscribed the policy or would have limited himself to the premium that he received. The obligation of a frank and full disclosure attaches equally upon both the parties, the underwriter as well as the assured.

Facts that the Assured is bound to disclose.—122. It is the duty of the assured to communicate all facts that are material to the risks, and which are not known, or presumed to be known, to the underwriter. The assured is bound to disclose all the intelligence that he has received, and all the information that he possesses, that relate to facts which are material to the risks, although the information may be of a doubtful character, and may ultimately prove to be untrue. 123. So if the intelligence received by the assured relates not to a fact, but to mere expectation or belief of the person from whom it was received, if the expectation refers to an event that, had it occurred, would be material to the risks, it must be communicated; nor will the suppression be excused by evidence that the expectation, although entertained and expressed in good faith, was not realized in the event. When it is certain, however, that the assured acted with an entire good faith, circumstances not disclosed by him are not to be deemed material simply on the ground that if communicated they might have excited a suspicion of danger in the mind of the insurer. 124. The assured will not be allowed to protect himself against the charge of an undue concealment by evidence that he had disclosed to the underwriter, in general terms, the information that he possessed. Where his own information is specific, it must be communicated in the terms in which it was received. The information possessed by the assured may not be material in itself,

separately considered, yet may be of such a character that it would probably lead to further inquiries on the part of the underwriter; and if the result of the inquiry would show the information to be material, it must be communicated. Its concealment, whether fraudulent or innocent, will vitiate the insurance. 125. When the insurance is "on ship or ships," omission to disclose the name will not avoid the policy unless the concealment was rendered material by other facts. The voluntary ignorance of the assured, whether the result of fraud or of gross negligence, will not be allowed to excuse him, but as evidence of a concealment vitiating the policy, will have the same effect as his actual knowledge. 126. Where the assured employs an agent to effect the policy, it is his duty to communicate through him all the facts that are requisite to be disclosed. The duty of the principal is the same whether the authority of the agent be general or special. The concealment of a loss by an agent who is bound to give the intelligence, violates the implied understanding on which the contract is founded, as a similar concealment by the principal. Concealment of material facts when the policy is altered, renders the policy void. 127. Where an underwriter seeks to protect himself by a re-assurance, he is bound to communicate not only all the representations made to himself when he subscribed the policy, but all the knowledge and information he had subsequently acquired. In England and in the United States the knowledge of the assured, or of his agent, is never presumed, but must be established, in all cases, by positive evidence. 128. The information usually necessary to be given, may be distributed under the following general heads: 1. The state and condition of the ship or property insured. 2. The nature and extent of the interest insured; and, lastly, the extraordinary perils arising from extreme causes to which the property has been or will probably be exposed. The assured is not bound, in the first instance, to make any representation as to the condition of the ship at the commencement of the risks to which the policy relates. 129. Although not by the terms of the contract, yet in judgment of the law, stipulates that the vessel was or shall be seaworthy, and it is on the truth of this implied stipulation, and not of any representation of the assured, that the underwriter relies, and the policy is founded. Hence, a policy, where the ship is unseaworthy, and the fact is known to, and suppressed by the assured, is conclusive evidence of a meditated fraud. The same disclosures must be made by the assured if any facts are known to him which would justify a reasonable suspicion of the honesty of the master. As the warranty of seaworthiness relates solely to the condition of the ship at the commencement of the risks that are covered by the policy, if the assured has received any advices relating to the state and condition of the ship since the commencement of the voyage insured, he is bound to communicate them. 130. Condition and quality of the goods. When no inquiry is made by the underwriter, the assured is not bound to disclose the state and condition of the goods when shipped, nor where the insurance is on goods generally, is he bound to disclose, in the first instance, the particular character and description of the goods that are meant to be covered. Goods lashed on deck are not at the risk of the underwriter. Whether they were insured in special or general terms, they are not protected unless the fact that they are thus transported is stated in the policy, or unless the mode of transporting is sanctioned by a usage of trade, the existence of which the underwriter is bound to know. When goods laden, or to be laden, are insured in a time policy, such a disclosure is not necessary to be made. The same when the insurance is on successive cargoes on a trading voyage to successive ports, the choice of the port at the discretion of the assured.

Title or Interest of the Assured.—131. The assured is not bound to communicate to the underwriters the particular nature of his interest in the property insured; but in some cases, as when the insurance is on freight, bottomry, respondentia, etc., the nature of his interest must be specified in the policy, and in others, its disclosure to the underwriter is necessary, in order that the terms of the policy may be construed to embrace it. The decisions on this subject in the American courts are very conflicting. 132. When letter-marques are intended to be used, although for the limited purpose of chasing and capturing vessels that may be met in the course of the voyage, it must be disclosed. 133. Information of the fact, or of the day of sailing, although known to the assured, is not in all cases to be given to the insurer. When the ship is known to have performed a part of the voyage insured, she may not be out of time when the policy is effected in reference to the whole voyage, yet may be so in reference to the accomplished portion; and, in such a case, it is the duty of the assured to communicate not merely the original time of sailing, but all the information he had received relative to the course and progress of the voyage. 134. However material may be the facts known to the assured, it is plainly unnecessary to communicate them to the insurer, if they are in fact already known to him. Proof, therefore, of the actual knowledge of the underwriter is in all cases a complete answer to a charge of concealment. The assured is not bound to make any communication in the first instance respecting facts which the underwriter ought to know, and of which, for this reason, the law imputes to him the actual knowledge. The presumption of law in the cases comprehended in this rule, is conclusive and absolute. The insurer is bound to know all the general causes that are open to his inquiry, that may by their operation affect either the political or natural perils that are intended to be covered by the policy. 135. The political perils usually covered by the policy, are the risks of capture, seizure, and detention; therefore the assurer is bound to know the general and public facts upon which a loss arising from such risks may occur. 136. The natural perils of a policy are such as wholly arise from physical causes, and in a limited, but not in an unusual sense of the words, are aptly denominated "perils of the sea," or "sea risks." The underwriter is bound to know all the general causes by which they may be occasioned, increased, or varied. The usages of trade are equally presumed to be known to the underwriter. In all these cases the presumption of knowledge attaches equally upon both parties. 137. To fix the presumption of knowledge upon the underwriters, it is the duty of the assured to communicate all the circumstances within his personal knowledge that are necessary to be known to enable the underwriter to apply the presumption to the particular risks that are meant to be covered. The assured is not bound to communicate material facts if the underwriter expressly or impliedly waives the information. 138. Where, from the facts communicated to the underwriter, he is bound to infer the existence of other facts not disclosed, his omission to make the inquiry is an implied waiver of a more explicit disclosure. The underwriter, by the nature and terms of the contract, may waive all special information as to the actual and probable existence of the particular risk that he agrees to assume. When he thus consents to assume the risk in its most aggravated form, he can not justly complain that facts showing that such was its real extent were not disclosed to him. 139. The assured is not bound in the first instance to communicate any facts that are covered by a warranty express or implied. He is not bound in the first instance to communicate facts that are only material, as showing the existence of a risk which is excepted from the policy. He is not bound to communicate facts that tend to diminish the risks

as they would otherwise be understood by the insurer. 140. The insurer has the right, upon inquiry, to be informed of all facts within the knowledge of the assured, that in the exercise of his own judgment he may deem material to the risks, or important to be known, as a guide to his own discretion. Where the insurer is not to be charged with an equal knowledge, the assured, either without, or upon inquiry, is bound to communicate all the facts, that his knowledge or information embraces, that are material to the risks, or may be deemed material by the insurer, but he is not bound to communicate his own conclusions from the facts that he must disclose. 141. The following are cases in which the effect of a concealment is not to vitiate the entire contract, but merely to exonerate the insurer from a loss resulting from the risk concealed: 1st. National character of the insured. 2d. Liability of the property insured to capture and detention. 3d. Liability to seizure from breach of foreign laws of trade. 4th. Want of necessary documents. 5th and lastly, the use of false or simulated papers.

National Character of the Assured.—142. Where the insurance is made in a neutral country; a full disclosure of the national character of the assured in the first instance is necessary, not to give validity to the contract, but to cover the risk, so as to charge the underwriter with a resulting loss. The assured may be the subject of a neutral State, and legal owner of the property insured, yet, an equitable interest, rendering the property liable to hostile capture, may be vested in a belligerent subject. As such an interest creates a risk not contemplated by the parties, it must be disclosed. 143. Even when the policy contains a warranty of neutrality, and describes the assured by general words, facts not disproving the warranty, yet showing that the property is liable to seizure as enemy's property, are necessary to be disclosed. 144. Liability of property to capture or detention: The voyage or trade to which the insurance relates may be interdicted by the law of nations, by the special provisions of a treaty, or by an unjust ordinance or decree of the belligerent power, or by arbitrary rules or decisions that prevail in the courts of prize. 145. Where the voyage or trade on which the insurance relates, is prohibited by the municipal laws of the foreign country to which the ship is destined, or where the risks are to commence, a concealment of such an extraordinary risk discharges the insurer from a consequent loss, without affecting in other respects the validity of the contract. 146. The rules that determine the validity of an insurance, embracing the risks of an illicit trade, or trade in violation of the municipal laws of a foreign country, are substantially the same as in respect to an insurance on goods contraband of war.

Of Representations.—147. A representation is a statement of facts, circumstances, or information tending to increase or diminish the risks, as they would otherwise be considered made, prior to the execution of the policy by the assured or his agent, to the insurer, in order to guide his judgment in forming a just estimate of the risks he is desired to assume. It is usually made by parole, or by a writing not inserted in the policy; but when the intention as to the construction is sufficiently declared, may be expressed in the policy. 148. Representations relate either, 1st, to facts; 2d, to the information; or, lastly, to the intentions, expectations, or beliefs of the assured. A representation of facts is a positive representation, which is divided into affirmative and promissory: when affirmative, they assert the past or present existence of the facts to which they relate; when promissory, that the specified event will happen, or act be performed. 149. The evidence of a positive representation of facts, may properly be received in all cases. The rules of evidence in respect to the admissibility of a representation, are substantially the same as in respect to a

usage; and, in many cases, the representation, when proved, becomes, like the usage, a part of the contract. The words of the representation are to be strictly and literally construed, but are to be understood in their plain and obvious meaning, in that which it is most probable they were suggested to the mind of the insurer. It will be construed to embrace all the facts, the existence of which, from the terms used, would reasonably and probably be inferred. 150. When a representation is so ambiguous in its terms, that it may be understood with equal propriety in two different senses, it is the duty of the insurer to seek an explanation; and when such a representation is understood by him in a sense different from that intended by the assured if he had omitted to inquire, he will not be permitted to aver its falsity. A representation of future facts, although positive in its terms, may in some cases be justly interpreted, not as an undertaking for the truth of the facts, but as referring solely to the expectation or belief of the party. When a representation of future facts is inconsistent with the terms of the policy, it is not to be rejected. The policy remains the sole evidence of the agreement; but the representation may be operative, by construing it to refer to the intentions of the assured at the time of making it. 151. The words of a representation must be construed in reference to the usages of trade, or in their technical and commercial sense. A representation may supersede a usage and an implied warranty. Where there are several underwriters on the same policy, a representation to the first is construed to extend to all, so that each, when it proves to be false, may avail himself of the defense. This rule is strictly confined to the cases in which the representation is made to the underwriter whose name stands first on the policy. The terms of the rule are restricted to underwriters on the same policy, and it is confined to cases in which the representation to the first underwriter was favorable to the risk, and to such cases the rule exclusively applies. 152. Where the subscription of the first underwriter is obtained under a secret agreement that it is not to be binding, and for the sole purpose of deceiving others to insure, the exhibition of the policy thus subscribed is the assertion of a falsehood, and the contract is void. A representation once made is binding on the party, unless it is altered or withdrawn before the insurance is effected. The completion of the policy is therefore the time to which the representation is construed to refer. 153. A representation, to be binding, must be material, and, to discharge the insurer, must be false wholly or partially, and, according to the character of the representation, false in fact or in the event. It is not necessary that the facts represented should be material to the risk, that is, should affect or change the value of the risk, considered in themselves. The materiality required is not absolute, but relative, and its test is the actual or probable influence of the facts represented on the mind of the insurer. In judgment of law a representation is false when it fails to correspond with the facts that it affirms or stipulates; and hence its falsity is either intentional or accidental. 154. When the representation, whether affirmative or promissory, is made with an intent to deceive, the fraud in all cases vitiates the contract; nor to produce this effect is it requisite that the falsity should be entire: partial falsity, when intentional, is equally a fraud; and an inquiry into the materiality of the charge, as affecting the character and value of the risks, would never be allowed. 155. When the falsity of the representation is accidental, its effect upon the contract will depend, first, upon the nature and extent, and next upon the period of time to which it is to be referred. The falsity of the representation, when entire, in all cases discharges the insurer; but such is not its necessary consequence when it is only literal or partial. The substantial falsity of a representation, in cases exempt from fraud, does not always render the con-

tract wholly void. When the representation is false when made, or at the commencement of the risks, such is the necessary effect, but when the policy has attached, and the representation is falsified by a subsequent event, the breach does not, by a retro-active force, render the policy void in its origin. 156. When the assured has no personal knowledge of the facts he desires to represent, and is unwilling to bind himself by a positive statement, he may qualify the representation by adding, that it is made from the information of others, or may submit the information in its whole extent to the insurer. When the assured submits the information in extenso to the insurers, he is not answerable for the actual or eventual truth of the facts that it embraces, nor, in any case, for the accuracy of the conclusions that the insurers may draw from it. It would be different if the information proceeds from an agent of the assured whose duty it is to give the intelligence. 157. The assured is responsible when the policy is induced by a false representation of his own agent. Where the assured, or his agent in his name, declares that he intends to pursue a certain course, or perform certain acts favorable to the risks, he has entire liberty to change the intentions so declared; but if the representation is made with an actual intent to deceive, the fraud vitiates the contract. Where the party seeking the insurance declares his own expectation, or that of his principal, in regard to the existence or happening of a fact or event that, if true, would diminish the risks, the effect of the representation must depend upon its just interpretation. The same will be for a representation of a belief of a material fact. It is from the character of the party, and his relation to the subject, that such representation acquires strength.

Of the Right and Duties of the Insured in case of Loss.

Section I.—Of Abandonment.—158. A total loss, within the meaning of the policy, may arise either by the total destruction of the thing insured, or, if it specifically remains, by such damage to it as renders it of little or no value. A loss is said to be total if the voyage be entirely lost or defeated, or not worth pursuing, and the projected adventure frustrated. It is a constructive total loss if the thing insured, though existing in fact, is lost for any useful purpose to the owner. In such cases the insured may abandon all his interest in the subject insured, and all his hopes of recovery to the insurer, and call upon him to pay as for a total loss. 159. In cases of abandonment the insurer stands in place of the insured, and takes the subject to himself, with all the chances of recovery and indemnity. A valid abandonment has a retrospective effect, and does of itself, and without any deed of cession, transfer the right of property to the insurer, to the extent of the insurance; and if, after an abandonment duly made and accepted, the ship should be recovered and proceed and make a prosperous voyage, the insurer, as owner would reap the profit. 160. As soon as the insured is informed of the loss he ought (after being allowed a reasonable time to inspect the cargo, and for no other purpose), to determine promptly whether he will or will not abandon; and he can not lie by and speculate on events. If he elects to abandon, he must do it in a reasonable time, and give notice promptly to the insurer of his determination, otherwise he will be deemed to have waived his right to abandon, and will be entitled to recover only for a partial loss, unless the loss be in fact absolutely total. If the thing insured exist in specie, and the insured wishes to go for a total loss, an abandonment is indispensable. The main general doctrines respecting abandonment being entirely incorporated into the English law, it would be useless to insert them at length. 161. An abandonment once rightfully made is binding and conclusive between the parties, and the rights flowing from it become vested rights, and are not to be divested by subsequent events. The right to abandon is to be tested by the actual facts at the time of the abandonment, and not up-

on the state of the information received. Upon a valid abandonment, the master becomes the agent of the insurer, and the insured is not bound by his subsequent acts, unless he adopts them. 162. It is the same thing with the assignee of the cargo. On an accepted abandonment of the ship, the freight earned previous to the disaster is to be retained by the owner or his representative, the insurer of the freight, and apportioned *pro rata itineris*, and the freight subsequently to be earned goes to the insurer on the ship.

Section II. Of the Adjustment of Partial Losses.—

163. In an open policy, the actual or market value of the subject insured is to be estimated at the time of the commencement of the risk. 164. There are two kinds of indemnity that may lawfully be obtained under a contract of insurance. The first is to pay what the goods would have sold for if they had reached the place of their destination; and the value there consists of the prime costs and expenses of the outfit, the freight and expenses at the port of delivery, and the profit or loss arising from the state of the market. This puts the insured in the same situation as if no loss had happened. The other kind of indemnity is to pay only the first cost of the goods and the expenses incurred; and this places the insured in the situation he was before he undertook the adventure. 165. The actual or market value at the port of departure may frequently be different from the invoice price or prime cost, and when that happens, or can be ascertained, it is to be preferred. 166. If goods arrive damaged at the place of destination, the way to ascertain the quantity of damage, either in open or valued policies, is to compare the market price or gross amount at which the same goods would have sold if sound. There is a material difference between the adjustment of a partial loss and of a general average, since the former is adjusted according to the value at the time and place of departure of the vessel, and the latter according to the value at the foreign port. 167. In settling losses under the memorandum in the policy which declares articles free of average under, say 4 per cent., if a partial loss to an article be found on survey and sale to have been 5 per cent., the insurer pays the damages and the expenses. If under 5 per cent., he pays nothing, and the insurer bears the expenses. The expenses are like costs of suit, and fall upon the losing party. The expenses are not taken to make up the 5 per cent. 168. With respect to leakage, the rule in cases free from special stipulations is, that the insurer is not liable for waste occasioned by ordinary leakage, and only for leakage beyond the ordinary waste and produced by some extraordinary accident. The practice is to ascertain in each case what amount of leakage is to be attributed to ordinary cases, or the fault of the insured, or bad stowage, and what to the perils of the sea; and, in pursuing his inquiry, the season of the year, the nature of the articles, the description of the vessel, the length of the voyage, and the stowage, are all to be considered. 169. An adjustment of a loss can not be set aside or opened except on the ground of fraud or mistake of facts not known. In making the adjustment in the case of a partial loss, the rule is to apply the old materials toward the payment of the new, and a deduction of one third new for old is made whether the vessel be new or old. 170. The insurer is liable for all the labor and expenses attendant upon an accident which forces the vessel into port to be repaired; and in consequence of the general permission in the policy for the insured to labor for the recovery of the property, the insurer may be rendered liable for the expenses incurred in the attempt to recover the lost property in addition to the payment of a total loss.

Of the Return of Premium.—171. The premium paid by the insured is in consideration of the risk which the insurer assumes, and if the contract of insurance be void ab initio, or the risk has not been commenced,

the insured is entitled to a return of premium. If the insurance be made without any interest whatsoever in the thing insured, and this proceeds through mistake, misinformation, or any other innocent cause, the premium is to be returned. So if the insurance be made with short interest, or for more than the real interest, there is to be a ratable return of premium. If the risk has not been run the premium must be returned. 172. If the interest has not been run, whether it be owing to the fault, pleasure, or will of the insured, or to any other cause, the premium must be returned for the consideration for which it was given fails. 173. If the vessel never sailed on the voyage insured, or the policy became void by a failure of the warranty, and without fraud, the policy never attaches; but if the risk has once commenced, though the voyage be immediately thereafter abandoned, there is no return or apportionment of premium. 174. And if the premium is to be returned, the insurer retains $\frac{1}{2}$ per cent. by way of indemnity for his trouble and concern in the transaction. 175. The insurer retains the premium in all cases of actual fraud on the part of the insured or his agent. So if the trade be in any respect illegal, the premium can not be reclaimed. If the voyage be divisible, there may be an apportionment of the premium, but not unless the risk were divisible and distinct in the policy. If the voyage and premium be entire, there can be no apportionment. It is requisite that the voyage, by the usage of trade or the agreement of the parties, be divisible into distinct risks; and, in that case, if no risk has been run as to one part, there may be an apportionment of premium.—See *DUER on Marine Insurance*.

Losses of the Boston Stock Insurance Companies.—According to the annual report of the insurance commissioners, the following were the issues of the various stock insurance companies of Boston for the year ending November 1, 1856:

Companies.	Fire.	Marine.	Total
American.....	\$5,076 08	\$137,179 70	\$142,255 78
Boston.....	197,623 30	197,623 30
Boylston.....	8,044 89	828,440 06	441,484 94
City.....	17,533 08	17,533 08

Washington.....	1,292 06	235,909 05	237,201 11

As the commissioners observe, the past year or two have been unusually disastrous to the marine insurance companies, who, in most cases, pay a portion of their losses from the reserved funds of more favorable years. The North American Company reports no losses, either fire or marine. The annual report of the Boston Board of Trade represents the following losses, etc., for the year 1856:

Class of disasters.	Ships.	Ins'rs.	Engs.	Schooners.	Steamers.	Total.	Boston ships.	Others.
Missing vessels.....	1	2	1	6	..	10	11	7

II. *Fire Insurance.*—It is impossible to estimate too highly the value and importance of insurance, and the benefits conferred on mankind by the invention, whether it be considered in its original character as a protection to the merchant who adventured his property on the bosom of the treacherous deep—against its many perils—or in its more modern applications, as a guaranty against loss by fire, and its further interesting adaptation to the assuring of life. Considering that maritime insurance was well known, and insurance on life understood and practiced, to a certain extent, in several mercantile countries by the middle of the 16th century, it appears extraordinary, when we call to remembrance the devastations and distresses oc-

casioned by fire in Great Britain, that some means should not have been adopted at an earlier period to render such calamities less ruinous to individuals, particularly when a plan, which appears eventually to have formed the basis of the present insurance companies, was suggested so early as 1609.

In that year, a person proposed to Count Anthony Gunther von Oldenburg, that, as a new species of finance, he should insure the houses of all his subjects against fire, on their paying so much per cent. annually, according to their value; but the prospect of gain so tempting to most persons, could not induce the Count to adopt the plan. He thought it good if a company was formed of individuals to insure each others' houses, but he doubted that it could by him be "honorably, justly, and irreproachfully instituted without tempting Providence—without incurring the censure of neighbors, and without disgracing one's name and dignity," adding that "God had without such means preserved and blessed, for many centuries, the ancient house of Oldenburg, and He would still be present with him through his mercy, and protect his subjects from destructive fires." This plan appears not to have been again thought of until the fire of 1666 had laid the city of London in ashes.

In consequence of this calamitous event, the citizens began to see the importance, and indeed necessity, of erecting their buildings of a material less susceptible of fire than hitherto; also of adopting a regular system of precaution against future accidents, as well as of devising some scheme for mutual pecuniary protection and relief. Various proposals were accordingly submitted to the Court of Common Council of the city of London, between 1669 and 1680, for the mutual relief of such as might have their houses destroyed by fire—the most notable and acceptable of which was by one of their own body, Mr. Deputy Newbold. But if we may judge from the length of time that elapsed ere the worshipful committee made their report to the court, we should conclude the adopting of the proposal to have been attended with serious difficulties, and in verification of the old proverb that "delays are dangerous," during the period between the first presentation of Mr. Newbold's proposals to the Lord Mayor, and the final report of the committee, to whom the matter was referred by the Court of Common Council, several private individuals associated themselves together, and submitted to the good citizens of London a "design for insuring houses from fire," and on the 16th September, 1681, a notice or advertisement was issued from their "office, on the back side of the Royal Exchange," offering to insure brick houses against fire for *sixpence*, and timber houses for *twelvepence in the pound*—being at the rate of £2 10s. per cent. for the brick houses, and of £5 per cent. for timber.

Subsequently, on the 13th October, 1681, the Court of Common Council did "agree and resolve to undertake ye insuring all houses within this city and liberties from fire, and execute ye same with all expedition," and thereafter "resolved forthwith to engage a sufficient fund, and undoubted security by the chamber of London, in lands and good ground rents, for the performance thereof." Much amusing pamphleteering and advertising in the *Gazette* took place between the advocates of the corporation scheme, and the "interested" in the sale insurance office on the back side of the Royal Exchange.

The journals of the Court of Common Council in 1681, 1682, and 1683, record the signing of many policies, and bear amusing evidence of the zeal and prudence of the fire insurance committees in promulgating the benefits of the corporation scheme, and combating the antagonistic pamphlets issued by their competitors.

As the fruit of this pamphleteering agitation, the subject was brought under the most serious considera-

tion of the court on the 13th November, 1682, as appears by a minute of that date; when the court evinced a much greater anxiety to relinquish than they had to undertake the design, and directed the discharge of existing contracts, with the prepayment of the money which had been advanced.

Notwithstanding this resolution, however, contained in the foregoing minute, we find several policies subsequently passed the common seal, on the 6th March and 3d May, 1683.

After this, the city discontinued issuing policies, and having had a *quo warranto* brought against their charter, every exertion was used to obtain a surrender of the existing policies, and thus release the city lands from the incumbrances thereon.

The last matter taken into consideration, was the petition of Mr. Newbold, the author of the design which turned out so unsuccessful for remuneration, for the time, trouble, and expense he had been at, which was referred to a committee who reported on the 13th October, 1696, and on the 8th December following it was "resolved to give him the benefit of making two persons free of this citie by redemption, paying to Mr. Chamberlin to the citie's use of fortie-six shillings eight pence a-piece, the said persons to be first presented and allowed of by this court." This was the fate of the "City's Design and Undertaking for the insuring of Houses from the evil of Fire." The "interested" in the rival office became, of course, greatly elated, and their success led to the formation of several other companies or mutual insurance societies, for protection against fire.

In 1696, the *Hand-in-Hand Fire Office* was established by about 100 persons, who afterwards formed a deed of settlement, enrolled in Chancery January 24, 1698. This office is remarkable at the present day for its age, and is the only surviving one of those of that period.

Up to the year 1706, the protection afforded by fire insurance societies was limited entirely to houses (*buildings*), but in that year the *Sun Fire Office* was projected by one Charles Povey, for insuring merchandise and household goods (as well as houses) from fire, and was the first office to extend the benefits of insurance beyond the confines of London. This office has for very many years stood first on the list in amount of business.

There is also a stamp duty of 1s. on each policy.

By far the greater number of the above are joint-stock companies, who insure at their own risk and for their own profit, and are represented by agents in all the principal towns of the kingdom; the remainder are joint-contribution, or mutual insurance societies, in which every insurer participates in the profit or loss of the concern.—E. B.

Practice of Fire Insurance.—The advantages of fire insurance are too well known to require any very elaborate description. A manufacturer or private individual can, by the payment of an annual sum (premium) proportioned to the risk, secure himself against loss in the event of his manufactory or dwelling-house, or their contents, being destroyed by fire.

The Law of Fire Insurance in the United States.—*Of the usual subject and form of this insurance.*—We have seen that fire is one of the perils insured against by the common marine policies. It is usual, however, to insure building and personal property which is not to be water borne, against fire alone; and this is what is commonly called fire insurance. The general purposes and principles of this kind of insurance are the same as those of the marine insurance; and the law in respect to it differs only in those respects and in that degree in which the difference is made necessary by the subject-matter of the contract. It will be proper, therefore, to confine ourselves in this chapter, mainly to the statement of these differences and to consider those general principles which have already

been discussed, only so far as this may be necessary for the comprehension or illustration of the peculiarities which belong to fire insurance. This kind of insurance is sometimes made to indemnify against loss by fire, of ships in port; more often of warehouses, and mercantile property stored in them, still more frequently of personal chattels in stores or factories, in dwelling-houses or barns, as merchandise, furniture, books, and plate, or pictures, or live stock. But by far the most common application of this mode of insurance is to dwelling-houses. Like marine insurance, it may be effected by any individual who is capable of making a legal contract. In fact, however, it is always or nearly always in this country, and we suppose elsewhere, made by companies. There are stock companies, in which certain persons own the capital, and take all the profits by way of dividends. Or mutual in which every one who is insured, becomes thereby a member, and the nett profits, or a certain proportion of them, are divided among all the members in such a manner as the charter or by-laws of the company may direct. Or both united, in which case there is a capital stock provided, as a permanent guaranty fund, over and above the premium received, and a certain part or proportion of the nett profits is paid by way of dividend upon the fund, and the residue divided among the insured. *PARSONS ON Contracts.*

Of late years the number of mutual fire insurance companies has greatly increased in this country, and probably by far the largest amount of insurance against fire is effected by them. The principal reason for this is undoubtedly their cheapness; the premiums required by them being in general, very much less in fact than in the stock offices. For example, if the insurance is effected for seven years, which is a common period—an amount or percentage is charged about the same as, or a little more than is charged as the stock companies. Only a small part of this is taken in cash; for the rest a premium note or bond is given, promising to pay whatever part of the amount may be needed for losses, which shall occur during the period for which the note is given. More than this, therefore, the insured can not be bound to pay, and it frequently happens that no assessment whatever is demanded; and sometimes where the company is well established, and does a large business upon sound principles, a part of the money paid by him is refunded when the insurance expires, or credited to him on the renewal of the policy if such be his wish. The disadvantage of these mutual companies is, that the premiums paid, and premium notes, constitute the whole capital or fund, out of which losses are to be paid for. To make this more secure it is provided by the charter of some companies, that they should have a lien upon the land itself on which any insured building stands to the amount of the premium. But while this adds very much to the trustworthiness of the premium notes, and so to the availability of the capital, it is, with some persons, an objection, that their land is thus subjected to a lien or incumbrance.—*Ibid.*

There is another point of difference which recommends the stock rather than the mutual company. It is that the stock company will generally insure very nearly the full value of the property insured, while the mutual companies are generally restrained by their charters from insuring more than a moderate proportion, namely, from one half to three fourths of the assessed value of the property. It would follow, therefore, that one insured by a mutual company can not be fully indemnified against loss by fire; and may not be quite so certain of getting the indemnity he bargains for, as if he were insured by a stock company. But this last reason is, practically, of very little importance, and the lowness of the premiums effectually overcomes the other. The method and operation of fire insurance have become quite uniform throughout the country, and any company may appeal to the

usage of other companies to answer questions which have arisen under its own policy; only, however, within certain rules, and under some well-defined restrictions. In the first place, usage may be resorted to for the purpose of explaining that which needs explanation, but never to contradict that which is clearly expressed in the contract. "And no usage can be admitted, even to explain a contract, unless the usage be so well established and so well known, that it may reasonably be supposed that the parties entered into the contract with reference to it." Thus if under a policy against fire on a vessel in one part of this country, an inquiry is raised as to the local usage, the policy is not to be affected by proof of usage upon any particular matter in other parts of the world, or even of the United States. And not only the terms of the contract must be duly regarded, but those of the charter; thus if this provides that "all policies and other instruments made and signed by the president or other officer of the company, shall bind the company," an agreement to cancel the policy should be signed; although it can not be doubted that a party insured might otherwise give up his policy, or renounce all claim under it, and that a valid agreement to that effect between him and the company would not be set aside for his benefit, on the ground of a merely formal defect.—*Ibid.*

In regard to the execution of a fire policy, and what is necessary to constitute such execution—as, for example, whether delivery is necessary or a signed memorandum be sufficient, or indeed an oral bargain only, and whether this insurance may be effected by correspondence, and if when the proposition and assent complete the contract—we are not aware of any material difference on any of these points, between the law of fire insurance and that which has already been presented as applicable to marine. It has been held in an action on a fire policy, as doubtless it would be on a marine policy, that a memorandum made on the application book of the company by the president, and signed by him, was not binding, when the party to be insured wished the policy to be delayed until a different adjustment of the terms could be settled, and after some delay, was notified by the company to call and settle the business, or the company would not be bound, and he did not call; because there was here no consummated agreement. So, too, a subsequent adoption or ratification is equivalent, either in a fire or marine policy, to the making originally of the contract; with this limitation, however, that no party can by his adoption, secure to himself the benefit of a policy, if it had not been intended that his interest should be embraced within it. It is quite common to describe the insured in marine policies, by general expressions—as, "for whom it may concern," or, "for owners" or the like; but such language is seldom if ever used in fire policies, the insured being specifically named in them.—*Ibid.*

It may be remarked, that the effecting of a fire insurance is not so often done through the agency of a broker, as that of marine insurance; nor is it so usual to pay nothing down, but to give a note for the whole premium. If, however, the insurance company has an express rule to that effect, it may be waived; and this waiver may be express or implied, from the conduct of officers of the company who have the right to act for it; and their admissions bind the company.—*Ibid.*

On the Interest of the Insured.—As to what interest in the insured is sufficient to support an insurance, the principle is the same in fire as in marine insurance. Any legal interest is sufficient; and if it be equitable in the sense that a court of equity will recognize and protect it, that is sufficient; but a merely moral or expectant interest is not enough. Hence, one who has only made an oral bargain with another to purchase his house, can not insure it; but if there be a valid contract in law, or if by writing, or by part perform-

ance, it is enforceable in equity, the purchaser may insure. So he may, although there be a stipulation, the breach of which has made the contract void by its terms, if the other party might waive the condition and enforce the contracts. So if a debtor assign his property to pay his debts, he has an insurable interest in it until the debts are paid, or until the property be sold. This was so held where it appeared that the property would pay the debts, and leave a surplus for the assignor; but we should expect the same ruling where this was not the case, although, in this instance, there had been previously a verdict for the plaintiff, and a new trial for want of evidence of such surplus.—*Ibid.*

Of Reinsurance.—Reinsurance is equally lawful in fire policies as in marine policies, and in general is governed by the same rules. The reinsurance is an insurance, not of the risk of the insured, for that is a merely ideal thing, but it is an insurance of the property originally insured, in which the first insurers have an insurable interest. If a common policy be used, with no other change than the word reinsurance used instead of insurance, all its requirements are in force. If, for example, in case of loss, this property requires a certificate from a magistrate, as to character, circumstances, etc., that must be furnished by the reinsured. But if a suitable certificate were given by the party first insured to the original insurer, and he transmit the same forthwith to those who insure him, that is enough; and so it would be with notice, preliminary proof, and all similar requirements. And an insurer who obtains reinsurance, is bound to communicate (in addition to whatever else should be stated by one asking insurance), all the information he has concerning the character of the party originally insured; and a material concealment on this point would avoid the policy.—*Ibid.*, page 516.

Of Double Insurance.—Double insurance, although sometimes confounded with reinsurance, is essentially different. By this, the party originally insured becomes again insured; but by reinsurance, the original insurer is insured, and, as we have seen, the original insurer has no interest in, and no lien upon, this policy. If, by a double insurance, the insured could protect himself over and over again, he might recover many indemnities for one loss. This can not be permitted, not only because it is opposed to the first principles of insurance, but because it would tempt to fraud, and make it very easy. This effect may be obviated in two ways: one, by considering the second insurance as operating only on so much of the value of the property insured, as is not covered by the first; and then, as soon as the whole value is covered, whether by the first or by subsequent policies, any further insurance has no effect. A second way is, by considering the second insurance as made jointly with the first; then only as much would be paid on any loss, on many insurances, as on one only; but this payment is divided ratably among all the insurers. All the policies are considered as making but one policy; and therefore, any one insurer who pays more than his proportion, may claim a contribution from others who were liable.—*Ibid.*

In this country fire policies usually contain express and exact provisions on this subject. They vary somewhat; but, generally, they require that any other insurance must be stated by the insured, and indorsed on the policy; and it is a frequent condition, that each office shall, in that case, pay only a ratable proportion of a loss; and it is often added that, if such other insurance be not so stated and indorsed, the insured shall not recover on the policy; and it has been held that such a condition applies to a subsequent as well as a prior insurance. Nor will a court of equity relieve if sufficient notice and indorsement have been made. But it has been held that a valid notice might be given to the agent of the company, who was authorized to

receive applications and survey property proposed for insurance.—*Ibid.*

Of the Risk incurred by the Insurers.—At the time of the insurance the property must be in existence, and not on fire, and not at that moment exposed to a dangerous fire in the immediate neighborhood, because the insurance assumes that no unusual risks exist at that time.—*Ibid.*

The U. S. Insurance Gazette for March contains the report of the insurance commissioners, appointed by the comptroller to inquire into the affairs of the fire insurance companies of New York and Brooklyn. The leading features of the report are contained in the annexed table. The examinations were made from March to December:

Name of Company.	Value of bonds and mortgages.	Value of loans on stocks.	Amount of annual premiums.	Amount of re-insurance & after last dividend.

Of Adjustment and Loss.—Insurers against fire are not held to pay for loss of profits, gains of business, or other indirect and remote consequences of a loss by fire; we do not know, however, why profits may not be specifically insured against fire, where it is not forbidden by, or inconsistent with, the charter of the in-

surers. There is one wide difference between the principle of adjustment of a marine policy, and of a fire policy. In the former, if a proportion only of the value is insured, the insured is considered as his own insurer for the residue, and only an equal proportion of the loss is paid. Thus, if on a ship valued at \$10,000, \$5000 be insured, there is a loss of one half, the insurers pay only one half of the sum they insure, just as if some other party had insured other \$5000. But in a fire policy, the insurers pay in all cases the whole amount which is lost by the fire, provided only that it does not exceed the amount which they insure. It is said that general average clauses or provisions are inserted in fire policies in England, but are not known here. Still, in one case, the principle of general average was applied. Blankets were used by the assured, with the consent of the insurers, to protect the building from a near fire; they did this effectually, but were themselves made worthless, and an action by the insured against the insurers, for this loss, was sustained by the court.—*Ibid.*, p. 537.

Life Assurance.—It is curious to observe that life assurance, which has so favorable a bearing on our social and moral welfare, may be said to have originated from the study of the laws of chance, as observed in the experience of the gambler. It will be remarked, however, that the one is the very antithesis of the other. In life assurance, the individual is freed from risk by union for mutual protection with his fellow-men. The gambler takes the single risk upon himself, and his average, if he obtain it, can only arise from the duration of his play. In fact, the man who has the opportunity of assuring his life, and does not do it, is the gambler, taking the single risk upon himself.

That the one practice took its origin, however, from the observation of the other, there can be no doubt; the earliest mathematical publication on probabilities, being a little tract of Christian Huygens, written in Dutch, but afterward translated into Latin, and appearing under the title "*De Ratiociniis in Ludo Alex.*" in the *Exercitationes Geometricæ* of Francis Schooten, printed at Leyden, 1657. Two other mathematicians, however, who preceded Huygens, really laid the foundation of the science, although he wrote the first systematic treatise on the subject. We refer to the famous Pascal, and Fermat his friend, a magistrate of the Parliament of Toulouse. But as the history of the general doctrines of probabilities is given under that head, we must confine our remarks to the history of that doctrine as applied to the duration of life, and the progress of life computations.

It has been usual to commence the history of life contingencies with the little volume of "John Graunt, citizen of London," who published observations on the bills of mortality in 1662; but Mr. Hendriks has given the means of more remote speculation on the subject.

The practice in the days of Herodotus was to reckon three generations equivalent to a century, and the census of Vespasian, as noticed in Pliny, distinguished cases of extreme longevity. But we do not find any thing like an observation on the subject until we come to the calculations of the Prætorian præfect, Ulpianus, one of the most eminent commentators on the Justinian Code, who gave a table of the estimated present worth of life annuities, with reference to the requirements of the Falcidian law, which rendered it necessary to put a value on life-rents and other similar provisions. Ulpianus, however, took no account of interest, so that his calculations are more expectations of life than life annuities, and in that view Mr. Hendriks says, "The old Roman jurisprudence gave far more correct views of the comparative value of life at different ages than the moderns possessed, in a popular way, until nearly the close of the 17th century." Ulpianus's calculations (*Pandect*, 35-2-68), compared with

certain Swedish observations given by Dr. Price, are as follows:

Ages.	Stockholm life. Dr. Price.		Ages.	Expectations Male and female. Roman life. Ulpianus.
	Expectation of Males. Females.			
Birth.	14-25	18-10	Birth—20.....	30
5	31-05	37-12	20—25.....	28
10	30-00	36-59	25—30.....	25
15	26-74	33-43	30—35.....	22
20	23-55	30-01	35—40.....	20
25	21-40	26-80	40—41.....	19
30	19-42	23-98	41—42.....	18
35	17-53	21-62	42—43.....	17

			55—60.....	7
			60 and upward.	5

It seems abundantly evident that Ulpianus's estimate must have been based on actual observations in some form, but the Romans must have had a miserable chance of life in old age.

From that period we have nothing to attract attention till the 16th century, when Dr. (or Sir) Thomas Wilson, who died in 1581, published his *Discourse upon Usurie*, which contains illustrations of endowment transactions on the lives of children, but the life contingency portion seems merely incidentally introduced with reference to questions as to usury.

In 1661, M. Cleirac, the author of *Les us et Coutumes de la Mer*, notices the *Guidon*, "a French production, formerly compiled for the benefit of the merchants trading in the noble city of Rouen." This work is nearly 300 years old, its author's name is unknown, but it is a most curious document, in consequence of the reference it makes to assurance matters. From Mr. Hendriks we give the following translation, omitting Cleirac's notes:

"1. In other countries, where the bodies of people may be captured and reduced to bondage, there are various usages for the insurance of the body and life of men, whether they be of free condition, or slaves, which customs will not be mentioned here, because in France, men of whatsoever nation are of frank and free condition.

"2. Notice only will be taken of what is practiced in this country by those who undertake distant voyages, as to the coast of Italy, Constantinople, Alexandria, or other like voyages in the Mediterranean and Atlantic seas, on account of the fear which they have of the galleys, *fustes*, and frigates of the army of the Turk, or Corsairs, who make a traffic of the sale of Christians, whom they capture as well on sea as on land; which creates occasion for the masters and captains of this country, when they undertake such voyages, to stipulate with their merchant freighters, or others, for the restitution of their persons, in case they are captured; and this they can do even for the people of their crew.

"3. In such a case, the master must, in the policy, estimate his ransom, and that of his companions, at so much per head; declare the name of the ship, the stay or touchings which it will make, the duration of each stay, and to whom the ransom is payable. The insurer is bound to pay the sum insured for the ransom 15 days after verification and certification of the captivity, without waiting for the usual two months' delay; and without other formality of seeing freightage, bill of lading, or charter party, it will suffice to produce the attestation of capture and policy.

"4. Pilgrims going to the Holy Sepulchre of Jerusalem, or on other distant voyages, may effect insurance for their redemption, valued at a given amount. Description shall besides be made of their persons, names, surnames, country, abode, age, and rank; and,

moreover, limit shall be made as to within what time they undertake to make and accomplish the voyage: the longest period shall be of three years inclusive, tion whatsoever. In imitation of the preceding, those without admitting excuse of illness, or other detention undertake journeys or vows for a lengthened period, or a passage from one country to another, may insure for their ransom.

"5. Another kind of insurance is made by other nations upon the life of men, in case of their decease upon their voyage, to pay certain sums to their heirs or creditors. Creditors even may insure their debts, if their debtor remove from one country to another; the same can be done by those having rents or pensions, so as in case of their decease, to continue to their heirs such pension or rent as may be due to them. Which are all stipulations forbidden, as against good morals and customs, from which endless abuses and deceptions arose, whence they have been constrained to abolish and prohibit the said usages; which is also to be prohibited and forbidden in this country."

The most remarkable feature of these times was the condemnation of, and legislation against, the practice of assurance in many countries. Not only in France was it assumed unrecognizable by law, but in the Netherlands' ordinance of Philip II., and in the civil statutes of Genoa (1588), in which last it is declared that "securities, bonds, or wagers may not be made, without the license of the Senate, upon the life of the pope, nor upon the life of the emperor, nor upon the life of kings, cardinals, dukes, princes, bishops, nor upon the life of other lords or persons, in constituted dignities, ecclesiastical or secular. Neither may they be made upon the acquisition, loss, or change of lordships, governments, kingdoms, provinces, duchies, cities, lands, or places . . . nor upon any other transaction having the species or form of a bond, security, or wager (*vadimonii securitatis, seu partis*); but all are understood and are forbidden." The 24th article of the Amsterdam ordinance of 1598 prohibits insurance of the life of any person, and likewise wagers upon any voyage or frivolous purpose; and the Rotterdam ordinances of 1604 and 1635 repeat the latter injunctions. The 10th article (*Titre 6*), of the great French marine ordinance of Louis XIV., dated 1681, says, "We forbid the making of any insurance on the life of men;" but the 11th article excepts those who redeem captives, and guarantees the price of the redemption assured upon the persons, if the redeemed on his way back perish by other means than natural death. "Even later than the 17th century," adds Hendriks, "life insurance was regarded in France as obnoxious. In 1783, there remained a spirit of opposition to it. Emerigon, whose work on assurance comprises more than 1300 quarto pages, devotes one page to the subject of life assurance, and that short space to the purpose of attacking the system."

But we must now pass on to a more interesting period, when we are called on to consider the conflicting claims of great names, with reference to the origination and practical application of the doctrine of annuities, as derived from the study of the laws of chance or probability.

John de Wit, the grand pensionary of Holland, submitted to the States-General of Holland, in 1671, a treatise on the valuation of life annuities, and on the basis of that document, it was resolved to grant life annuities for the purpose of raising funds. This treatise Mr. Hendriks characterizes as "the first known production of any age treating in a formal manner of the valuation of life annuities," and the scientific world are much indebted to him for the restoration of this document, which was inserted in the resolutions of the States of Holland and West Friesland of the year 1671, and which had remained as good as lost for 180 years.

In the preparation of this document De Wit was no doubt aided by the preceding labors of Pascal,

Fermat, and Huygens, and he had no doubt the advantage of observations on the duration of life among persons to whom the States of Holland had previously granted annuities; but, independently of the originality of the design, we must give him the entire credit of having discovered a correct principle on which the value of a life annuity might be calculated.

De Wit's treatise is headed, "Value of Life Annuities in Proportion to Redeemable Annuities." He commences with pointing out the difference between a "redeemable annuity," as he terms it, at 4 per cent., that is a perpetuity at 25 years' purchase, or perpetual investment at 4 per cent., and a life annuity; estimating the value of the latter in the most favorable circumstances as "really not below, but certainly above 16 years' purchase." He then gives some preliminary observations on the doctrine of chances, and afterward applies the principle to the calculation of an annuity value at a particular age. His calculations are simplified and explained as follows by Mr. Hendriks:

"First, Out of 128 lives, aged say 3 years, 1 is supposed to die in every half year of the first 100 half years, or 2 per annum for 50 years, leaving 28 alive, aged 58 years, at the end of the term; out of whom 1 dies in every 9 months, being 0.66 per half year during the next 20 half years, or 1.33 per annum for 10 years, leaving 15.66 alive, aged 69 years, at the end of the second term; of whom 1 dies in every year for 10 years, being 0.5 per half year during the next 20 half years, leaving 5.66 alive, aged 73 years, at the end of the third term; of whom 1 dies in every year and a half for 7 years, being 0.33 per half year during the next 14 half years, leaving 1 alive, aged 80, at the end of the fourth term; which survivor does not live over another half year. Secondly, Out of the 128 lives, those who die in the respective half years between the ages of 3 and 80, will receive an annuity certain in half-yearly instalments, for a term equal in continuance to the number of completed half years elapsed between age 3 and the date of their death; therefore, the sum of the present values of half-yearly annuities certain, for the corresponding terms multiplied in the numbers dying within such respective terms, gives the present worth of all the annuities which will be enjoyed by the 128 lives, 1-128 of which represents the present value of the single life annuity at age of, say 3 years."

We have dwelt at some length on the discovery of De Wit, as it has not been available previously in any account given of the progress of life calculations, our best writers in this country, from the absence of any precise knowledge in regard to it, having passed it over with a slight notice. On the continent, however, the labors of De Wit have been more highly appreciated. The Marquis of Condorcet, in his *Discours Preliminaire*, gave him the credit of being "the first mathematician who thought of applying calculation to political questions." "It was he who first essayed to fix the rate of life annuities according to the probabilities of life given by the tables of mortality. Upon politics, upon the true interests of nations, upon the freedom of trade, he had very superior ideas to those of his age; and we may say that his premature death was a misfortune to Europe as well as to his country."

We can not conclude our notice of De Wit without mentioning the name of his fellow-laborer, if we may so term him, the Burgomaster Hudde. We had at one time rather a painful impression left on our mind, arising out of the terms of Hudde's certificate to the report of De Wit to the States-General, and other observations by Mr. Hendriks, but we are glad to find, from the correspondence subsequently brought forward, that they were fellow-laborers in the same field, and that Hudde himself was a man of science.

We have now to mention the first published work in which an attempt is made to form tables of mortality. We allude to the work of John Graunt, whose name has been already mentioned. It was published in 1662, and is the first book on the subject of life observations, as a distinct treatise. It is entitled, *Natural and Political Observations, mentioned in a following index, and made upon the Bills of Mortality*, by JOHN GRAUNT, citizen of London (afterward described in the fifth edition as "Captain John Graunt, F.R.S."). A century previous to the publication of this little volume, viz., on 1st January, 1562, the first register of burials was commenced in London, the necessity for the inquiry arising from the great mortality occasioned by the plague at that time. From that time the bills of mortality were kept at irregular intervals, according to the appearance and disappearance of the plague, but from 1603 the records were continued uninterruptedly. Graunt paid particular attention to these weekly returns, and, with a sagacious appreciation of their value, reduced the results into tables, "in order to the more ready comparing of one year, season, parish, or other division of the city." He analyzes the bills themselves, and draws certain conclusions with great adroitness, giving the first semblance of a table of mortality in the arrangement of deaths in decades. The work passed through five editions, the last under the superintendence of his relative Sir William Petty, who himself paid some attention to the subject, having published *Essays on Political Arithmetic concerning the People, Housings, etc., of London and Paris; Essay concerning the Multiplication of Mankind, and the Growth of the city of London; Observations on the Dublin Bills of Mortality, etc.; and Discourse on Duplicate Proportion*, read before the Royal Society, 1674.

From this time till 1693, when the celebrated Dr. Halley's investigations and calculations appeared, there is little to attract attention. A set of tables was published during this interval, entitled, *Tables for Renewing and Purchasing of the Leases of Cathedral Churches and Colleges, etc.*; also *Tables for Renewing and Purchasing of Lives, etc.*, bearing the imposing title of "Sir Isaac Newton's Tables;" but we learn from Mr. Edwin James Farren's historical *Essay on the Rise and Early Progress of the Doctrine of Life Contingencies in England*, that Sir Isaac Newton being then at Cambridge (Lucasian Professor *vice* Barrow), it appears to have been thought politic to obtain his sanction or imprimatur as to the correctness of the tables, and "his original cognizance of the work appears to have been to merely confirm the (Q.E.D.) correctness of a single table relative to the established usage of renewing college leases."

In No. 196 of the *Philosophical Transactions*, 1693, Dr. Halley published the result of his investigations under the following title: "An Estimate of the Degrees of Mortality of Mankind, drawn from curious Tables of the Births and Funerals at the city of Breslau, with an attempt to ascertain the price of Annuities upon Lives, by E. Halley, R.S.S."—E. B.

Additional information will also be found in the *Actuarial Tables* of W. T. Thomson, F.R.S.E., 1853, and in the very valuable *Tables and Formulas for the Computation of Life Contingencies*, of Mr. Peter Gray, published in 1849. In conclusion, the names of Edward Sang, Peter Hardy, Samuel Brown, Charles Jellicoe, William Wood, William Orchard, and B. H. Todd, may be selected for special notice from the long list of calculators who have advanced various departments of the science. Much valuable information on the subject will also be found in the *Assurance Magazine*; the *Reports of the Registrar-General*; and in the *Evidence given before the House of Commons*, in 1843, on Joint Stock Companies, and in 1858, on Assurance Associations. The evidence on Friendly Societies will also be found interesting.—E. B. See INTEREST and ANNUITIES.

The following summary of the plan of operation and condition of the Mutual Life Insurance Company of New York, is given to show the state of life insurance in the United States. This Company is the largest and one of the best managed in the country; and its condition may, therefore, be taken as a fair exponent of the others, and shows clearly to the insurers the safety of their policies.

Mutual Life Insurance Co., N. Y.—It will be perceived by the statement following that there have been issued in the past year (1856) 2,041 policies, amounting to \$5,878,457, being a net increase in policies of 1,016, and in amount of insured of \$3,119,902. The cash receipts have been \$1,045,235 17; the increase of investments on bonds and mortgages has been \$555,562 14, and the entire net increase \$610,749 94, irrespective of the items of interest accrued, and deferred premiums, which are not estimated. Total assets, \$3,787,945 76. The loans are at 7 per cent. interest. Aggregate amount of loans, May 1, 1856, \$3,187,858 56.

Securities.—Value of lands mortgaged, \$5,009,415; value of improvements thereon, \$3,513,650; aggregate value of mortgaged property, \$8,523,065.

Collaterals.—Policies of fire insurance, assigned or made payable, in case of loss, to the Company, \$1,702,636 85; personal guaranties to a considerable amount, say \$200,000. Total amount of securities, \$10,425,701. It will thus be seen that the value of the mortgaged property is more than twice and a half the amount of the loans they are intended to secure. These securities are fortified by collateral policies of fire insurance to the amount of \$1,702,636. The following schedule of the predicted losses by the tables, and the actual losses for the past 14 years, has been prepared by the Actuary:

A COMPARATIVE TABLE OF THE PROBABLE AND ACTUAL NUMBER OF DEATHS AND LOSSES, ACCORDING TO THE LIFE TABLE OF THE MUTUAL LIFE INSURANCE CO. OF NEW YORK.

Year.	Probable No. of deaths.	Probable amount of losses.	Number of deaths.	Actual amount of losses.
1843....	2-96	\$11,461
1844....	7-72	29,708	5	\$18,000
1845....	15-55	54,590	7	18,100
1846....	24-96	80,485	28	69,400
1847....	38-67	107,017	20	71,150
1848....	44-37	140,495	27	94,200
1849....	56-81	174,608	64	175,950
1850....	67-61	200,827	71	154,640
1851....	72-48	214,350	50	166,600
1852....	76-56	229,729	68	206,100
1853....	83-59	255,048	71	207,200
1854....	92-44	289,921	85	281,500
1855....	100-75	317,581	80	267,850
1856....	113-56	362,639	75	264,255
Total	793-03	\$2,471,359	655	\$1,994,945

In the above table the second column shows the probable number of deaths, according to the mortality tables now used in the United States. The third column represents the amount of such losses, whereas the fourth and fifth columns show the actual results in a business of 14 years. In none of these years has the Company lost the full amount called for in its tables.

But it must be borne in mind that life insurance is only in its infancy in this country, and that full 30 years must elapse before we can calculate results with any degree of certainty.

FOURTEENTH ANNUAL STATEMENT FOR THE YEAR ENDING 31st JANUARY, 1857.

RECEIPTS.
For premiums and interest, 1856..... \$1,045,235 17

DISBURSEMENTS.
Paid claims by death and expenses..... \$434,485 28

Not increase of assets during the year..... \$610,749 94

Not assets 31st January, 1856..... \$177,195 82

Total net assets 31st January, 1857..... \$3,787,945 76

Number of policies issued during the year..... 2,041

Amount insured by the same..... \$5,878,457 00

Number of policies in force 1st of February, 1857..... 9,794

The following is the division of the country into classes, showing the rates charged:

1. In the United States, north of the southern lines

of Virginia and Kentucky (except within 10 miles of the Mississippi and Missouri Rivers, between 36° 30' and 40° north latitude); in the interior of North Carolina, from the coast; in Tennessee, except within 50 miles of the Mississippi River; and in British North America. All to be east of the 100th meridian of longitude west from Greenwich.

2. *Additional Rates.*—Residences within 10 miles of the Mississippi and Missouri Rivers, between 36° 30' and 40° north latitude, $\frac{1}{2}$ per cent. The United States, south of the southerly line of Virginia and Kentucky, and north of the 32d degree of north latitude, except on the Mississippi River (east of the 100th meridian of west longitude), from 1st July to 1st November, for acclimated persons, $\frac{1}{2}$ per cent.

3. The United States, south of the 32d degree of north latitude (east of the 100th meridian west longitude), from 1st July to 1st November, for acclimated persons, 2 per cent. Acclimation is only deemed complete when the party has had the yellow fever.

4. Upper California, Oregon (except those engaged in mining), Australia (with similar restriction), China, Philippine Islands, and Sandwich Islands, for residence, 1 per cent. For South America, West Indies, East Indies, and other parts of the world not mentioned, rates will be named at the office corresponding with the risks, except in places prohibited.

5. Voyages and trips to and from California and Oregon, 1 per cent.; round the world, 2 per cent. Other voyages subject to special contract at this office. Master mariners and sea-faring men are taken at rates of premium graduated to the risk of the particular trade in which they may be engaged. The conditions as to voyages in such class are applicable to time of peace only, an additional rate being charged in time of war, if the risk of war should be taken by the Co.

Military and naval men are not protected when engaged in actual warfare; but if regularly called into actual service, and dying thereby, the Company will consider said death, under such circumstances, as a tender of their policy to the Company, and will pay the same value therefor as if surrendered by sale. Persons engaged in military corps are not held to come under military conditions, except in the event of foreign invasion.

Persons passing from one class to another.—Persons insured, who pass from a class where the risk is smaller to one which is greater, must apply at the office, and pay the enhanced premium. Persons coming from a class where the risk is greater, to where it is less, will commence to pay the reduced premium when the next renewal premium becomes due, should the extra premium be taken off. But where the health and constitution have become impaired by said residence, the extra premium will not be taken off. All reductions of the extra premiums charged, must be made at the office.

Acclimation for the purpose of life insurance is obtained, 1. By birth and continued residence in the place where insurance is sought. 2. By long continued summer residence, and during the season when and where epidemic and endemic diseases prevail. 3. By having had the disease incident to the climate or locality. 4. Acclimation against yellow fever is not considered complete unless the party has had it, and has continued since to reside in places where it is epidemic.

Rates for Insurance.—The rates adopted by this Company have been formed on the most correct observations which now exist, as to the duration of life at the different places where we insure. We believe that these rates can not be safely reduced, and that any attempt to do it, with the present limited experience in life insurance in this country, would evince a recklessness of results which would justly cost any Company which should attempt it, the withdrawal of the confidence of all who are conversant with the science and principles upon which this business is based.

THE RATES OF ASSURANCE OF ONE THOUSAND DOLLARS ON A SINGLE LIFE, FOR THE WHOLE CONTINUANCE THEREOF.

Age.	Quarterly payments for life.	Semi-ann. payments for life.	Annual payments for life.	Annual payments for 10 yrs.	Annual payments for 5 years.	In one payment.

Life insurance in the United States is as yet in its infancy, as far as regards the *science*, but the practice is rapidly gaining favor with all classes of the community, and the number availing themselves of its benefits in this country are daily increasing. Statistics of life and mortality are the foundation upon which the science of life insurance is erected, and reliable information regarding the relative value of life in different climates and at each age is of the greatest importance to a life company, in order to prosecute its business successfully. In Great Britain this information is obtained from two sources, viz., the experience obtained each year among the companies themselves; and, secondly, from the reports of the registrar-general which are annually made to Parliament. From the comparatively small area of the British Isles, and the excellent system of appointments by the government of its scientific men, great advantage is derived. The decennial census of Great Britain is taken in *one day*, which at once eliminates one of the most fruitful sources of error; and by having a registrar and corps of assistants in his office regularly educated and trained, a perfect system is adopted; and thus we have in their reports a mass of reliable, interesting, and valuable information which can nowhere else be obtained. Unfortunately, in the United States it is different. From the immense area of territory, embracing every variety of soil, climate, and physical configuration, it would be almost impossible, even if we had as perfect a system of registration as they have in England, to complete the enumeration of the census in a day, or even a few days.

For the tables of mortality upon which to determine the rates of premium to be charged for assurances upon lives, the American companies are entirely dependent upon European observations; and it is found by the experience of companies in this country, that the rate of mortality in Great Britain will very fairly represent that in the New England and Middle States. But in the Southern States and California it is very different. We have as yet no sufficient data for the determination of the relative mortality among residents of the different States in the Union; consequently, when a life company is called upon to insure the life of a person residing in the South or California, a sum is charged, in addition to the regular premium, for the increased risk in those climates, which is entirely arbitrary. Yet it has been shown in the report by the actuary of the experience of the Mutual Life Insurance Company of New York for ten years ending February 1, 1853, that the annual mortality among every 10,000 persons insured was as follows:

In the whole company	109
New England and Middle States	89
Western States	107
Southern States bordering on the Atlantic	127
" " " " Gulf	160
California	430

The experience of the company has also been computed since 1853, and will be published in 1858, which will include a period of fifteen years in the history of that company.

The following table is taken from the report of Dr. E. Barton, of New Orleans, to the president of the above company, on the relative mortality from yellow fever of persons from various parts of the world who emigrate to New Orleans. The table is an answer to the question, *What is the relative mortality between natives and strangers, American and European?*

Reply.—The answer to this must necessarily be twofold, viz.: 1st, in relation to the acclimated, and, 2d, the unacclimated. Of the first, the following table, with precise details of each nation and people, foreign and domestic, and from different latitudes, was made from the data furnished during the disastrous epidemic of 1853, this having been the most extensive and malignant yellow fever that ever occurred in New Or-

leans. This table was most carefully and laboriously compiled by myself, and is, I believe, the only one made that can furnish any reply to this most important question, and should be deemed a fair exponent of the general liabilities, as the greater should embrace the less.

TABLE SHOWING THE LIFE COST OF ACCLIMATION OR LIABILITIES TO YELLOW FEVER AS DERIVED FROM OR INFLUENCED BY NATIVITY, PER 1000 OF THE POPULATION.

Class.	From.	Per 1000.
1, 2.	New Orleans and the State of Louisiana	3-68
<i>Southern Slave States.</i>		
3.	Arkansas, Mississippi, Alabama, Georgia, and South Carolina	13-22
<i>Northern Slave States.</i>		
4.	Virginia, Maryland, Tennessee, Kentucky; and of this class of States, the largest mortality existed among those coming from Tennessee and Kentucky	80-09
<i>Northern States.</i>		
5.	New York, Vermont, Massachusetts, Maine, Rhode Island, Connecticut, New Jersey, Pennsylvania, and Delaware	52-83
<i>Northwestern States.</i>		
6.	Ohio, Indiana, Illinois, and Missouri	44-23
7.	British America	50-24
	General average in America	29-11
8.	West Indies, South America, and Mexico	6-14
9.	Great Britain	62-19
10.	Ireland	204-97
<i>North of Europe.</i>		
11.	Denmark, Sweden, and Russia	163-26
<i>Middle Europe.</i>		
12.	Russia and Germany	132-01
<i>Lower Western Europe.</i>		
13.	Holland and Belgium	323-94
<i>Mountainous Europe.</i>		
14.	Austria and Switzerland	220-08
15.	France	48-13
16.	Spain and Italy	22-06
	General average from European countries	146-45

The total liabilities, in passing through the acclimating process in New Orleans, in 1853, was to their respective population 60-56.

From this table it will appear, 1st, that liabilities to yellow fever exist (in relation to America) pretty much in proportion to increase of latitude; and, 2dly, by their *cold* moisture, so diametrically opposite in its effects on the constitution to *warm* moisture; and, above all, their personal habits of crowding into cheap and filthy dwellings, and the immigrants being of a low class, and the predominance of intemperance. The comparatively small mortality occurring in those from Great Britain arises from the fact of these immigrants being of a higher class of subjects.

From these remarks it will be seen that life insurance companies in this country must depend in a great measure upon the results of their own experience.

Something, however, has been added to vital statistics by individual States, particularly Massachusetts, New York, Maryland, and Kentucky; and there is no reason why these individual States, as well as the United States, should not have as complete a system of registration of births, marriages, and deaths, as they now have in Great Britain, and thereby give full and accurate statistics of the life and mortality of the country.

The reports of the six life insurance companies of New York, for the year 1857, show that the large sum of \$798,000 has been paid to the representatives of policy holders, and that their aggregate premiums, losses, and assets were severally as follow:

	Prem. and Inter. 1857	Losses. 1857.	Assets. 1857
Mutual Life Ins., N. Y.	\$1,146,000	\$317,000	\$4,488,000
Mutual Benefit Co.	690,000	207,000	2,743,000
N. Y. Life Ins. Co.	474,000	151,000	1,402,000
Manhattan Life Ins. Co.	312,000	57,000	606,000
U. S. Life Ins. Co.	154,000	58,000	430,000
Knickerbocker Ins. Co.	49,000	8,000
Total	\$2,846,000	\$798,000	\$9,669,000

—See *Bankers' Magazine*, 1856-'57; also JONES on *Life Annuities*; LEONE LEVY'S *Com. Law of the World*.

Interest is the annual sum or rate per cent. which the borrower of a capital agrees, or is bound, to pay to the lender for its use. "Interêt; loyer d'un capital prêt; ou bien, en termes plus exacts, achat des services productifs que peut rendre un capital" (*Say*, tom. ii., p. 480, ed. 4me). It was generally supposed, previously to the middle of the last century, that, in the event of all legislative enactments regulating the rate of interest being repealed, its increase or diminution would wholly depend on the comparative scarcity or abundance of money; or, in other words, that it would rise as money became scarce, and fall as it became more plentiful. But this opinion has been successfully controverted, first by Mr. Joseph Massie, in a tract published in 1750, entitled "An Essay on the Governing Causes of the Rate of Interest;" and, second, with better effect in Hume's Essay on Interest, in 1752. And it has been shown that the rate of interest in advanced communities is not determined by the abundance of the currency, but by the average rate of profit derived from the employment of capital. No doubt it most frequently happens that loans are made in currency; but this is of no consequence. There is obviously no substantial difference between A furnishing B with 100 bushels of corn, or 100 yards of cloth, to be repaid at the expiration of a specified period by the delivery of 104 or 105 bushels, or 104 or 105 yards, or with as much money, at 4 or 5 per cent., as would purchase the corn or cloth. And it is easy to perceive that, as crowds of passengers may be successively conveyed by the same carriage, so the same sum of money may serve to negotiate an infinity of loans. Suppose A lends to X \$1000, with which the latter buys from B an equivalent amount of commodities; that B, having no use for the money, lends it to Y, who pays it away for produce to C, who again lends it to Z, and so on. It is plain that X, Y, Z have received loans of commodities or produce from A, B, C worth *three* times (and they might have been worth 30 or 300 times) as much as the money employed in settling the transactions. According as the supply of currency, compared with the business it has to perform, is greater or less, we give a greater or less number of guineas or livres, notes or assignats, for the article we wish to obtain. It is not, however, by the fact of the price of such articles being high or low, but by the advantage or profit which the borrowers expect to derive from their possession, that the interest or compensation to be paid to the lenders for their use is determined. It may, perhaps, be supposed, in the case of goldsmiths and jewelers, that when the quantity of metallic money is increased, they will obtain the raw material of their business with greater facility. But this is not always the case; and though it were, it would not in any degree affect the rate of interest. No coins are ever sent to the melting-pot unless the currency be degraded or depreciated; that is, unless it be deficient in weight, or relatively redundant in quantity. And it is plain that the inducement to offer a high or a low rate of interest for loans of money, which it is intended to work up into plate or other articles, will not depend on the supply of such money, but on the profit to be derived from its conversion into goods—a circumstance wholly unconnected with the scarcity or abundance of coin.

It therefore appears that, speaking generally, the rate of interest depends on the profit that may be made by employing capital in industrious undertakings, and not on the price paid for the articles of which it consists. The latter are affected by every change in the value of money, whereas the former is little, if at all, affected by these changes, and is determined by the productiveness of industry. A low or a high rate of profit is uniformly accompanied by a high or low rate of interest. Money, as every one knows, is cheaper in the United States and in Australia than in England; but the ordinary rate of profit being higher, in-

terest, despite the lower value of money, is also higher. Extraordinary as it may seem, it is nevertheless true, that during the half dozen years ending with 1856, the current rate of interest in San Francisco, where bullion is so very abundant as to be almost a drug, has varied from $1\frac{1}{2}$ to 2 and 3 per cent. a month, or from 18 to 24 and 36 per cent. per annum. And though it were allowed that from a third to a half of this rate should be viewed as a premium to compensate the insecurity prevalent in California, still the residue would amount to three, four, or five times the ordinary rate of interest in England. In further corroboration of these statements we may mention, that the low rate of interest in Holland during the greater part of the 17th and whole of the 18th century, was not owing to any peculiar abundance or cheapness of money, but to the high rate of taxation, and the difficulty of investing capital with profit. And to this latter circumstance we owe the low rate of interest in this country toward the middle of last century, and at several later periods. It is not, in short, by the amount or value of the currencies of different countries, but by the means which they respectively enjoy for the profitable employment of capital or stock, that their profit and interest are governed.

That a rise or fall in the value of money can have no direct influence over interest is plain from the fact of the interest being itself paid in the money that has risen or fallen. But, at the same time, a sudden increase in the supply of money may undoubtedly have a temporary effect in depressing interest. Importers of bullion may not be able to lay it out advantageously in purchases, and may, in consequence, be disposed to have it coined and lent, though at a low rate. We incline, however, to think that the influence of considerations of this sort is but inconsiderable. Lenders will not take less for loans than the borrowers are willing to offer, and the offers of the latter must be determined not merely by the amount of money seeking investments, but partly also, and in a still greater degree, by the profit that may be made by its employment. When there is a rapid influx of money, loans for short periods are usually obtainable at low rates. This, however, is not generally the case with loans for lengthened periods. The lenders are willing to accept a reduced interest for a short term, till they can look about for some more profitable means of investment. But the interest on loans on mortgages, or for lengthened periods, is always proportioned to the rate of profit at the time; and, supposing the security to be unexceptionable, is but little affected by any thing else.

The profits made in industrious undertakings are, for the most part, distributed into *gross* and *net* profits. Thus, if from the total returns, whether annual or otherwise, obtained in any business or employment, we deduct all sorts of outlays necessarily incurred in carrying it on, including the wages or remuneration due to the undertakers for their skill and trouble in superintending the business, and a sum to compensate the risks provided against by insurance, the residue is the *net* profit of, or return to, the capital employed. And it is on this latter portion that interest depends, or rather with which it is usually identical. Lenders having nothing to do with the employment of capital, are not entitled to any peculiar advantage that may arise from it. But they are entitled to all that can fairly be considered as the return to the capital they have lent, after the risks, salaries, and necessary emoluments of those who undertake its employment are deducted; and this much, speaking generally, they will get, and no more. Whatever else may be realized by the employment of capital in industrial pursuits belongs to the borrowers, and forms the fund out of which they are remunerated. In coming to this conclusion, we are supported by the authority of Mr. Tooke. "The rate of interest," says he, "is the

measure of the nett profit on capital. All returns beyond this on the employment of capital are resolvable into compensations, under distinct heads, for risks, troubles, or skill, or for advantages of situation or connection." (Considerations on the State of the Currency, p. 12.) Whatever, therefore, may at any time occasion a sudden glut of money or capital may lower the rate of nett profit and interest. But that very circumstance, by increasing the demand for capital, will eventually raise the rate to its proper level; and the glut having disappeared, profits on interest will depend on the productiveness of industry.

Besides such variations as are proportioned to variations in the ordinary rate of profit, and which equally affect all loans, the rate of interest varies according to the security for the repayment of the principal and the duration of the loan. Hence the powerful influence which the character of the borrower, the purpose for which he borrows, and the nature of the business in which he is engaged, have over interest. Careful, skillful, and intelligent parties always borrow, *ceteris paribus*, on lower terms than those of an opposite description. The spendthrift, the idle, and the unskillful, can with difficulty obtain loans on any terms; and those who deal with them, and stipulate for a high rate of interest to cover their risk, frequently find that their guaranty is inadequate, and that they would have better consulted their own advantage by lending to respectable parties on the usual terms. The nature of the employment in which borrowers are engaged has also, as now stated, a powerful effect in determining the rate of interest. Wherever there is risk, it must be compensated. A sum lent on mortgage over a valuable estate is not exposed to any risk. But a sum lent to a manufacturer or a merchant engaged in a hazardous business, is exposed to a high degree of risk; and the interest payable on the latter, inasmuch as it must include a premium to compensate this extra risk, may be twice or three times as much as that paid on the mortgage.

We should mistake, however, if we supposed that this circumstance places those who carry on particularly hazardous businesses in a comparatively disadvantageous situation. Competition will not permit, taking every thing into account, a greater or a less amount of nett profit to be permanently obtained in one branch of industry than in another. The produce realized by those who engage in employments of more than ordinary hazard is generally sold at prices that yield the ordinary rate of profit, with a surplus sufficient to guaranty their stock against the extra risk to which it is exposed. Were it otherwise, every body would decline placing their property in a state of comparative danger, and undertakings of a hazardous nature would not be entered into. But it very frequently happens, that the manager of a hazardous branch of industry, paying from 10 to 12 per cent. for loans, realizes larger nett profits than the purchaser of an estate with money borrowed at 3 or 4 per cent.

Supposing the security to be equal, capital lent for a fixed and considerable period always fetches a higher rate of interest than that which is lent for short periods, or which may be demanded at the pleasure of the lender. There are but few modes of safely employing loans of which the duration is so uncertain, so that they are frequently worth very little; and hence the rate of interest is, in the majority of cases, in part at least, determined by the length of the loan; for, when that is considerable, it may be productively employed in a variety of businesses, in which it would not otherwise be prudent to invest it, at the same time that the borrower has time to prepare for its repayment. But this principle has only a slight influence over loans for terms beyond three, or, at most, five years; for a loan for either of these terms, but especially the latter, may be employed in a great variety of ways, and would bring nearly as much interest as it

would do were it for 10 or 12 years. It is further to be observed, that large classes of borrowers prefer the less interest which they get for advances at short dates to the higher rate which they might get were they for longer terms. Most people wish to have the full command of their capital. Merchants and manufacturers who lent on mortgage would in so far deprive themselves of the means of extending their business, and of speculating. And though sometimes, perhaps, this might be for their advantage, yet the flattering opinion which most people entertain of their own sagacity and good fortune, would but seldom permit them to doubt that it was a very serious disadvantage. Hence the low rates at which banking companies who pay the sums deposited with them on demand, and governments overwhelmed with debt are able to borrow. A stockholder's mortgage, or claim on the revenue of a country, may be immediately converted into cash at the current prices. And, however much the majority of the creditors of a deeply indebted country may be impressed with a conviction of its inability to discharge the various claims upon it, each individual, confident in his own good fortune and foresight, flatters himself that he, at all events, will foresee the coming tempest, and be able to sell out before a public bankruptcy.

It is evident, from these statements, that in addition to the security for loans and their duration, the rate of interest will, to a considerable extent, depend on the facilities afforded for enforcing or carrying out the stipulations in contracts. And hence a main cause of its reduction as society is more and more improved. Generally, it may be said that a speedy, cheap, and effectual process for securing the payment of debts, has a powerful tendency to lower—and a slow, costly, and ineffectual process, to raise—the rate of interest. In most countries, extraordinary means are taken to compel payment of bills; and this is a principal cause of the low rate at which they are commonly discounted. The easy enforcement of contracts constitutes, in truth, an important portion of the security for a debt. By a good security, is not meant a guaranty that a loan will ultimately be made good, but that it will be punctually paid when due; or, if the loan be of a kind that a little delay in its payment is usually given, that that delay will not be exceeded, and that it will be paid within the customary term. A security which should insure the final payment of a debt, but which should not insure its payment when due, or shortly thereafter, is not a good, but a bad security. It is indispensable to the transacting of business safely, cheaply, and expeditiously, that there should be as little doubt as possible either in regard to the payment of loans or the term when they are to be paid. If either of these points be doubtful, the lender will insist on an indemnity for the consequent risk. And it therefore appears that the summary proceedings taken to enforce payment of bills, and such like debts, are in truth and reality more for the advantage of the borrowers than of the lenders. They reduce the rate of interest; and the hardship, such as it is, which they occasionally inflict on the borrower, does not occur in one case out of five hundred; while their powerful influence in depressing interest tells in every case.

Greece.—In Greece the rate of interest was not regulated by law; and it consequently varied with all the causes of variation above alluded to. Generally, however, it was what we should reckon very high, amounting, in most cases, to from 10 to 18 per cent., and upward. This high rate of interest was not occasioned by a high rate of profit, but by the uncertainty of the laws, and the facilities which they afforded to fraudulent debtors to defeat the just claims of their creditors. The interest on money lent on *bottomry*, or on the security of the ship or cargo, or both, was rated at so much per voyage. It therefore depended on the place to which the ship was to sail, the season of the year,

the chance of meeting pirates or enemies' ships, etc. Usually it was extremely great, varying from 30 to 50 or 60 per cent. The bankers and money-lenders of Athens, though of low origin, being mostly freedmen or aliens, appear to have been considered as eminently trustworthy, and entitled to the public confidence. But they were, notwithstanding, quite as unpopular, and for no better reasons, as the Jews and Lombards of the middle ages. We are surprised that so learned a writer as Boeckh should have been so imbued with the vulgar prejudice against them as to state that they drew upon themselves "the merited hatred of all classes." He should have known that it has not been the covetousness of bankers, but that bad laws administered by interested judges, by making loans insecure, and driving parties of the highest respectability from the banking business, have been alone to blame for the exorbitant usury of ancient as well as of modern times. Had contracts been properly enforced, the probability is that interest would have been as low in Greece as in England.—BOECKH'S *Public Economy of Athens*, vol. i., pp. 164-191.

Attempts to limit the rate of interest have raised it.—Instead, however, of leaving the rate of interest to be adjusted by the free competition of the parties, on the principles thus briefly explained, or endeavoring to reduce it by facilitating the enforcement of contracts, most governments have interfered, either entirely to prohibit the taking of interest, or to fix certain rates which might be legally exacted, while any excess over them was declared to be *usury*, and prohibited under the severest penalties. In the ages in which these enactments had their origin, the precious metals were the only species of money, and were considered quite peculiar. Being used in a double capacity—as standards by which to ascertain the values of different articles, and as the equivalents for which they were most frequently exchanged—they acquired a factitious importance in the estimation, not merely of the vulgar, but of persons of the greatest discernment. The fact, that to buy and to sell is merely to barter one commodity for another, to exchange a quantity of corn, or cloth, or beef, for a quantity of gold or silver, and *vice versa*, was entirely overlooked. The attention was gradually transferred from the money's worth to the money itself. And the wealth of states and of individuals was not measured by the amount of their disposable produce, or by the quantity or value of the articles with which they could afford to purchase the precious metals, but by the quantity or value of these metals actually in their possession. For these and other reasons, money has been considered as a *merchandise par excellence*. And we need not, therefore, be surprised at the measures to which the prevalence of such exaggerated opinions almost necessarily led; or that vigorous efforts should have been made to protect those who were unprovided with so powerful an instrument from becoming a prey to their more fortunate neighbors. Individuals might freely dispose of their corn, cattle, land, etc. But it was supposed that the demand for money might be so great, as to enable the lenders, unless restrained in their exactions, to ruin the borrowers, and engross the whole property of the country.

Another cause of the prejudice against stipulating for interest grew out of the dislike entertained to accumulation. It is a consequence of economy, or of a saving of income; and this, in rude ages, is considered indicative of a sordid disposition, and as being positively hurtful. Prodigals and spendthrifts were long, and perhaps still continue to be, the favorites of the public. Before the nature and functions of capital were properly understood, it was believed that it could not be increased without injury to individuals, and that whatever advantage it might give to one party must occasion an equal disadvantage to others. Our ancestors did not know that those who, by their econ-

omy, accumulate stock, add to their own wealth, without diminishing that of any one else; nor did they know that, when expended, as is almost always the case, in the support of productive industry, this stock affords the means of producing an increased income. But reckoning, as they did, that the savings of individuals were so much withdrawn from income in which the public would otherwise have participated, it was natural enough that they should endeavor to limit the advantage derivable from their employment.

Much, also, of the prejudice against bargaining for interest, prevalent in the middle ages, may be traced to the authority of certain texts of Scripture, which were understood to prohibit its exaction. It is doubtful, however, whether, they will really bear that interpretation. And supposing that they did, nothing could be more irrational than to regard the municipal regulation of a people placed in such peculiar circumstances as the Jews, as general and fixed principles, applicable in all ages and countries. (MICHAELIS *On the Laws of Moses*, vol. ii., 336. English translation.) It is a remarkable fact that the famous reformer Calvin was one of the first to emancipate himself from the prejudices formerly so prevalent, especially among religious people, against taking interest. He comments as follows on the statement of Aristotle, that as money did not produce money, no return could be equitably claimed by the lender:—"Pecunia non parit pecuniam. Quid mare? quid domus, ex cujus locatione pensionem percipio? An ex tactis et parietibus argentum proprie nascitur? Sed et terra producit, et mari advehitur quod pecuniam deinde producat, et habitationis commoditas cum certâ pecuniâ parari commutative solet. Quod si igitur plus ex negotiatione lucri percipi possit, quam ex fundi cujusvis proventu: an feretur qui fundem sterilem fortassè colono locaverit ex quo mercedem vel proventum recipiat sibi, qui ex pecuniâ fructum aliquem perceperit, non feretur? et qui pecuniâ fundum acquirit, annon pecunia illa generat alteram annuam pecuniam? Unde verò mercatores lucrum? Ex ipsis, inquires, diligentia atque industria. Quis dubitet pecuniam vacuum inutilem omnino esse? neque qui à me mutuum rogat, vacuum apud se habere à me acceptam cogitat. Non erga ex pecuniâ illâ lucrum accedit, sed ex proventu. Illa igitur rationes subtiles quidem sunt, et speciem quandam habent, sed ubi propius expenduntur, seipsa concidunt. Nunc igitur concludo judicandum de usuris esse, non ex particulari aliquo Scripturæ loco, sed tantum ex æquitatis regulâ." Quoted by Dugald Stewart in his Notes to his *Preliminary Dissertation to the Encyclopædia Britannica*.

But, whatever may have led to the efforts so generally made to limit or suppress interest, it is abundantly certain that, instead of succeeding in their object, they had an opposite effect. If a borrower consider it for his advantage to offer 6, 7, or 8 per cent. for a loan (and otherwise he would not make the offer), why should the legislature prohibit him from offering, and the lender from receiving, more than 3, 4, or 5 per cent.? An interference of this sort, besides being uncalled for and unnecessary, is in a high degree prejudicial. Restrictive laws, instead of reducing, uniformly raise the rate of interest. They can not be so framed as to prevent borrowers from engaging underhand, to pay a higher rate of interest than is fixed by statute. And if the lenders had implicit confidence in the secrecy and solvency of the borrowers, they might accommodate them with the sums wanted, without requiring any additional interest, because of the illegality of the transaction. But cases of this sort are extremely rare. Gratitude, and a sense of benefits received, are but slender securities for honorable conduct. Numberless unforeseen events occur to weaken and dissolve the best cemented friendships; and a transaction of this kind would afford an additional source of jealousies and divisions. In such

matters, indeed, men are more than usually sharp-sighted, and are little disposed to trust to moral guarantees for the security of their property. But though neither the threatenings of the law, nor the inducements which it held out to dishonest debtors to recede from the stipulations into which they had entered, were able to prevent, or even greatly to lessen, what are termed *usurious bargains*, they rendered them more oppressive. They obliged the lenders to demand, and the borrowers to undertake to pay a rate of interest sufficient to yield the current rate of nett profit at the time, with a further sum to balance the risk of entering into what the law made an illegal transaction. This latter sum being, of course, proportioned to the greater or less magnitude of the risk to be provided against, it increased or diminished according as the laws for the prevention of usury were enforced or relaxed. Whenever, under the old system, the market rate of interest rose above the statutory rate, the free transfer of capital was obstructed. Parties could no longer look merely to their own advantage. And loans which might have been obtained for 6, 7, or 8 per cent., had there been no hazard from anti-usurious statutes, were raised, on its account, to 8, 10, and 12 per cent. It is, therefore, plain that if the means taken to put down usury were not wholly responsible for its existence, they, at all events, added largely to its amount.

These conclusions do not rest on theory only, but are supported by a wide and uniform experience. In Rome, during the republic, the ordinary rate of interest was excessively high. The debtors, or plebeians, were every now and then threatening to deprive their creditors, who were generally of the patrician order, not only of the interest, but of the principal itself. Repeated instances occurred to show that these were not mere empty threats; and the patricians indemnified themselves, by a corresponding premium, for the dangers to which they were exposed. "Des continuelles changements," says Montesquieu, "soit par des loix, soit par des plebiscites, naturaliserent à Rome l'usure; car les créanciers, voyant le peuple leur débiteur, leur législateur, et leur juge, n'eurent plus de confiance dans les contrats. Le peuple, comme un débiteur décrédité, ne tentoit à lui prêter que par des gros profits; d'autant plus que, si les loix ne venoient que de temps en temps, les plaintes du peuple étoient continuelles, et intimidoient toujours les créanciers. Cela fit que tous les moyens honnêtes de prêter et d'emprunter furent abolis à Rome, et qu'une usure affreuse toujours foudroyée, et toujours renaissante, s'y établit. Le mal venoit de ce que les choses n'avoient pas été ménagées. Les loix extrêmes dans le bien font naître le mal extrême: il fallut payer pour le prêt de l'argent, et pour le danger des peines de la loi."—*Esprit des Loix*, liv. xxii., c. 21.

In Mohammedan countries, notwithstanding the prohibition in the Koran, the ordinary rate of interest is at least three or four times as great as its ordinary rate in Europe. "L'usure augmente dans les pays Mahometans à proportion de la sévérité de la défense: le prêteur s'indemnise du péril de la contravention." *Ibid.*, liv. xxi., c. 19. During the middle ages, when interest was excessively high, the rate of profit was probably little, if at all higher than at present. But it should be observed that a very great majority of the loans of these ages were but little influenced by its amount. They were not made to be invested, but to be spent. The great barons and other landed proprietors were the principal borrowers. And in 19 out of every 20 instances, the sums which they borrowed were expended in the maintenance of crowds of idle retainers, in warfare, or in prodigalities of some sort or other. And while the borrowers belonged generally to what we should now call the spendthrift class, and there were no efficient means of compelling them to abide by their engagements, the lenders were but

few in number, and mostly Jews and Italians, the objects of the most unreasonable prejudices. Under such circumstances, it would be folly to suppose that the rate of interest should depend in any considerable degree on the rate of profit. The numbers, position, and character of the borrowers, compared with the fewness, position, and character of the lenders, and the risk to which the latter were exposed in entering into such transactions, occasioned the excessively high rate of interest. Of the 50 and even 100 per cent. which borrowers then frequently engaged to pay as interest, not more than 10 or 12 per cent. can properly be said to have been given for the productive services of loans. The rest must be considered as occasioned partly by the extreme scarcity of disposable capital and the carelessness of the borrowers, and partly, and principally, as a *bonus* to compensate the lenders for the imminent hazard of losing the principal.

England.—In England, as in most other countries, Christians were, after the Conquest, absolutely prohibited, both by the civil and the ecclesiastical law, from bargaining for interest. But as Jews, according to the Mosaic law (*Deuteronomy*, chap. xxiii., v. 20), were allowed to lend at an interest to a stranger, its exaction by them was first connived at, and subsequently authorized by law. And the same privilege was afterward extended to the Italian or Lombard merchants. In consequence of this exemption, many Jews early settled in England, and engrossed a large share of the trade of the kingdom. But despite their industry and general good conduct, the prejudices against them, and against the business in which they were mostly engaged, were so very strong that they and their families were regarded as slaves of the crown, by whom they were plundered, to an extent and under pretenses which would now appear incredible. To such an extreme, indeed, were these oppressive practices carried, that a particular office, called the *exchequer of the Jews*, was established, for receiving the sums extorted from them in fines, customs, tallages, forfeitures, etc. They were, in consequence, obliged to charge an enormous rate of interest, or, as Madox expresses it, "to fleece the subjects of the realm as the king fleeced them." (*Madox's History of the Exchequer*, vol. i., pp. 221–261, 4to, 1769.) And hence, while only from 7 to 10 and 12 per cent. interest was paid in countries where sounder principles prevailed, the rate charged in England was 3, 4, and even 5 times as great. At Verona, in 1228, the interest of money was fixed by law at 12½ per cent. Toward the end of the 14th century, the republic of Genoa paid only from 7 to 10 per cent. to her creditors; and the average discount on good bills at Barcelona, in 1435, is stated to have been about 10 per cent. But while interest in Italy and Catalonia, where a considerable degree of freedom was allowed to the parties bargaining for a loan, was thus comparatively moderate, it was, despite its total prohibition, incomparably higher in France and England. Matthew Paris mentions that, in the reign of Henry III., the debtor paid 10 per cent. every two months. And this, though impossible as a general practice, may not have been very far from the average interest charged on the few loans that were then contracted for. (*Hallam's Middle Ages*, vol. iii., p. 402.)

But in the end the disorders occasioned by this ruinous system became so obvious, that, notwithstanding the deeply-rooted prejudices to the contrary, a statute was passed in 1546 (37 Hen. VIII., cap. 7), legalizing interest to the extent of 10 per cent. per annum; because, as is recited in the words of the act, the statutes "prohibiting interest altogether have so little force, that little or no punishment hath ensued to the offenders." In the reign of Edward VI., the horror against interest seems to have revived in full force; for, in 1552, the taking of any was again prohibited, "as a vice most odious and detestable," and "contrary

to the word of God." But, in spite of this denunciation, the rate of interest, instead of being reduced, immediately rose to 14 per cent., and continued at this rate until, in 1571, an act was passed (13th Eliz., cap. 8), repealing the act of Edward VI., and reviving the act of Henry VIII., allowing 10 per cent. interest. In the preamble to this act it is stated, "That the prohibiting act of King Edward VI. had not done so much good as was hoped for; but that rather the vice of usury hath much more exceedingly abounded, to the utter undoing of many gentlemen, merchants, occupiers, and others, and to the importable hurt of the commonwealth." This salutary statute was opposed, even by those who should have known better, with all the violence of superstitious fanaticism. Dr. John Wilson, a man famous in his day, and celebrated for the extent of his learning, informed the House of Commons, of which he was a member, that "it was not the amount of the interest taken that constituted the crime; but that all lending for any gain, be it ever so little, was wickedness before God and man, and a damnable deed in itself, and that there was no mean in this vice any more than in murder or theft." To quiet the consciences of the bishops, a clause was inserted, declaring usury to be forbidden by the law of God, and to be in its nature sin, and detestable. This statute was limited to a period of five years; but, "forasmuch as it was, by proof and experience, found to be very necessary and profitable for the commonwealth of this realm," it was, in the same reign, made perpetual (39th Eliz., cap. 18).

In the 21st of James I., the legal rate of interest was reduced to 8 per cent., by an act to continue for seven years only, but which was made perpetual in the succeeding reign (3d Car. I., cap. 4). During the Commonwealth, the legal rate of interest was reduced to 6 per cent., a reduction which was afterward confirmed by the 12th Car. II. And, finally, in the reign of Queen Anne, a statute (12th Anne, cap. 16) was framed, reducing the rate of interest to 5 per cent., at which it stood till 1839. In the preamble to this statute, it is stated that, "whereas, the reducing interest to 10, and from thence to 8, and thence to 6, in the hundred, hath from time to time, by experience, been found very beneficial to the advancement of trade and the improvement of lands, it is become absolutely necessary to reduce the high rate of interest of 6 per cent. to a nearer proportion to the interest allowed for money in foreign States." It was for these reasons enacted, that all bargains or contracts stipulating for a higher rate of interest than 5 per cent. should be utterly void. And "that all persons who should after that time receive, by means of any corrupt bargain, loan, exchange, cheivance, or interest, of any wares, merchandise, or other thing whatever, or by any deceitful way or means, or by any covin, engine, or deceitful conveyance for the forbearing or giving day of payment, for one whole year, for their money or other thing, above the sum of £5 for £100 for a year, should forfeit, for every such offense, the treble value of the moneys or other things so lent, bargained," etc.

Scotland and Ireland.—In Scotland previous to the Reformation, no interest could be legally charged. But that great event, by weakening the force of those religious prejudices which had chiefly dictated the prohibition of interest, led to the adoption of more liberal opinions on the subject, and to the enactment of the statute of 1587 (11th Parl., Jac. VI. cap. 52), which legalized interest to the extent of 10 per cent. In 1633 the legal rate was reduced to 8 per cent., and in 1661 to 6 per cent. The statute of Anne, reducing the rate of interest to 5 per cent., extended to both kingdoms. The statutes prohibiting the taking of interest in Ireland were not repealed until 1635, when the statute 10th Car. I., cap. 22, gave liberty to stipulate for any rate not exceeding 10 per cent. In 1704 this rate was reduced to 8 per cent.; in 1722 it

was reduced to 7 per cent.; and in 1732 it was further reduced to 6 per cent.

France.—In France the rate of interest was fixed at 5 per cent. so early as 1665; and this, a few short intervals only excepted, continued to be the legal rate till the Revolution. Laverdy, in 1766, reduced it from 5 to 4 per cent. Instead, however, of the market rate being proportionally reduced, it was raised from 5 to 6 per cent. Previously to the promulgation of the edict, loans might have been obtained on good security at 5 per cent.; but an additional per cent. was afterward required to cover the illegality. This caused the speedy abandonment of the measure.* The same thing happened in Livonia in 1786, when the Empress Catherine reduced interest from 6 to 5 per cent. Hitherto, says Storch (*in loco citato*), those who had good security to offer were able to borrow at 6 per cent.; but thenceforth they had to pay 7 per cent. or upward. And such will be found to be invariably the case, when the legal is less than the market rate of interest.

It has been observed by Adam Smith, that the statutory regulations, reducing interest in England, were made with great propriety. Instead of preceding, they followed the fall which was gradually taking place in the market rate of interest, and, therefore, did not contribute, as they would otherwise have done, to raise that which they were intended to reduce. Sir Josiah Child, whose treatise, recommending a reduction of interest to 4 per cent., was originally published in 1668,† states, that the goldsmiths of London, who then acted as bankers, could obtain as much money as they pleased, upon their servants' notes only, at 4½ per cent. The supposed insecurity of the revolutionary establishment, and the novelty of the practice of funding, occasioned the payment of a high rate of interest for a large portion of the sums borrowed by the public in the reigns of William III. and Anne. But private persons, of undoubted credit, could then borrow at less than 5 per cent. During the reign of George II. the market rate of interest fluctuated from 3 to 4 and 4½ per cent.‡ Smith mentions that the increased means of profitably investing capital acquired during the war, terminated by the peace of Paris in 1763, raised the market rate of interest to a level with the statutory rate, or perhaps higher. But it was not until the subsequent European war that any very material or general inconvenience was found to result from the limitation of interest to 5 per cent.

It is necessary, however, to observe, that this remark applies exclusively to loans negotiated by individuals who could offer unexceptionable security; for, since the act of 1714, persons engaged in employments of more than ordinary hazard, or whose character for prudence and punctuality did not stand high, or who could only offer inferior security, were unable to borrow at 5 per cent., and were consequently compelled to resort to a variety of schemes for defeating or evading the enactments in the statute. The most common device was the sale of an annuity. Thus, supposing an individual whose personal credit was indifferent, and who had only the life-rent of an estate to give in security, wished to borrow, he sold an annuity to the lender sufficient to pay the interest stipulated for, which, because of the risks and odium attending such transactions, was always higher than the market rate, and also to pay the premium necessary to insure payment of the principal at the death of the borrower. It is curious to observe, that though the sale of an ir-

† A second edition, very greatly enlarged, was published in 1690.

‡ On the 18th December, 1752, the 3 per cents. brought the highest price they have hitherto reached, namely, 106½ per cent. On the 20th of September, 1797, the day on which the failure of Lord Malmesbury's attempt to negotiate with the French republic transpired, consols fell to 47½, being the lowest price at which they have ever been sold.

redeemable life annuity, at a rate exceeding legal interest, was not reckoned fraudulent or usurious, yet, so late as 1748, Lord Hardwicke held that, in their less exceptionable form, or when they were *redeemable*, their sale could be looked upon in no other light than as an invasion of the statute of usury, and a loan of money.* But the extreme inexpediency of this distinction soon became obvious, and the law was changed. The great extension of the traffic in annuities, and the advantage of giving as much publicity as possible to such transactions, led to various inquiries and regulations respecting them in the early part of the reign of George III. In consequence, the sale of irredeemable annuities became nearly unknown; and it was ruled, that the sale of a redeemable annuity could not be impeached, though it appeared on the face of the deeds that the lender had secured the principal by effecting an assurance of the borrower's life.

During the greater part of the French revolutionary war, the usury laws operated to the prejudice of all classes of borrowers. The greater extent and high interest of the public loans, the facility of selling out of the funds, the regularity with which the dividends were paid, and the temptations to speculation arising from the fluctuations in the price of funded property, diverted so large a portion of the floating capital of the country into the coffers of the treasury, that it was next to impossible for private individuals to borrow at the legal rate of interest, except from the trustees of public companies, or through the influence of circumstances of a very peculiar nature. Hence, the proprietors of unencumbered freehold estates, of which they had the absolute disposal, were very generally obliged, when they had occasion for loans, to resort to those destructive expedients which had formerly been the resource only of spendthrifts and persons in desperate circumstances.

Committee on Usury Laws.—The evidence annexed to the "Report of the Committee of the House of Commons, in 1818, on the Usury Laws," sets their impolicy and pernicious influence in a clear light. Mr. Sugden, now Lord St. Leonard, stated that when the market rate of interest was above the legal rate, the landed proprietor was compelled to resort to some shift to evade the usury laws. He had "known annuities granted for three lives, at 10 per cent., upon fee-simple estates, unencumbered, and of great annual value, in a register county. He had also known annuities granted for four lives; and more would have been added, but for the danger of equity setting aside the transaction on account of the inadequacy of the consideration. Latterly, many annuities were granted for a term of years certain, not depending upon lives." On being asked whether, were there not laws limiting the rate of interest, better terms could or could not have been obtained, he answered, "I am decidedly of opinion that better terms could have been obtained; for there is a stigma which attaches to men who lend money upon annuities, that drives all respectable men out of the market. Some leading men did latterly embark in such transactions, but I never knew a man of reputation in my own profession lend money in such a manner, although we have the best means of ascertaining the safest securities, and of obtaining the best terms."

"The laws against usury," says Mr. Holland, of the house of Messrs. Baring Brothers and Company, "drive men in distress, or in want of money, to much more disastrous modes of raising it than they would adopt if no usury laws existed. The man in trade, in want of money for an unexpected demand, or disappointed in his returns, must fulfill his engagements, or forfeit his credit. He might have borrowed money at 6 per cent., but the law allows no one to lend it to

him; and he must sell some of the commodity he holds, at a reduced price, in order to meet his engagements. For example, he holds sugar which is worth 80s.; but he is compelled to sell it immediately for 70s. to the man who will give him cash for it, and thus actually borrows money at 12½ per cent, which, had the law allowed him, he might have borrowed from a money dealer at 6 per cent. It is known to every merchant that cases of this kind are common occurrences in every commercial town, and more especially in the metropolis. A man in distress for money pays more interest, owing to the usury laws, than he would if no such laws existed; because now he is obliged to go to some of the disreputable money-lenders to borrow, as he knows the respectable money-lender will not break the laws of his country. The disreputable money-lender knows that he has the ordinary risk of his debtor to incur in lending his money, and he has further to encounter the penalty of the law, for both of which risks the borrower must pay. If no usury laws existed, in common cases, and where a person is respectable, he might obtain a loan from the respectable money-lender, who would then only have to calculate his ordinary risk, and the compensation for the use of his money."

The committee admitted the force of this evidence by agreeing to the following resolutions: "1st. That it is the opinion of this committee, that the laws regulating or restraining the rate of interest have been extensively evaded, and have failed of the effect of imposing a maximum on such rate; and that, of late years, from the constant excess of the market rate of interest above the rate limited by law, they have added to the expense incurred by borrowers on real security, and that such borrowers have been compelled to resort to the mode of granting annuities on lives; a mode which has been made a cover for obtaining a higher rate of interest than the rate limited by law, and has further subjected the borrowers to enormous charges, or forced them to make very disadvantageous sales of their estates. 2d. That it is the opinion of this committee, that the construction of such laws, as applicable to the transactions of commerce as at present carried on, have been attended with much uncertainty as to the legality of many transactions of frequent occurrence, and consequently been productive of much embarrassment and litigation. 3d. That it is the opinion of this committee, that the present period, when the market rate of interest is below the legal rate, affords an opportunity peculiarly favorable for the repeal of the said laws."

In spite, however, of the recommendation of the committee, and the cogent evidence on which it was founded, the popular prejudice continued so strong, that it was not till 1859 that a statute was passed, the 2d and 3d Vict., cap. 87, which exempted all bills of exchange and promissory notes, not having more than twelve months to run, and all contracts for sums above £10 from the operation of the usury laws. It was supposed, or at all events argued, that the repeal of the usury laws would tempt such individuals as had money to lend, to indulge in those mean and discreditable practices which characterize the lowest class of money-dealers. But it was more reasonably contended, that in the event of the rate of interest being left to be adjusted by the free competition of the parties, there would be little employment for inferior dealers. Except when the market rate of interest was below the legal rate, the usury laws prevented all persons, whose credit was not extremely good, from obtaining loans from capitalists of the highest character, and forced them to have recourse to those who were less scrupulous. Supposing the market rate of interest to be 6 or 7 per cent., an individual in ordinarily good credit may, now that the usury laws are abolished, easily obtain a loan at that rate. But when the law declared that no more than 5 per cent. should be

* "Considerations on the Rate of Interest," by E. B. Sugden, Esq., Pamphleteer, vol. viii., p. 278.

taken, and, consequently, affixed a species of stigma to those lenders who bargained for a higher rate, the rich and more respectable capitalists being excluded from the market, borrowers were obliged to resort to those of an inferior character, who, in addition to the premium for the risk of entering into an illegal transaction, received an indemnification for the *odium* which, in such cases, always attaches to the lender. It is idle to attempt to secure individuals against the risk of imposition in pecuniary more than in any other species of transactions. And, although the object had been desirable, it could not be obtained by such inadequate means. The usury laws generated the very mischief they were intended to suppress. Instead of diminishing, they multiplied usurious transactions, and aggravated the evils they were designed to mitigate or remove.

Nothing can be more unreasonable than the clamor against money-lenders, because of their exacting a comparatively high rate of interest from prodigals and spendthrifts. This is the most proper and efficient check that can be put upon extravagance. Supposing the security of a prodigal and an industrious man to be nearly equal, and this is but seldom the case, the capitalist who lends to the latter in preference to the former, confers a service on the community. He prevents those funds which ought to be employed in supporting useful labor, and in adding to the public wealth, from being wasted in frivolous or pernicious pursuits.

But perhaps it will be said that this is mistaking the object of the usury laws; that they were not intended to force capitalists to lend to spendthrifts on the same terms as to industrious persons, but to protect the prodigal and unwary from the extortion of usurers, by making any stipulation between them for more than a given rate of interest null and void. But why all this solicitude about the least valuable class of society? Why fetter the circulation of capital among those who would turn it to the best account, lest any portion of it chance to fall into the hands of those who would squander it away? If the prevention of prodigality be of sufficient importance to justify the interference of the legislature, prodigals should be put under an *interdict*; for this is the only way in which it is possible to restrict them. It is not by borrowing money at high interest, but by contracting debts to dealers, on whose charge there is no check, that spendthrifts run through their fortunes. Bentham has justly observed, that so long as a man is looked upon as one who will pay, he can much more easily get the goods he wants than the money to buy them with, though he were content to give for it twice or three times the ordinary rate of interest. How contradictory, then, to permit prodigals to borrow (for it was really borrowing) the largest supplies of food, clothes, etc., at 20, 30, or even 100 per cent. interest, at the same time that we prohibited them, and every one else, from borrowing money at more than 5 per cent.? Instead of being of any service, this restriction was evidently injurious to the prodigal. It narrowed his choice, and drove him to a market where no disgrace is attached to the exaction of the most exorbitant interest, and where he could scarcely escape being ruined.

The outcry which is sometimes raised against capitalists for taking advantage of the necessities of industrious individuals, is seldom much better founded than that which is raised against them for taking advantage of the prodigal or simple. Parties borrow according to their character for sobriety, and punctuality in meeting their engagements, and according to the presumed state of their affairs at the time. To say that a capitalist takes advantage of the necessities of individuals, is, in most cases, equivalent to saying that he refuses to lend to persons in suspicious or necessitous circumstances on the same terms he would do were they in good credit, or were there no doubt of their

solvency. And were he to act otherwise, would he be considered fit to be intrusted with the management of his affairs?

But, as already seen, whatever may be the extortion of lenders, the usury laws did not check it. On the contrary, they compelled the borrowers to pay, over and above the common rate of interest, a *premium* to indemnify the lenders for the risks incurred in breaking them. They attempted to remedy what was not an evil, and what, consequently, should not have been interfered with; and in doing this, they necessarily created a real grievance. The wisdom of an act of Parliament which should compel the underwriters to insure a gunpowder magazine and a salt warehouse on the same terms, would not be very evident. Yet it would not be more absurd than to enact that the same rate of interest shall be charged on capital lent on good, on indifferent, and on bad securities. "It is in vain, therefore," to use the words of Locke, "to go about effectually to reduce the price of interest by law, and you may as rationally hope to set a fixed rate upon the hire of houses or ships, as of money. He that wants a vessel rather than lose his market, will not stick to have it at the market rate, and find means to do it with security to the owner, though the rate were limited by law; and he that wants money, rather than lose his voyage or his trade, will pay the natural interest for it, and submit to such ways of conveyance as shall keep the lender out of reach of the law." ("Considerations of the lowering of interest and raising the value of money, 1691," works, vol. ii., p. 7, 4to, 1777.) The case of Holland furnishes a striking proof of the correctness of the theory we have been endeavoring to establish. The rate of interest has been, for a very long period, lower in Holland than anywhere else in Europe; and yet it is the only country in which usury laws have been altogether unknown, where capitalists are allowed to demand, and borrowers to pay, any rate of interest. Strictly speaking, this applies only to the state of Holland previously to the revolution in 1795. The enactments of the Code Napoleon were subsequently introduced; but it appears, from the report of the Parliamentary Committee on the usury laws, that they have not been acted upon. Notwithstanding all the violent changes of the government, and the extraordinary disturbance of her financial concerns since 1790, the rate of interest in Holland has continued comparatively steady. During the whole of that period, persons who could offer unexceptionable security have been able to borrow at from 2 to 5½ per cent.; nor has the average rate of interest charged on capital advanced on the worst species of security ever exceeded 6 or 7 per cent., except when the government was negotiating a forced loan. But, in this country, where the law declared that no more than 5 per cent. should be taken, the rate of interest for money advanced on the best landed security varied, in the same period, from 5 to 16 or 17 per cent., or above five times as much as in Holland.

In France the usury laws were abolished at the Revolution; and it is stated that their abolition was not attended by any rise of interest.—STORCH, *Economie Politique*, tom. iii., p. 187. According to the Code Napoleon, only 6 per cent. is allowed to be charged on commercial loans, and 5 per cent. on those made on the security of real property. There is, however, no difficulty in evading the law. This is usually done by giving a *bonus* before completing the transaction, or, which is the same thing, by framing the obligation for the debt for a larger sum than is really advanced by the lender. None of the parties particularly interested can be called to swear to the fact of such *bonus* being given; so that the transaction is unimpeachable, unless a third party, privy to the settlement of the affair, be produced as a witness.—E.B. The reader is referred to M'CULLOCH'S *Essay on Interest and Exchange*, pub. in *Bankers' Mag.*, New York.

TABLES OF INTEREST AND ANNUITIES.

In Hamburg the rate of interest is quite unrestricted; or, if there be a written law restraining it, it has become obsolete. The rate, therefore, varies according to circumstances. Occasionally it has been at 7, 8, and even 10 per cent.; and in 1799, a period of great mercantile embarrassment and insecurity, it was as high as 14 per cent. Generally, however, the rate of discount on good bills does not exceed 3 or 4 per cent.—*Report on Usury Laws*, p. 46.

In Russia the legal rate of interest is 6 per cent. But as Russia is a country capable of much improvement, and where there are very great facilities for the advantageous employment of capital, the market rate of interest is invariably higher than the statute rate, and the law is constantly and easily evaded.—*Report on Usury Laws*, p. 46; and *Storch*, tom. iii., p. 207.

The previous statements apply only to the cases of interest arising out of loans made by one party to another. But there are cases in which interest may become due without being stipulated for, by unnecessary or unjustifiable delays in the payment of debts, or by trustees, agents, or other parties coming into possession of property belonging to others, etc., and in these it is necessary to obviate litigation, that the interest to be charged should be fixed by law. This legal rate had better be somewhat below the ordinary market rate, and may be adjusted from time to time as circumstances may require. But, except in cases of this sort, there is no more reason for interfering to regulate the rate of interest, than there is for interfering to regulate premiums of insurance.

Distinction of Simple and Compound Interest.—When a loan is made, it is usual to stipulate that the interest upon it should be regularly paid at the end of every year, half year, etc. A loan of this sort is said to be at simple interest. It is of the essence of such loan that no part of the interest accruing upon it should be added to the principal to form a new principal; and though payment of the interest were not made when it becomes due, the lender would not be entitled to charge interest upon such unpaid interest. Thus, suppose \$100 were lent at simple interest at 5 per cent., payable at the end of each year; the lender would, at the end of three or four years, supposing him to have received no previous payments, be entitled to \$15 or \$20, and no more.

Compound Interest.—Sometimes, however, money or capital is invested so that the interest is not paid at the periods when it becomes due, but is progressively added to the principal; so that at every term a new principal is formed, consisting of the original principal and the successive accumulations of interest upon interest. Money invested in this way is said to be placed at *compound interest*. It appears only reasonable, when a borrower does not pay the interest he has contracted for at the period when it is due, that he should pay interest upon such interest. This, however, is not allowed by the law of England; nor is it allowed to make a loan at compound interest. But this rule is easily evaded by taking a new obligation for the principal with the interest included, when the latter becomes due. Investments at compound interest are also very frequent. Thus, if an individual buy into the funds, and regularly buy fresh stock with the dividends, the capital will increase at compound interest; and so in any similar case.

Calculation of Interest.—Interest is estimated at so much per cent. per annum, or by dividing the principal into 100 equal parts, and specifying how many of these parts are paid yearly for its use. Thus 5 per cent., or 5 parts out of 100, means that \$5 are paid for the use of \$100 for a year, \$10 for the use of \$200, \$2 50 for the use of \$50 for the same period, and so on.

Many attempts have been made to contrive expeditious processes for calculating interest. The following is one of the best: Suppose it were required to find the interest upon \$172 for 107 days at 5 per cent.

This forms what is called in arithmetical books a double rule of three question, and would be stated as follows:

$L. \text{ Days. } L. \quad L. \text{ Days.}$

$100 \times 365 : 5 :: 172 \times 107 = \text{the interest required.}$

Hence to find the interest of any sum for any number of days at any rate per cent., multiply the sum by the number of days, and the product by the rate, and divide by 36,500 (365×100); the quotient is the interest required. When the rate is 5 per cent., or 1-20th of the principal, all that is required is to divide the product of the sum multiplied by the days by 7300 (365, the days in a year, multiplied by 20). Five per cent. interest being found by this extremely simple process, it is usual in practice to calculate 4 per cent. interest by deducting 1-5th; 3 per cent. by deducting 2-5ths; 2½ per cent. by dividing by 2; 2 per cent. by taking the half of 4, and so on.

In calculating interest upon accounts current, it is requisite to state the number of days between each receipt or payment, and the date (commonly the 31st of December) to which the account current is made up. Thus, \$172 paid on the 15th of September, bearing interest to the 31st of December, 107 days. The amount of such interest may, then, be calculated as above explained, or by the aid of tables.

The 30th of June is, after the 31st of December, the most usual date to which accounts current are made up, and interest calculated. It is desirable, in calculating interest on accounts current, to be able readily to find the number of days from one day in any month to any day in any other month. This may be done with the greatest ease by means of the following table:

TABLE FOR ASCERTAINING THE NUMBER OF DAYS FROM ANY ONE DAY IN THE YEAR TO ANY OTHER DAY.

	Jan.	Feb.	March.	April.	May.	June.	July.	August.	Sept.	Oct.	Nov.	Dec.
1	32	60	91	121	152	182	213	244	274	305	335	
2	33	61	92	122	153	183	214	245	275	306	336

30	..	89	120	150	181	211	242	273	303	334	364	
31	..	90	..	151	..	212	243	..	304	..	365	

By this table may be readily ascertained the number of days from any given day in the year to another. For instance, from the 1st of January to the 14th of August (first and last days included), there are 226 days. To find the number, look down the column headed January, to No. 14, and then look along in a

parallel line to the column headed August, you find 226, the number required. To find the number of days between any other two given days, when they are both after the first of January, the number opposite the first day must, of course, be deducted from that opposite to the second. Thus, to find the number of days between the 18th of March and the 19th of August, deduct from 281—the number in the table opposite to 19 and under August—72, the number opposite to 18 and under March, and the remainder, 159, is the number required, last day included. In leap years, one must be added to the number after the 28th of February.

When interest, instead of being simple, is compound, the first year's or term's interest must be found, and being added to the original principal, makes the principal upon which interest is to be calculated for the second year or term; and the second year's or term's interest being added to this last principal, makes that upon which interest is to be calculated for the third year or term; and so on for any number of years. But when the number of years is considerable, this process becomes exceedingly cumbersome and tedious, and to facilitate it tables have been constructed, which are subjoined to this article.

The first of these tables (p. 1074) represents the amount of \$1 accumulating at compound interest, at 3, 3½, 4, 4½, up to 10 per cent. every year, from 1 year to 85 years, in dollars and decimals of a dollar. Now, suppose that we wish to know how much \$500 will amount to in seven years at 4 per cent. In the column marked 4 per cent., and opposite to 7 years, we find \$1.31.5931, which shows that \$1 will, if invested at 4 per cent., compound interest, amount to \$1.31.5931 in 7 years; and, consequently, \$500 will, in the same time, and at the same rate, amount to $500 \times 1.31.5931$, or \$657.96.6. For the same purpose of facilitating calculation, the present value of \$1 due any number of years hence, not exceeding 85, at 3, 3½, 4, 4½, up to 10 per cent., compound interest, is given in the tables, pp. 1074–1077. The use of these tables is precisely similar to the one above. Let it, for example, be required to find the present worth of \$500 due 7 years hence, reckoning compound interest at 4 per cent.; opposite to 7 years, and under 4 per cent., 75.291781, the present worth of \$1 due at the end of 7 years; and multiplying this sum by \$500, the product being \$379.95.89, is the answer required. These tables are in part from *Tables of Interest, Discount, and Annuities*, by JOHN SMART, Gent., 4to., London, 1726. They are carried to eight decimal places, and enjoy the highest character in England and on the Continent, for accuracy and completeness. The original work is now become scarce.

ANNUITIES. 1. *Annuities certain.*—When a sum of money is to be paid yearly for a certain number of years, it is called an annuity. The annuities usually met with are either for a given number of years, which are called *annuities certain*; or they are to be paid so long as one or more individuals shall live, and are thence called *contingent annuities*.

By the amount of an annuity at any given time, is meant the sum to which it will then amount, supposing it to have been regularly improved at compound interest during the intervening period.

The present value of an annuity for any given period, is the sum of the present values of all the payments of that annuity.

See JONES on *Annuities*, London, 2 vols., 8vo; *Ency. Brit.*, 8th ed.; *BANKERS' Mag.*, vols. v., vi., vii., New York, 1854–1857; J. R. McCULLOCH, *Essays on Exchange, Interest, &c.*, New York, 1857; *Assurance Magazine*, London, 1854–1857; *Report to British Parliament on Usury Laws*; STORCH, *Economie Politique*, iii.; MADOX, *History of the Exchequer*; *Considerations on the State of the English Currency*; HUME's *Essay on Interest*; *Essay on the Governing Causes of the Rate of Interest*.

The uses of these tables are numerous, and they are easily applied. Suppose, for example, it were required to tell the amount of an annuity of \$50 a year for 17 years, at 4 per cent., compound interest.

Opposite to 17 (Table, p. 1074) in the column of years, and under 4 per cent., is 23.69751,239, being the amount of an annuity of \$1 for the given time at the given rate per cent.; and this multiplied by 50 gives \$1184.87.56195, the amount required.

Suppose, now, that it is required what sum one must pay down to receive an annuity of \$50, to continue for 17 years, compound interest at 4 per cent.?

Opposite to 17 years (Table, p. 1076) and under 4 per cent., is 12.16566,886, the present value of an annuity of \$1 for the given time and at the given rate per cent.; and this multiplied by 50, gives \$608.28.3443, the present value required.

When it is required to find the time which must elapse, in order that a given sum, improved at a specified rate of compound interest, may increase to some other given sum, divide the latter sum by the former, and look for the quotient, or the number nearest to it, in table No. I., under the given rate per cent., and the years opposite to it are the answer: thus,

In what time will \$523 amount to \$1087.27.94, at 5 per cent., compound interest?

Divide 1087.27.94, etc., by 523, and the quotient will be 2.0789, etc., which under 5 per cent. in table I., is opposite to 15 years, the time required.

If it had been required to find the time in which a given annuity, improved at a certain rate of compound interest, would have increased to some given sum, the question would have been answered by dividing, as above, the given sum by the annuity, and looking for the quotient (not in table No. I., but) in table No. III., under the given rate per cent., it would be found on a line with the time required; thus,

A owes \$1000, and resolves to appropriate \$10 a year of his income to its discharge; in what time will the debt be extinguished, reckoning compound interest at 4 per cent.?

1000 divided by 10 gives 100, the number in table No. III. under 4 per cent., and nearest to this quotient is 99.8265, etc., opposite to 41 years, the required time. Had the rate of interest been 5 per cent., the debt would have been discharged in somewhat less than 37 years. This example is given by Dr. Price (*Annuities*, 6th ed., vol. ii., p. 289); and on this principle the whole fabric of the sinking fund was constructed. Of the abstract truth of the principle there can not, indeed, be a doubt. But every thing depends on the increasing sums annually produced being immediately invested on the same terms; and this, when the sum is large, and the period long, is altogether impracticable.

Let it next be required to find an annuity which, being increased at a given rate of compound interest during a given time, will amount to a specified sum: in this case we divide the specified sum by the amount of \$1 for the time and rate given, as found in the Table III., and the quotient is the answer.—Thus, What annuity will amount to \$1,087.27.94 in 15 years at 5 per cent. compound interest? Opposite to 15 years in Table III., and under 5 per cent., is 21.5785, etc., the amount of \$1 for the given time and rate; and dividing 1087.27.94, etc., by this sum, the quotient 50.887, etc., is the annuity required. *Deferred annuities* are those which do not commence till after a certain number of years; and *reversionary annuities*, such as depend upon the occurrence of some uncertain event, as the death of an individual, etc. The present value of a deferred annuity is found by deducting, from the value of an annuity for the whole period, the value of an annuity to the term at which the reversionary annuity is to commence.—Thus, What is the present value of an annuity of \$50 to continue for 25 years, commencing at 7 years from the present time,

interest at 4 per cent. ? According to Table No. IV., the value of an annuity of \$1 for 25 years at 4 per cent. is 15.62207,995, and that of \$1 for 7 years is 6.00205,467, which being deducted from the other, leaves 9.62002,528, which multiplied by 50 gives \$481, the answer required. Supposing the annuity, instead of being for 25 years, had been a perpetuity, it would have been worth \$1,250, from which deducting \$300 10c., the value of an annuity for 7 years at 4 per cent., there remains \$949.90, the value of the reversion. For a selection of problems that may be solved by Table of annuities certain, see SMART'S *Tables*, pp. 20-109.

2. *Life Annuities.*—After what has been stated in the article on INSURANCE (GENERAL PRINCIPLES OF), respecting tables of mortality, it will be easy to see how the value of a life annuity is calculated. Supposing—to revert to the example given before INSURANCE, that it were required to find the present value of \$1, the receipt of which is dependent on the contingency of a person, now 56 years of age, being alive 10 years hence, taking the Carlisle table of mortality, and interest at 4 per cent.: Now, according to that table, of 10,000 persons born together, 4000 attain to 56, and 2894 to 66 years of age. The probability that a person, now 56 years, will be alive 10 years hence, is, consequently, 2894 : 4000; and the present value of \$1, to be received certain 10 years hence being \$0.675564, it follows, that if its receipt be made to depend on a life 56 years of age, attaining to 66 years, its value will be reduced by that contingency to $2894 \times \$0.675564 = \0.48877 . If, then, we had to find the present value of an annuity of \$1, secured on the life of a person now 56, we should calculate in this way the present value of each of the 48 payments, which, according to the Carlisle table, he might receive, and their sum would, of course, be the present value of the annuity.

This statement is enough to show the principle on which all calculations of annuities depend; and this also was, in fact, the method according to which they were calculated, till Mr. Simpson and M. Euler invented a shorter and easier process, deriving from the value of an annuity at any age, that of an annuity at the next younger age. There is a considerable discrepancy in the sums at which different authors, and different insurance offices, estimate the present value of life annuities payable to persons of the same age. This does not arise from any difference in the mode of calculating the annuities, but from differences in the tables of mortality employed. These can only be accurate when they are deduced from multiplied and careful observations made, during a long series of years, on a large body of persons; or when the average numbers of the whole population, and of the deaths at every age, for a lengthened period, have been determined with the necessary care. It is to be regretted, that governments who alone have the means of ascertaining the rate of mortality by observations made on a sufficiently large scale, have been singularly inattentive to their duty in this respect. And until a very few years since, when Mr. Finlayson was employed to calculate tables of the value of annuities from the ages of the nominees in public tontines, and of individuals on whose lives government had granted annuities, all that had been done in this country to lay a solid foundation on which to construct the vast fabric of life insurance, had been the work of a few private persons, who had, of course, but a limited number of observations to work upon.

The celebrated mathematician, Dr. Halley, was the first who calculated a table of mortality, which he deduced from observations made at Breslau, in Silesia. In 1724 M. de Moivre published the first edition of his tract on *Annuities on Lives*. In order to facilitate the calculation of their values, M. de Moivre assumed the annual decrements of life to be equal; that is, he supposed that out of 86 (the utmost limit of life on his hy-

pothesis) persons born together, one would die every year till the whole were extinct. This assumption agreed pretty well with the true values between 30 and 70 years of age, as given in Dr. Halley's table; but was very remote from the truth in the earlier and later periods. Mr. Thomas Simpson, in his work on *Annuities and Reversions*, originally published in 1742, gave a table of mortality deduced from the London bills, and tables founded upon it of the values of annuities. But at the period when this table was calculated, the mortality in London was so much higher than in the rest of the country, that the values of the annuities given in it were far too small for general use. In 1746 M. Deparcieux published, in his *Essai sur les Probabilités de la Durée de la Vie Humaine*—a work distinguished by its perspicuity and neatness—tables of mortality deduced from observations made on the mortuary registers of several religious houses, and on lists of the nominees in several tontines. In this work, separate tables were first constructed for males and females, and the greater longevity of the latter rendered apparent. M. Deparcieux's tables were a very great acquisition to the science, and are decidedly superior to some that are still extensively used. Dr. Price's famous work on *Annuities*, the first edition of which was published in 1770, contributed powerfully to direct the public attention to inquiries of this sort, and was, in this respect, of very great utility. Of the more recent works, the best are those of Mr. Baily and Mr. Milne, which, indeed, are both excellent. The latter, besides all that was previously known as to the history, theory, or practice of the science, contains much new and valuable matter; and to it we beg to refer such of our readers as wish to enter fully into the subject.

The table on which Dr. Price laid the greatest stress was calculated from the burial registers kept in the parish of All Saints, in Northampton, containing little more than half the population of the town. There can be no doubt, however, as well from original defects in the construction of the table, as from the improvement that has since taken place in the healthiness of the public, that the mortality represented in the Northampton table is, and has long been, decidedly above the average rate of mortality in England. Mr. Morgan, indeed, the late learned actuary of the Equitable Society, contended that this is not the case, and that the society's experience shows that the Northampton table is still remarkably accurate. But the facts Mr. Morgan disclosed in his "Views of the Rise and Progress of the Equitable Society," p. 42, published in 1828, are quite at variance with this opinion; for he there states, that the deaths of persons insured in the Equitable Society, from 50 to 60 years of age, during the 12 years previously to 1828, were 389; whereas, according to the Northampton table, they should have been 545! And Mr. Milne has endeavored to show (*Art. Annuities*, new ed. of *Ency. Brit.*) that the discrepancy is really much greater.

The only other table used to any extent in England for the calculation of life annuities, is that framed by Mr. Milne, from observations made by Dr. Heysham on the rate of mortality at Carlisle. It gives a decidedly lower rate of mortality than the Northampton Table; and there are good grounds for thinking that the mortality which it represents is not very different from the actual rate throughout most parts of England; though it can not be supposed that a table founded on so narrow a basis should give a perfectly fair view of the average mortality of the entire kingdom.

In life insurance, the first annual premium is always paid at the commencement of the assurance, and the others at the beginning of each year, so long as the party assured survives. Hence, at the beginning of the assurance, the whole of the annual premiums payable for it exceed the value of an equal annuity on life by one year's purchase. And, therefore, when the value of an assurance in present money is given,

to find the equivalent annual premium during the life, the whole present value must be divided by the number of years' purchase an annuity on the life is worth, increased by 1. Thus, for an assurance of \$100 on a life of 40 years of age, an office, calculating by the Carlisle table of mortality, and at 4 per cent. interest, requires \$58.446 in present money. Now, according to that table and rate of interest, an annuity on a life just 40 years of age is worth 15.074 years' purchase, so that the equivalent annual premium is $\frac{\$58.446}{15.074 \times 1} = \3.325 . The annual premium may, however, be derived directly from the value of an annuity on the life, without first calculating the total present value of the assurance. See Mr. Milnes *Treat. on Annuities*, or art. *Annuities*, in new edition of *Ency. Brit.*

"In order to exhibit the foundation upon which tables of life annuities and insurance have been founded in this and other countries, we have given, in a portion of the preceding tables, the rate of mortality that has been observed to take place among 1000 children born together, or the numbers alive at the end of each year, till the whole become extinct, in England, France, Sweden, etc., according to the most celebrated authorities. The rate of mortality at Carlisle, represented in this table, is less than that observed anywhere else: the rates which approach nearest to it are those deduced from the observations already referred to, of M. Deparcieux, and those of M. Kersseboom, on the nominees of life annuities in Holland. In order to calculate from this table the chances which a person of any given age has of attaining to any higher age, we have only to divide the number of persons alive at such higher age, given in the column of the table selected to decide the question, by the number of persons alive at the given age, and the fraction resulting is the chance. We have added, by way of supplement to this table, Mr. Finlayson's table (No. VI.) of the rate of mortality among 1000 children born together, according to the decrement of life observed to take place among the nominees in government tontines and life annuities in this country, distinguishing males from females. The rate of mortality which this table exhibits is decidedly less than that given in the Carlisle table; but the lives in the latter are the average of the population, while those in the former are all picked. The nominees in tontines are uniformly chosen among the healthiest individuals; and none but those who consider their lives as good ever buy an annuity. Still, however, the table is very curious; and it sets the superiority of female life in a very striking point of view. Tables VII. and VIII. give the *expectation of life*, according to the mortality observed at Northampton and Carlisle; the former by Dr. Price, and the latter by Mr. Milne. The next table, No. IX., extracted from the *Second Report of the Committee of the House of Commons on Friendly Societies*, gives a comparative view of the results of some of the most celebrated tables of mortality, in relation to the rate of mortality, the expectation of life, the value of an annuity, etc. The coincidence between the results deduced from M. Deparcieux's table and that for Carlisle, is very striking. And to render the information on these subjects laid before the reader as complete as the nature of this work will admit, we have given tables (Nos. X.-XV.) of the value of an annuity of £1 on a single life, at every age, and at 3, 4, 5, 6, 7 and 8 per cent., according to the Northampton and Carlisle tables; we have also given tables of the value of an annuity of £1 on 2 equal lives, and two lives differing by five years, at 3, 4, 5, and 6 per cent., according to the same tables. It is but seldom, therefore, that our readers will require to resort to any other work for the means of solving the questions that usually occur in practice with regard to annuities; and there are not many works in which they will find so good a collection of the tables." We subjoin one or two examples of the mode

of using the tables of life annuities. Suppose it were required, what ought a person aged 45, to give to secure an annuity of \$50 a year for life, interest at 4 per cent., according to the Carlisle table? In Table No. XI., under 4 per cent., and opposite 45, is 14.104, the value of an annuity of \$1, which being multiplied by 50 gives \$705.20, or the value required. According to the Northampton table, the annuity would only have been worth \$614.15. The value of an annuity on two lives of the same age, or on two lives different by five years, may be found in precisely the same way. Some questions in *reversionary* life annuities admit of an equally easy solution. Thus, suppose it is required to find the present value of A's interest in an estate worth \$100 a year, falling to him at the death of B, aged 40, interest 4 per cent., according to the Carlisle table? The value of the perpetuity of \$100 a year, interest 4 per cent., is \$2500; and the value of an annuity of \$100 on a person aged 40, interest 4 per cent., is \$1507.40, which, deducted from \$2500, leaves \$992.60, the present value required. A person aged 30 wishes to purchase an annuity of \$50 for his wife, aged 25, provided she survives him; what ought he to pay for it, interest at 4 per cent, according to the Carlisle table? The value of an annuity of \$1 on a life aged 30 is \$16.852; from which subtracting the value of an annuity of \$1 on two joint lives of 25 and 30, 14.339, the difference, $2.513 \times 50 = 125.650$, the sum required. For the solution of the more complex cases of survivorship, which do not often occur in practice, recourse may be had to the directions in Mr. Milne's *Treatise on Annuities*, and other works of that description. To attempt explaining them here would lead us into details quite inconsistent with the object of this work." See *Com. Dict.*, art. INTEREST, by J. R. McCULLOCH; *Bankers' Mag.*, N. Y., 1858-6; the Interest Tables now in use in New York city, are by Delisser, Six and Seven per Cent. 4to \$4; PRICE, 8vo; OATES, 8vo.

Invoice, an account of goods or merchandise sent by merchants to their correspondents at home or abroad, in which the peculiar marks of each package, with other particulars, are set forth.

The revenue laws of the United States require two consular certificates only to invoices of foreign merchandise imported into this country (the owners of which reside abroad)—one authenticating the invoice, the other as to the value in Spanish or American dollars of the currency in which the invoice is made out. Where consular certificates to invoices of goods destined for the United States are required, they are to be granted only by the consular officer within whose consular jurisdiction such goods have been manufactured or prepared for exportation. A practice, it is understood, has extensively prevailed of transmitting invoices to a consular officer at the port of shipment for the usual consular certificates, whose certificate must often necessarily be given without due knowledge of their accuracy or details. Thus, invoices of goods manufactured or prepared for shipment in Switzerland have sometimes heretofore been sworn to at Havre; invoices from Lyons have been verified at Marseilles; and those from the Prussian provinces of the Rhine, at the ports of Holland and Belgium. It is manifest that great abuses must spring from such a practice, the meaning and intent of the law being to require those who have an accurate knowledge of the contents of invoices, and the prices of goods comprising the same, personally to depose to their valuation. All consular officers of the United States are strictly enjoined to conform to this rule, and report to the Treasury Department any violation of it which may come within their knowledge. Under the provisions of the act of Congress of 1st March, 1823, the invoices of all imported goods subject to *ad valorem* duty belonging to persons not residing in the United States, must be sworn to and verified by consular certificates; the oath must be taken by the owner or manufacturer

of the goods, or a member of the firm owning or manufacturing them, and not by a clerk or other subordinate.

In all cases where the oaths to invoices are not taken before the United States' consul, but before some public officer duly authorized to administer oaths in the country where the goods shall have been purchased, the official certificate of such officer must be authenticated by a consular officer of the United States. If there be no consular officer of the United States in the country from which the merchandise shall have been imported, the authentication must be executed by a consul of a nation at the time in amity with the United States, if there be any such residing there. If there be no such consul, the authentication must be made by two respectable merchants, if any such there be, residing at the port from which the merchandise shall have been imported.

It is proper that the oath taken by foreigners should be administered to them, not only in their own language, so that they may fully understand the nature and import of it, but also in the form practiced in their own country, which would probably be considered by them as more solemn and of a more binding nature than if administered in a form to which they have not been accustomed. The attention of consular officers is also directed to the 8th and 11th sections of the act of Congress of the 1st March, 1823, in which it will be seen that a consular certificate is required in all cases of invoices of goods exported by the *manufacturers* thereof, in whole or in part for their account, notwithstanding another owner in part may reside in the United States. This provision of the law of 1823, there is reason to believe, has been hitherto overlooked in many instances. If a consular officer ascertains and has reliable evidence of the falsity of an oath, administered either by himself or by a local magistrate whose certificate he has authenticated, he should notify the Treasury Department, which will transmit to him the original invoice and oath, to be used, if deemed expedient, in a prosecution for perjury.

It is to be remarked that, by the act of 3d March, 1801, invoices of all goods imported into the United States *subjected to a duty ad valorem* are required to be "made out in the currency of the place or country from whence the importation shall be made; and shall contain a true statement of the actual cost of such goods in such foreign currency or currencies, without any respect to the value of the coins of the United States, or foreign coins which now are, or shall be, by law, made current within the United States in such foreign place or country." Hence, invoices of free goods are not required to be made out in the currency of the country from whence the goods may be imported; but whenever invoices of such goods may be made out in the currency of the country, and said currency is depreciated, and its value not fixed by any law of the United States, a consular certificate of the value of such currency must, as before intimated, accompany the same.

There is nothing in the law or instructions of the Treasury Department to prohibit invoices of free goods from being made out in the currency of the United States, or that of any other country where its value is fixed by our laws. Invoices of *ad valorem* or free goods, when made out in a foreign depreciated currency, or a currency the value of which is not fixed by the laws of the United States, whether the importer or owner resides in this country or abroad, must in each case be accompanied by a consular certificate, showing the value of such currency in Spanish or United States silver dollars. Applications are frequently made to the Treasury Department for permission to enter merchandise where the invoices are not accompanied by the needful consular certificates in the cases where such certificates are by law required. That Department has heretofore acted with great leniency and indulgence in such cases, but experience has

shown the necessity for a more rigid course in future; and, in all cases where such consular certificates should accompany the invoices, any penalty which may be incurred for want of them will be regularly enforced.

Consuls abroad, by due attention and vigilance, can do much toward checking and preventing the numerous frauds which are undoubtedly practiced upon the revenue, if they will report to the collectors of the customs of the United States all those invoices where, in their opinions, undervaluations have been made, and by otherwise keeping the collectors or this Department generally and fully advised on this subject; and they are earnestly requested to do so, and to consider it one of the most important services which they can render in connection with the faithful collection of the revenue. An erroneous impression exists with many foreign shippers of goods to the United States, that the consuls before whom the oath to invoices is either taken or verified have no power to examine the details of such invoices, but simply to verify the fact of such oath being taken before them, or by an officer in authority known to them as such. This is not the fact; and consular officers are expected before verifying invoices to satisfy themselves of their correctness.

For the purpose of carrying out a particular system of revenue duties, the government of the United States requires that the accuracy of certain invoices should be ascertained and verified; and a reasonable time for consuls to accomplish that object, by an examination of such invoices, can not be justly denied to them. Consular officers are not supposed to be practically acquainted with the market prices or value of all merchandise within their district, or of the precise weights, tares, measures, bounties, etc., included therein; but inquiry and experience will soon enable them to render efficient aid to the revenue officers of the United States, by ascertaining errors or frauds, and promptly informing the Treasury Department, as well as the collector of the port to which the goods may be destined, of every instance where an exporter persists in refusing to correct his invoice, when apprised of its defects, and that it will be subject to revision at the custom houses of the United States.

CERTIFICATE TO INVOICE.

Foreign Owner's oath, where goods, wares, or merchandise, have been actually purchased.

I, _____, do solemnly and truly swear, that the goods, wares, or merchandise described in the invoice now produced, and hereunto annexed, were actually purchased for my account, or for account of myself and partners in the said purchase: and that said invoice contains a true and faithful account of the actual cost thereof, and of all charges thereon; and that no discounts, bounties, or drawbacks, are contained in the said invoice but such as have been actually allowed on the same.

Sworn to and subscribed before me, at _____, the _____ day of _____, A.D. 18____, and of the independence of the United States the _____: and I do further certify, that I am satisfied that _____, who subscribes the foregoing oath, is the person he represents himself to be; that he is a credible person; and that the statements made by him under said oath (or affirmation, as the case may be) are true.

[L. S.]

U. S. Consul.

CERTIFICATE TO INVOICE.

Foreign manufacturer or owner's oath, in cases where goods, wares, or merchandise, have not been actually purchased.

I, _____, of _____, do solemnly and truly swear, that the invoice now produced, and hereunto annexed, contains a true and faithful account of the goods, wares, or merchandise therein described at their market value at _____, at the time the same were (procured or manufactured, as the case may be), and of all charges thereon; and that the said invoice contains no discounts, bounties, or drawbacks, but such as have been actually allowed.

Sworn and subscribed before me, at _____, the _____ day of _____, A.D. 18____, and of the independence of the United States of America the _____: and I further certify, that I am satisfied that _____, who subscribes the foregoing

oath, is the person he represents himself to be; that he is a credible person: and that the statements made by him under said oath (or affirmation, as the case may be) are true.

[L. s.]

U. S. Consul.

Consular Certificate of the value of currency.

I, _____, consul of the United States of America, do hereby certify, that the true value of the currency of the _____ of _____, in which currency the annexed invoice of merchandise is made out, is _____ cents, estimated in American or Spanish silver dollars.

Ionian Islands, the name given to the islands of Corfu, Paxo, Santa Maura, Ithaca, Cephalonia, Zante, Cerigo, and their dependent islets. With the exception of Cerigo, which lies opposite to the south-eastern extremity of the Morea, the rest lie pretty contiguous, along the western coasts of Epirus and Greece; the most northerly point of Corfu being in lat. $39^{\circ} 48' 15''$ N., and the most southerly point of Zante (Cape Kieri, on which there is a light-house) being in lat. $37^{\circ} 38' 35''$ N. Kapsali, the port of Cerigo, is in lat. $36^{\circ} 7' 30''$ N., long. 23° E. The area and population of the different islands may be estimated as follows:

Islands.	Area in sq. miles 15 to a degree.	Population in 1852.
Corfu.....	10.76	79,581
Cephalonia.....	16.20	70,870
Zante.....	5.60	41,992
Santa Maura.....	4.25	18,966
Ithaca and Calamos.....	8.32	11,264
Cerigo and Cerigotto.....	4.50	12,886
Paxo and Antipaxo.....	1.90	5,111
Total.....	47.12*	240,620

* This is equal to 1001.8 English square miles of 60.15 to the degree.

Soil and Climate.—These are very various. Zante is the most fruitful. It consists principally of an extensive plain, occupied by plantations of currants, and having an air of luxuriant fertility and richness. Its climate is comparatively equal and fine, but it is very subject to earthquakes. Corfu and Cephalonia are more rugged and less fruitful than Zante; and the former, from its vicinity to the snowy mountains of Epirus, and the latter from the Black Mountain (the Mount Enos of antiquity) in its interior, are exposed in winter to great and sudden variations of temperature; the frost sometimes damaging to a great extent the oranges and vines of these islands and those of Santa Maura. The latter is, in the hot season, exceedingly unhealthy—a consequence of the vapors arising from the marshes and the shallow seas to the north-east. Cerigo is rocky and sterile; it is subject to continued gales, and the current seldom permit its waters to remain unruffled.

These islands have undergone many vicissitudes. Corfu, the ancient Corcyra, was famous in antiquity for its naval power, and for the contest between it and its mother state Corinth, which eventually terminated in the Peloponnesian war. Ithaca, the kingdom of Ulysses; Cephalonia, sometimes called Dulichium, from the name of one of its cities; Zante, or Zacynthus; Santa Maura, known to the ancients by the name of Leucas or Leucadia, celebrated for its promontory, surmounted by a temple of Apollo, whence Sappho precipitated herself into the ocean; and Cerigo, or Cythera, the birth-place of Helen, and sacred to Venus;—have all acquired an immortality of renown.

For upward of 400 years these islands remained subject to Venice, constituting the Venetian Levant. By the treaty of Paris, 5th November, 1815, between England and Russia, it was agreed that the Ionian Islands should regulate their own internal organization, with the approbation of the protecting power, which should be represented by a lord high commissioner; that the merchant flag of the new States should be acknowledged as that of a free and independent State; and that Austria should enjoy equal

commercial privileges with Great Britain in its commerce with the republic. This treaty was acceded to by all the representatives of the allied powers, then negotiating at Paris, and by the Grand Sultan and the King of the Two Sicilies. The ports of the islands are Corfu, Cephaloni, Zante, Santa Maura, Ithaca, Cerigo, and Paxo. These are free ports, at which all kinds of merchandise may be stored in designated warehouses, free of any duties or charges, except rent, portage, and other minor expenses, which are regulated by special tariffs. There is no treaty between the United States and the Ionian republic, and the commercial intercourse between the two countries is subject to the various restrictions which apply to non-equalized vessels. The restrictions are higher tonnage duties, light duties, port charges, etc.

The following items will illustrate these discriminations: Charges for clearance, including bill of health, muster-roll, anchorage, and light duties, on an Ionian or equalized vessel of from 250 to 300 tons; \$8 10; charges, etc., including as above, for a non-equalized vessel of from 250 to 300 tons, \$10 84.

Other restrictions and discriminations exist in favor of equalized flags, especially in the transhipment of merchandise from one port to another, which confer such advantages on vessels coming under this category, as to preclude all competition on the part of those belonging to the other class. Merchandise transhipped, as above, in the former, is exempt from every extra charge; in the latter, three fourths of the original duty is exacted on all merchandise paying specific duties, and five per cent. on such as pay ad valorem duties. These discriminating duties amount, in the aggregate, to about 14 per cent. against non-privileged vessels. There entered, in the year 1851, into all the Ionian ports, 1435 vessels, measuring 169,144 tons; and there cleared 1401 vessels, measuring 164,780 tons; making, in all, 2836 vessels, measuring 333,924 tons.

The flags of these vessels represented 14 different nations, among which the United States is not included. Indeed, it is but seldom that a United States' vessel is found in any of the Ionian ports, nor can we look for any direct trade between the two countries so long as the present restrictions exist. Their removal can be effected by treaty or convention only; and negotiations to this end, under the constitution of the Ionian republic, must originate at London, as all diplomatic questions and conventions between these islands and foreign States must be conducted by the government of the protecting power.

Manufactures, etc.—These islands possess few manufactures properly so termed. The wives of the villani, or peasants, spin and weave a coarse kind of woolen cloth, sufficient in great part for the use of their families. A little soap is made at Corfu and Zante. The latter manufactures a considerable quantity of silk gros-de-Naples and handkerchiefs; the art of dyeing is, however, too little studied, and the establishments are on too small a scale. The peasantry, in general, are lazy, vain, delighting in display, and very superstitious. Those of Zante and Cephalonia are more industrious than the Corfiotes; in the first, particularly, their superior condition is probably to be ascribed, in part at least, to the nobles residing more on their estates in the country, and contributing, by their example, to stimulate industry. In Corfu, the taste for the city life, which prevailed in the time of the Venetian government, still operates to a great degree. The Corfiote proprietor resides but little in his villa; his land is neglected, while he continues in the practice of his forefathers, who preferred watching opportunities at the seat of a corrupt government, to improving their fortunes by the more legitimate means of honorable exertion and attention to their patrimony. In this respect, however, a material change for the better has taken place during the last 20 years.

Imports of Grain, etc.—Great part of the land is

held under short tenures, on the *metayer* system, the tenant paying half the produce to the landlord. Owing to the nature of the soil, and the superior attention given to the culture of olives and currants, the staple products of the islands, most part of the grain and cattle required for their consumption is imported. The hard wheat of Odessa is preferred, and large sums are annually sent to the Black Sea in payment. The Parliament, in March, 1833, repealed the duties on the introduction of corn; and the grain monopoly of Corfu, which had been established in favor of government, in order to provide against the possibility of a general or partial scarcity, was then also suffered to expire. These two sources of revenue, while they existed, did not probably produce less than £20,000 annually. They are similarly dependent upon Greece and Turkey for supplies of butcher's meat; a small number only of sheep and goats being bred in the islands. Oxen, whether for agriculture or the slaughter-house, are principally brought from Turkey. The beeves eaten by the troops are six weeks or two months walking down from the Danube, and the provinces that skirt it, to the shores of Epirus, where they remain in pasture until fit for the table.

Exports.—The staple exports from these islands are oil, currants, wine, soap, salt, and Valonia. The first is produced in great abundance in Corfu and Paxo, and in a less quantity in Zante, Santa Maura, and Cephalonia. Corfu has, in fact, the appearance of a continuous olive wood; a consequence, partly, of the extraordinary encouragement formerly given to the culture of the plant by the Venetians. Although there is a harvest every year, the great crop is properly biennial; the tree generally reposing for a year after its effort. (In France and Piedmont the period of inactivity is two and three years.) During five or six months, from October till April, the country, particularly in Corfu, presents an animated appearance, persons of all ages being busily employed in picking up the fruit. The average price may be about £1 11s. per barrel. Under the old Venetian system, the oil could only be carried to Trieste. It is charged with an *ad valorem* duty of 18 per cent., payable on the export. The quality might be much improved by a little more care in the manufacture, the trees being generally finer than in any other country. Currants, originally introduced from the Morea, are grown in Zante, Cephalonia, and Ithaca, but principally in the first. The plant is a vine of small size and delicate nature, the cultivation of which requires much care. Six or seven years elapse after a plantation has been made before it yields a crop. In the beginning of October, the earth about the roots of the plants is loosened, and gathered up in small heaps, away from the vine, which is pruned in March; after which the ground is again laid down smooth around; the blight called the "brina," and rainy weather in harvest produce great mischief. The currants are gathered toward September, and after being carefully picked, are thrown singly upon a stone floor, exposed to the sun in the open air. The drying process may occupy a fortnight or longer, if the weather be not favorable. A heavy shower or thunder-storm (no unfrequent occurrence at that season), not only interrupts it, but sometimes causes fermentation. The fruit is then only fit to be given to animals. Should it escape these risks, it is deposited in magazines called "*scraglie*," until a purchaser casts up.

The exports of these islands are raisins, olives, olive-oil, honey, soap, silk, and wine; and the imports are coffee, sugar, wines, brandy, grain, cured fish, manufactures of wood, wool, cotton, iron, etc. Currants and raisins constitute the heaviest articles of export from these islands, the annual produce of currants amounting to some 12,000,000 pounds; but of late years the producers have had to contend with diseases called "the blight," for which sulphur has proved to be the

only efficient remedy. Notwithstanding the partial failure of the crops from this cause, for four consecutive years, the exports of currants in 1855 show an active and remunerating trade. The following summary for this year will give some idea of the extent of the currant trade of the republic:

	Exported to		Distilled.		Existing in stores.	Total.
	England.	Trieste.	Pounds.	Pounds.		
Zante.....	701,931	85,867	1,002,702	1,790,000
Cephalonia.....	4,868,400	435,486	576,118	120,000	5,999,999
Ithaca.....	46,000	4,000	50,000
Santa Maura.....	10,000
Total.....	5,570,331	566,553	1,582,815	120,000	7,849,999

Salt may be obtained in considerable quantities in Corfu, Zante, and Santa Maura, for exportation; the latter island alone produced it until the late act of Parliament, which provided that government should let the salt-pans in all the islands to those bidders who should offer, by sealed tenders, to supply it at the lowest rate to the consumer, paying at the same time the highest price to government. No export duty is charged upon it. These statements show that heavy duties are levied upon the exportation of the staple products of the islands—an objectionable system, and one which, if it is to be excused at all, can only be so by the peculiar circumstances under which they are placed. There is no land-tax or impost on property in the Ionian Islands, such as exists in many other rude countries; and, supposing it were desirable to introduce such a tax, the complicated state of property in them, the feudal tenures under which it is held, and the variety of usages with respect to it, oppose all but invincible obstacles to its imposition on fair and equal principles. At the same time, too, a large amount of revenue is required to meet the expenses of the general and local governments, to maintain an efficient police, and to prevent smuggling and piracy. However, we can not help thinking that some very material retrenchments might be made from the expenditure; and it is to this source, more, perhaps, than to any other, that the inhabitants must look for any real or effectual relief from their burdens.

The Duties on Exports from the Ionian Islands are regulated by acts dated 8th June, 1835, 25th April, 1837, and 29th May, 1847. Oil and currants pay 18 per cent. *ad valorem*. Wine (excepting that of the Cephalonia Wine Company), 6 per cent. *ad valorem*. Soap, 8 per cent. *ad valorem*. Valonia, 6 per cent. *ad valorem*. All other articles free. N. B.—Oil shipped in vessels under Ionian colors for the purpose of being conveyed from one island to another of the States must pay only 7 per cent. *ad valorem*.

ACCOUNT OF THE REVENUE OF THE IONIAN ISLANDS IN 1851 AND 1852, SPECIFYING THE DIFFERENT ITEMS, AND THE AMOUNT OF EACH.

Value of merchandise in transit

Ports.—The principal ports in the Ionian republic are Corfu and Zante, in the islands of the same names, and Argostoli in Cephalonia. The city and port of Corfu lie on the east side of the island, on the canal

or channel between it and the opposite continent, which is here about five miles wide. The citadel, which projects into the sea, is furnished with a light-house, 240 feet high; the latter being in lat. $39^{\circ} 37' N.$, long. $19^{\circ} 56' E.$ The town is but indifferently built. Population about 18,000, exclusive of the military. The fortifications are very strong, both toward the sea and the land. The canal has deep water throughout; its navigation, which is a little difficult, has been much facilitated by the erection of a light-house on the rock of Tignoso in the northern entrance, where the channel is less than a mile in width; and by the mooring of a floating light off Point Leschino, in the southern entrance. Ships anchor between the small but well-fortified island of Vido and the city, in from 12 to 17 fathoms water. The port, or rather gulf, of Argostoli in Cephalonia, lies on the south-west side of the island. Cape Aji, forming its south-western extremity, is in lat. $38^{\circ} 8' 40'' N.$, long. $20^{\circ} 23' 30'' E.$ Cape San Nicolo, forming the other extremity, is about $\frac{1}{2}$ miles from Cape Aji, and between them, within about $\frac{1}{2}$ mile of the latter, is the small islet of Guardiani, on which is a light-house. From this islet the gulf stretches N. $\frac{1}{2}$ W., from seven to eight miles inland. The town of Argostoli lies on the west side of a haven on the east side of the gulf formed by Point Statura. The situation is low and rather unhealthy. Population about 5000. Its appearance and police, particularly the latter, have been much improved since its occupation by the English. There is deep water and good anchorage ground in most parts of the gulf. The best entrance is between Cape San Nicolo and Guardiani, keeping rather more than a mile to the eastward of the latter, on account of a reef that extends N. E. and S. W. from it nearly that distance.

The port and city of Zante are situated on the eastern side of the island, in lat. $37^{\circ} 27' N.$, long. $20^{\circ} 54' 42'' E.$ The city, the largest in the Ionian Islands, extends along the shore for nearly $\frac{1}{2}$ mile, but it is nowhere above 200 yards in breadth, except where it ascends the hill on which the citadel is erected. The style of building is chiefly Italian; and the interior of the city displays every where great neatness, and even a certain degree of magnificence. Population estimated by Dr. Burgess at about 20,000. It has a mole or jetty of considerable utility, at the extremity of which a light-house is erected; and a lazaretto, situated a little to the south-west. The harbor is capacious. Ships anchor opposite the town at from 500 to 1000 yards' distance, in from 12 to 15 fathoms, availing themselves of the protection of the mole when the wind is from the north-east. When the troops took possession of Zante, in 1810, the fortifications were found to be in very bad repair; but immense sums have since been expended upon their improvement and extension.

In 1853 566,817 tons of shipping entered the ports of the Ionian Islands, of which 27,316 were English. The others were Ionian, Greek, Turkish, etc.

Money.—Accounts are kept in sterling money, or in Spanish dollars and oboli, 100 oboli being = 1 doll. = 4s. 4d.; a doubloon = 1 dollar.—TATE'S *Cambist*.

Weights.—English weights and measures are sometimes made use of, though with Italian denominations; but the following are most generally used: The pound *peso grosso*, or great weight of 12 oz. = 7384 grains Troy; 94.8 lbs. = 100 lbs. avoirdupois. The pound *peso sottile*, or small weight used for precious metals and drugs, is 1-3d lighter than the foregoing; 12 oz. *peso sottile* corresponding to 8 oz. *peso grosso*.

The oke, used in the southern islands, weighs about 18,900 grains Troy, or 27.10 lbs. avoirdupois. The Levant cantar, or quintal, should contain 44 okes. The miglajao (1000 lbs.), for currants in Zante, is 1 per cent. lighter than other articles.

Measures of Length.—The Venetian foot is 12 oncé = $13\frac{1}{2}$ inches English. Passo = 5 Venetian feet. Braccio, for cloths, etc., = 27.8-16 inches English.

Do. for silks, = 25 3-18. Land is measured by the *misura* or 1-8 of a *moggio*, or *bacile*, 400 square *passi* being 1 *misura*, or *bacile*, about 3-10 of an acre English. Vineyards are measured by the *zappade*; 3 *zappade* (a computed day's work) being 1 *misura*. Firewood is measured by the square *passo*, usually, however, only 2 feet thick, this depending on the quality of the wood. Stone is measured by the *passo cubo*.

Measures of Capacity.—*Corn.*—Corfu and Paxo: *moggio* of 8 *misura*, about 5 Winchester bushels. Cephalonia: *bacile* should contain 80 lbs. *peso grosso*, best quality wheat. Santa Maura: *cado* of 8 *scrivelli*, 4 = 3 *mog.*; 1 *cado* = 3½ bushels English. Ithaca: 5 *bacile* = 1 *moggio*. Cerigo: *chiló*, the measure of Constantinople, = 1 bushel English.

Wine.—Corfu and Paxo: 32 *quartucci* = 1 jar, and 4 jars = 1 barrel = 18 English wine gallons. Cephalonia and Ithaca: 2 *quartucci* = 1 *boccale*; 4 *boccali* = 1 *secchio*; 6 *secchio* = 1 barrel = 18 English gallons. Zante: 13 1-3 *quartucci* = 1 *lire*; 40 *quartucci* = 1 jar; 3 jars = 1 barrel = 17 5-8 English wine gallons. Santa Maura: 22 *quartucci* = 1 *stamno*; 6 *stamni* = 1 barrel = 18 English wine gallons. Cerigo: 2 *agoston* = 1 *boccia*; 30 *boccio* = 1 barrel = 18 English wine gallons.

Oil.—Corfu and Paxo: 4 *quartucci* = 1 *miltro*; 6 *miltro* = 1 jar; 4 jars = 1 barrel = 18 English wine gallons. Cephalonia: 9 *pagliazzi* = 1 barrel = 18 English wine gallons. Zante: 9 *lire*, or 3 jars of 46 *quartucci* each = 1 barrel 5-8 English wine gallons. Santa Maura: 7 *stamni* = 1 barrel = 18 English wine gallons. Ithaca: 13 *pagliazzi* = 1 barrel = 18 English wine gallons. Cerigo: 24 *bozze* = 1 barrel = 14 0-5 English wine gallons. *Salt.*—Centinajo, about 4000 lbs. Venetian *peso grosso*. *Lime.*—Corfu, measure of 4 English cubic feet.

In compiling this article, we have consulted, besides the works referred to above, the *Voyage Historique Pittoresque*, etc., by SAINT SAUVEUR—a diffuse but valuable work. The account of Zante, in the last volume (tome iii., pp. 101-278), is particularly good. We have also looked into the *Voyage en Grèce* of SCROFANI, 3 tomes, Paris, 1801; the *Archives du Commerce*; the *Papers laid before the British Finance Committee*, etc. See *Westm. Rev.*, xxxviii., 413; *Monthly Rev.*, lxxxiii., 225, cii., 138; *Quar. Rev.*, xxix., 86; *Chris. Rev.*, xiv., 625; *Com. Rel. U. S.*, vol. i., 457, vol. ii., 171.

Iowa, one of the United States of North America, lies between north lat. 40° 40' and 43° 30', and west long. 90° 12' and 96° 53'. It is bounded north by Minnesota Territory, east by the Mississippi River, which separates it from the States of Illinois and Wisconsin, south by Missouri, and west by the Missouri and the great Sioux Rivers, the former of which separates it from the Indian Territory, and the latter from Minnesota. Greatest length from east to west, 307 miles; greatest breadth, 196 miles; area, 50,914 square miles.

The surface of Iowa is somewhat elevated and generally undulating. It has no mountains, nor even hills, of any great height. Table Mound, a conical elevation with a flat summit, three or four miles from Dubuque, is perhaps 500 feet high. On the borders of the rivers there are frequent "bluffs" which are generally from 40 to 130 feet high. The highest ground in the State is a plateau in the north-west, called *Coteau des Prairies*, which enters it from Minnesota. The southern part of the State abounds with grassy lawns and verdant plains, intersected by numerous rivers, the chief of which are the Des Moines, the Skunk, the Iowa, and the Red Cedar (a branch of Iowa) Rivers which flow in a south-east direction into the Mississippi. The banks of almost all of these rivers are skirted with belts of wood. The distinguishing feature, however, of Iowa is its unique and admirably diversified prairies, sometimes spreading out into

vast plains. The entire State is named "a rolling prairie" by the settlers, from the resemblance its surface bears to the rolling swell of the ocean. From the absence of wood, the scenery becomes wearisome and tame.

The soil of Iowa is in general fertile. Near the confines of the Coteau des Prairies the country is hilly and desolate; the high lands being covered with gravel support but a scanty vegetation, while the low grounds are marshy. It appears, however, from the surveys which have been made, that no State in the Union has a smaller proportion of inferior land. Dr. Owen, in his geological report, remarks that "the soil of Iowa is generally excellent, and of easy cultivation. The valleys—especially of the Red Cedar, Iowa, and Des Moines Rivers—present a body of arable land, which, taken as a whole, for richness in organic elements, for amount of saline matter, and due admixture of earthy silicates, affords a combination which belongs only to the most fertile upland plains." The climate is generally more healthful than most of the new States. The openness of the country renders it less liable than is usual to the influence of malaria; the air on the upland prairies is buoyant, and rendered free from all pernicious influences by the refreshing breezes that blow periodically over them. The rapid flow of its rivers also carries off in the valleys those miasmatic influences which otherwise tend to the production of disease. The winter is occasionally severe, but the severity is not so great as is usual in the same latitudes. The summer, also, is less oppressively hot.

Iowa is strictly an agricultural country. Its fine prairies and rich natural pastures afford peculiar facilities for rearing cattle and sheep. Wool-growing has accordingly become one of the staple employments of the settlers. The raising of hogs is an occupation equally common and profitable. The value of live stock in 1850 was estimated at \$3,660,000, and slaughtered animals at \$810,000. The amount of wool produced was 373,898 pounds. Considerable progress has recently been made in agriculture, as shown by the increase of various productions of the State. For instance, in 1840 there were only 154,693 bushels of wheat grown; in 1850, there were 1,540,581; in 1840, 216,385 bushels oats; in 1850, 1,524,345; in 1840, 1,406,241 bushels maize; in 1850, 8,656,799. All the other productions common to similar latitudes are grown in Iowa, and have increased in an equal or greater proportion.

Manufactures have, until recently made little progress in the State. Having only existed for little more than 10 years as an independent State, time has not been afforded to develop its manufacturing resources. Possessing within itself abundance of the two grand elements for manufacturers—coal and water power—there can be no doubt that Iowa will yet be distinguished as a manufacturing State. In 1850 the number of manufacturing establishments, producing each to the value of \$500 annually and upward, was 482. Of these there were three for the manufacture of cast iron, 14 tanneries, and one woolen factory. The others are chiefly employed in the manufacture of articles for ordinary and domestic purposes and agricultural implements. The home-made manufactures in the year ending 1st June 1850, were valued at \$220,000.

The minerals of Iowa are not of great variety. The vast bituminous coal-field of the State occupies most of its central and southern portions. For upwards of 200 miles the River Des Moines passes through this great deposit, the area of which has been estimated at about 20,000 square miles embracing a country equal in extent to more than one half of the State of Indiana. The beds of coal, which are 100 feet in thickness, lie near the surface, and may be worked at small expense. The lead mines of Iowa are a continuation of those of Illinois and Wisconsin. The workings are

old and have been very productive. They occur in the north-east part of the State, Dubuque, one of the oldest settlements in North America, being the chief town of the lead-mining district. Dr. Owen, in his *Geological Survey*, remarks that the lead-mines of Iowa produce as much of that metal as the whole of Europe, except Great Britain, and that their capabilities are unbounded. Zinc is found chiefly in the form of electric calamine, in cellular masses in connection with the lead. This mineral occurs in some "diggings" also, in a state of carbonate, and in others, as a sulphuret. Copper is found in the same localities as zinc. It has recently been discovered in Cedar county in considerable quantities. Iron-ore is abundantly distributed, but as yet, only a small quantity of it has been converted into metal. In the geological survey of the State above referred to, it is affirmed that its resources and capabilities are such that 10,000 laborers and miners might be profitably employed within its boundaries. Iowa has no direct foreign commerce, but its trade with the ports of the Atlantic and the Mexican Gulf is very considerable, and rapidly increasing. The exports consist of agricultural and mining products. The home traffic of this State is also very considerable. The facilities which it possesses, both for internal trade and foreign commerce are very abundant, and in a short time will be greatly increased. A railroad of 180 miles in length has been projected between Dubuque, the capital of the lead-mining district, and Keokuk, the chief port of the State for foreign trade. Keokuk, Davenport, Lyons, and Dubuque will also shortly be connected by railroads with the interior. Besides these, which will radiate through the State in various directions, the grand trunk line is proposed to be carried from this city westward to Council Bluffs on the Missouri, and will form a part of the great Pacific line which is to terminate at San Francisco, in California. Through Iowa will also pass a branch of the great chain of north and south railroads connecting St. Louis with the extreme settlements of Minnesota Territory. When these are completed, both the home and foreign commerce of the State will be indefinitely increased. Congress has given 1,300,000 acres for the improvement of the Des Moines River, as far as Des Moines City—to be made navigable for large steamboats. In July, 1856, there were 108 miles of railroad finished, and 1110 proposed, for which Congress, in May, 1856, appropriated 4,320,000 acres. The valley of the Des Moines River contains at present half the population, as well as half the agricultural wealth of the State, and its prosperity may for some time depend as much upon the improvement of navigation on this river, as upon the execution of these projected railroads. The Des Moines rises in the Coteau des Prairies, in the south-west of Minnesota, and flowing through the State in general in a south south-east direction, divides it into two nearly equal sections, and after a course of 400 miles, falls into the Mississippi at the south-east extremity of the State, about four miles below Keokuk. Iowa has many other interior rivers which are navigable for various—some of them for considerable—distances. The Skunk is more than 200 miles in length, and flows through a fertile country. It pursues a course of 150 miles in a south-east direction nearly parallel to Des Moines. The Iowa, from which the State takes its name, has, in general, a south south-east direction, and after a course of upwards of 300 miles, discharges itself in the Mississippi by two mouths, forming a delta, the sides of which are about six miles long. It is navigable by steamboats at all seasons, to Iowa City, 80 miles from its mouth, and for boats of light draught much further up. The Red Cedar (a branch of the Iowa), is navigable for 60 miles. The Wapsipinicon, the Makoquete, Turkey, and Upper Iowa Rivers have courses varying in length from 100 to 200 miles, and are navigable for distances of 20 to 60 miles. They

flow in an east or south-east direction into the Mississippi. The Great Sioux, an important tributary of the Missouri, forms the north-west boundary of the State; its length is estimated at 800 miles. The tributaries of the Missouri in this State are of minor importance. The Mississippi borders the State for its whole length on the east, and is navigable in time of high water for steamboats, to the mouth of the St. Peters, in Minnesota.

Ipecacuanha (Fr. *Ipecacuanha*; Ger. *Americianische brechwurzel*; It. *Ipecocanna*; Port. *Cipo de camaras*, *Ipecacuanha*; Sp. *Ipecacuana*, *Raiz de oro*), the root of a perennial plant (*Cephaelis ipecacuanha*), growing in Brazil and other parts of South America. It is from its color usually denominated *white*, *gray*, or *ash-colored*, and *brown*. Little of the first variety is found in the shops. The gray and brown varieties are brought to this country in bales from Rio Janeiro. Both are in short, wrinkled, variously bent, and contorted pieces, which break with a resinous fracture. The gray is about the thickness of a small quill, full of knots and deep circular fissures, that nearly reach down to a white, woody, vascular cord that runs through the heart of each piece; the external part is compact, brittle, and looks smooth; the brown is smaller, more wrinkled, of a blackish-brown color on the outside, and whitish within: the white is woody, and has no wrinkles. The entire root is inodorous; but the powder has a faint disagreeable odor. The taste is bitter, sub-acrid, and extremely nauseous. In choosing ipecacuanha, the larger roots, which are compact and break with a resinous fracture, having a whitish gray, somewhat semi-transparent appearance in the outside cortical part, with a pale straw-colored medullary fibre, are to be preferred. When pounded, ipecacuanha forms the mildest and safest emetic in the whole materia medica. Though probably employed in America from time immemorial, it was not introduced into Europe till the time of Louis XIV., when one Grenier, a French merchant, brought 150 pounds of it from Spain, with which trials were made at the Hôtel Dieu. Helvetius first made known its use in dysentery, for which Louis XIV. munificently rewarded him by a *douceur* of 25,000 francs.—*Thomson's Dispensatory*; *Thomson's Chemistry*.

Ireland, one of the largest of the European islands, is situated to the west of Great Britain, from which it is separated by a narrow channel called the Irish Sea and St. George's Channel on the east, and is bounded on its other sides by the Atlantic Ocean, through which it can maintain a direct communication with the continents of Europe, Africa, and America. The advantageous position, the fertility of the soil, and the salubrity of the climate, have conferred upon Ireland commercial facilities which are capable of being greatly increased. How far these natural advantages have been made available toward the internal improvement of the island itself, and the general benefit of the empire of which it forms an important part, may be best ascertained from the following details of its history and statistics.

Ireland is rhomboidal in shape, and placed at the eastern extremity of the Atlantic Ocean, which washes its northern, western, and southern shores, while its eastern coast is separated from the adjacent island of Great Britain by the Northern Channel, which at one point is only 13½ miles wide, the Irish Sea, about 130 miles in width, and St. George's Channel, which is 69 miles wide between Dublin and Holyhead, and somewhat less at its southern extremity. Its geographical position is between N. lat. 51° 26' and 55° 21', and W. long. 5° 20' and 10° 26', comprising, therefore, 3° 55' of lat., and 5° 6' of long.—the degrees of latitude being the same as those under which are situated the dissimilar climates of Berlin, Hamburg, Rotterdam, Leipzig, Warsaw, part of Hudson's Bay, the Straits of Belleisle, and Petropaulowski, in Kams-

chatka, which latter is nearly under the same parallel of latitude as Wicklow. The largest diagonal line that can be drawn within the island, viz., from Tor Head, in Antrim, to Mizen Head, in Cork, measures 302 miles; and the shorter, from Carnsore, in Wexford, to Erris Head, in Mayo, is 210 miles in length. The breadth of the country, from Dundalk to Ballyshannon is 85 miles; from Dublin to the head of Gal-

way Bay, 110 miles; and the indentations of the coast by harbors, arms of the sea, and mouths of rivers are so numerous, that scarcely an acre of land in the country is more than 50 miles from the sea or good navigation. The territorial divisions, and the acreable extent of Ireland, which, next to Great Britain, is the largest island in Europe, appear in the following table:

Territorial Divisions.			ACREABLE EXTENT, According to the Ordnance Survey and Census Report.					Annual amount of Griffith's Valuation.
Provinces.	No. of Baronies.	No. of Parishes.	Of arable land.	Of uncultivated land.	Of plantations.	Of towns and villages.	Of water.	
Leinster.....	124	1,008	3,961,198	781,886	115,944	15,569	51,624	4,876,211
Munster.....	75	824	3,874,613	1,893,477	180,415	14,693	151,881	6,064,579
Ulster.....	70	891	3,407,539	1,764,370	79,788	8,790	214,956	5,475,498
Connaught.....	47	392	2,220,960	1,906,002	48,940	3,877	212,864	4,892,048
Total.....	316	2,592	13,464,300	6,295,785	374,492	42,929	680,325	20,508,261
								11,439,575

Several coal-fields exist in Ireland, resting on a limestone basis. In Ulster, the district of Coal Island, in the county of Tyrone, produces coal of good quality, extensively used in the neighborhood; the small coal-field at Ballycastle in Antrim, is of no economical importance. The province of Connaught affords beds of coal in Leitrim, Roscommon, and Sligo, but rarely exceeding three or four inches in thickness. The Munster coal-fields are in the counties of Cork, Kerry, and Limerick. The chief coal-district, however, is that of Leinster, in Carlow, Kilkenny, and the Queen's County. This coal, as well as that of the Munster district, is anthracite; that of Connaught is bituminous. The native coal is only used in the districts where it is raised, and neither the quantity nor the quality has been found such as to interfere with the importation of coal from Great Britain, which probably exceeds 1,000,000 of tons annually.

More notable in Ireland are the unstratified igneous rocks, of which many varieties are found. Trap-rocks exist in various parts of the country, but more especially in Antrim, where they are found in great variety. The basaltic columns of Fairhead and the Giant's Causeway form one of the most interesting geological districts in the British empire. The trap-rocks often repose on the indurated chalk of Antrim, especially in Rathlin Island and at Cushendole. At the latter place beds of trap and the chalk alternate. Of quartz rock, the chief development in Ireland is in Mayo and Donegal; it appears, also, in the peninsula of Howth and Dublin, the summits of the Sugar-Loaf Mountains, and Bray Head, in Wicklow, and in the district of Forth, in Wexford. No tertiary formation has been discovered in Ireland, except the clays containing lignite or wood-coal on the southern shore of Lough Neagh.

The elevation of the surface of Ireland is stated in the following table from the Land Tenure Commissioners' map:

	Square miles.
Between sea-level and 250 feet in height.....	13,242
" 250 and 500 feet.....	11,797
" 500 " 1000 ".....	6,797
" 1000 " 2000 ".....	1,589
Above 2000 feet in height.....	824
Total.....	32,509

The highest peaks in the chief mountain groups are:

	Feet.
Carntual, M'Gillicuddy's Reeks, Co. Kerry....	3,414
Lugnaquilla, Wicklow.....	3,089
Slieve Donard, Mourne Mountains, Co. Down.....	2,796
Mulree, Co. Mayo.....	2,688
Comeragh, Co. Waterford.....	2,597
Errigal, Co. Donegal.....	2,462
Trosnan, Co. Antrim.....	1,810

If the possession of numerous fine bays and harbors made a country great as a commercial and maritime power, Ireland would be second to none in Europe. Pre-eminent even in Ireland is the magnificent harbor of Cork, securely land-locked, protected by strong batteries, and used as the only naval station on the Irish coast. Baltimore Harbor, Skull, Cape Clear, Crookhaven, Dunmanus and Bantry Bay, are all of sufficient

depth and capacity for large vessels. On the western coast are Berehaven, Kenmare River, Valentia, Ventry, Smerwick, Brandon Bay, the estuary of the Shannon, Galway Bay, Roundstone Bay, Ardhear or Clifden, Ballynakill and Killery Harbors, Clew, Blackrod, and Killala Bays, with many others of less importance. On the northern coast are Milroy Harbor, and the fine gulfs of Lough Swilly and Lough Foyle. The eastern coast has been less favored by nature, and furnishes only one bay, with sufficient depth of water for the largest vessels, that of Strangford. The Bay of Dublin, which is much exposed, contains the fine artificial Harbor of Kingstown. Belfast, Newry, Drogheda, Wicklow, Arklow, and Wexford, have all been converted into ports, but are naturally deficient in the requisites for good harbors. Between Wexford and Cork is the fine Estuary of Waterford, formed by the confluence of the Rivers Suir, Nore, and Barrow. Altogether, Ireland possesses 14 harbors for the largest ships, 17 for frigates, from 30 to 40 for merchant vessels, with many good summer roadsteads, and an infinity of small harbors for fishing-boats. The islands off the coast of Ireland are numerous, but generally of small size; the largest are Rathlin and Tory in the north; Achill, Clare, the South Arran Islands, and Valentia, in the west; and Whiddy and Cape Clear in the south.

Lakes.—The lakes in Ireland are numerous. Lough Neagh, in Ulster, is the largest inland lake in the United Kingdom, and is only exceeded in Europe by Lake Ladoga in Russia, Lake Vener in Sweden, and the Lake of Geneva. According to the Ordnance Survey it covers 98,255 statute acres. The River Bann, passing through it, affords the means of lowering its surface, which is 48 feet above the sea at low water; but as its deepest part is beneath the level of low water, total drainage would be impracticable. Tradition states that it was once dry land, and that the tops of buildings may at times be seen in it—a legend which has been made use of by Moore in one of his melodies. Lough Neagh contains but one islet, Ram Island, remarkable only for a round tower, and as contributing to break the sameness of the surface of the lake, which, being surrounded by shores almost as level as itself, and generally bare of wood, has little or none of the picturesque beauty which renders Lough Erne and Killarney so delightful. Its vicinity to the five counties of Ulster, Antrim, Down, Armagh, Tyrone, and Londonderry, each of which its waters touch, presents great advantages for internal trade by inland navigation; steam vessels have been placed upon the lake, and, in conjunction with Coal Island, Newry, Ulster, and Lagan Canals, Lough Neagh, with its 100 miles of coast, promises to increase in importance as a centre of internal traffic. Lough Erne, the next in size, lies wholly within the county of Fermanagh. Its total length is upward of 40 miles, but its greatest breadth is not more than 8. Strictly speaking, it consists of two lakes, about 5 miles apart; the more inland measuring about 14 miles in length, and that nearer the

sea, 25. They are connected with each other by a fine river flowing from the upper or southern, into the lower or northern lake. On the island formed by the division of this river into two branches, the chief part of the town of Enniskillen is built. The upper lake covers 9278 statute acres, and contains about 90 islands; the lower and larger lake contains nearly 28,000 statute acres and numerous islets. Its coasts are studded with numerous seats and villas of much beauty. Lough Corrib and Lough Mask, in the west of Connaught, are separated from each other by an isthmus not more than 3 miles broad. The former of these lakes covers an area of 43,484 acres, and the latter, 22,219. It discharges its waters into Galway Bay by a short but broad and rapid river, which skirts the town of Galway. Its level is but 14 feet above that of the sea, and works have long been in progress to connect the navigation of the bay with that of the two great lakes above it. Means of connecting them by water communication has not yet been effected. Further north, and about 3 miles from Ballina, is the narrow lake of Lough Conn, 12 miles long. The lakes of Killarney, in Kerry, have long been celebrated for their picturesque scenery. They are small as compared with the larger lakes of Ireland; the lower lake covers 5001 acres, the middle lake 680 acres, and the upper lake only 480 acres. Lough Derg, in the south of Donegal, is small, but of great celebrity from an islet in it, called St. Patrick's Purgatory, which has been resorted to from time immemorial as a place of penance by pilgrims of the Roman Catholic persuasion. This lake is not to be confounded with the great Lough Dearg lying on the course of the Shannon, which contains 29,570 acres. Lough Gill, in Sligo, Lough Shelin to the north of Meath, and Lough Oughter, in Cavan, are also worthy of notice for their scenic beauties. There are many other lakes of small size in most parts of Ireland, but chiefly in the counties of Cavan, Westmeath, and Longford.

Ireland contains not only the largest lake, but also the largest river in the United Kingdom—the Shannon, which, rising in the mountains on the confines of Fermanagh and Leitrim, flows through Lough Allen, and thence in a south-western direction, separating Connaught from Leinster, till, arriving at Limerick, it turns westward, and discharges itself into the Atlantic, through a fine estuary, which, at its entrance between the Capes of Loophead and Kerryhead, is 8 miles wide. It is navigable for large vessels to Limerick, and for vessels of smaller tonnage to within 5 miles of its source in Lough Allen. Its centre length measures 240 miles, and in consequence of the small amount of its fall, which does not exceed 150 feet, its current is very slow and often imperceptible. During its passage from Lough Allen to Limerick it expands into the large lakes of Lough Reagh, 15 miles, and Lough Dearg, 21 miles in length, and studded with numerous islets. The Blackwater rises near Charleville, and, flowing south-eastward, discharges itself into the Atlantic at Youghal, after forming the boundary between the counties of Cork and Waterford. Between the latter county and that of Wexford is the estuary of the Suir, the Nore, and the Barrow, all of which have their sources not far from each other in the central range of the Slievebloom Mountains; and, after diverging so that their streams enrich a great portion of the provinces of Leinster and Munster, unite again near the city of Waterford. The Slaney rises in the mountains of Wicklow, and empties itself into St. George's Channel at Wexford. The Boyne, famous for its historical recollections as well as for its natural advantages, has its sources in the central elevated plain of Leinster, and, flowing north-eastward, falls into the Irish Sea at Drogheda. The Bann rises in the Mourne Mountains, flows northward through Lough Neagh, and, after separating the counties of Londonderry and Antrim, flows into the Atlantic at

Coleraine. The Foyle is formed by the union of the streams of the Poe, the Mourne, the Finn, and the Derg, which, flowing from different parts of the interior of Ulster, discharge their combined waters into Lough Foyle near Londonderry. The Erne, which flows from Lough Erne, has a short but rapid course to the Atlantic westward, and discharges its great body of waters into Donegal Bay, over a ledge of rocks rising 10 feet above the level of the ordinary tides. The other rivers, though numerous, amounting nearly to 100, are small, and mostly confined to the counties that give them birth. The Liffey, which rises in the mountain-land of Wicklow, and, after a circuitous course through Kildare, discharges itself into the Irish Sea, is remarkable for nothing except that the metropolitan city of Dublin is seated on its banks.

The extent of country forming the basin from whence each of the principal rivers derives its supply, is as follows:

	Sq. miles.		Sq. miles.
Shannon.....	4-544	Lee.....	735
Barrow, Nore, and Suir	8-400	Liffey.....	568

Ireland was once so thickly covered with timber as to receive the name of the Island of the Woods. During the early periods of its connection with England, its extensive and impenetrable forests formed a main obstacle to the progress of the English troops. Westminster Hall is said to be roofed with oak cut in the woods of Shillelagh. Numerous trunks of large trees are constantly found in the bogs. Even in mountain tracts, devoted for a long succession of years to the pasturage of sheep, timber trees shoot up spontaneously wherever the land is secured from the intrusions of cattle. Many places, where the vestige of a plantation is not to be seen, retain names of which the word "wood" forms a component part; and in localities where the most attentive culture will not suffice to keep any tree or shrub alive on account of the western blasts, large trees are found imbedded in the bogs. The different kinds of timber found in the bogs of Ireland are confined to oak, fir, yew, holly, saw, and birch. Two centuries ago, when Ireland was covered with forests, there were numerous small iron-works, in which wood charcoal was employed, and vast quantities of wood used until the country was gradually stripped of its supply, and the working of iron was consequently abandoned. The extension of agricultural improvement, and more especially the timber act, which gives the tenant at the expiration of his lease, a pecuniary interest in the trees he has planted, are gradually removing this defect, the consequence of ages of disturbance and desolation; but trees in large quantities are generally found in Ireland only in the vicinity of the residences of the gentry, except in some favored spots, which are well wooded.

Minerals.—Ireland is reputed to contain much lead, copper, and iron, but notwithstanding many attempts to work the metallic mines discovered in the country, few have been found sufficiently productive to repay the necessary outlay of capital. Toward the close of the last century, gold was discovered, accidentally, in the streams flowing from the Mountain of Croghan Kinsela, on the confines of Wicklow and Wexford. The metal was found in lumps and small pieces down to the minutest grain. Many of the peasants having ruined themselves by leaving their proper occupations to join the search, the government, to put an end to the fruitless quest, took up the enterprise, and only relinquished it after satisfying the seekers of its worthlessness. "The gold is associated with magnetic iron-stone, sometimes in masses of half a hundred weight;

also iron pyrites, brown and red hematite, wolfram, manganese, and fragments of tinstone in crystals, together with quartz. From the nature of these attendant minerals, of which most are known to occur in the quartz veins of the adjacent mountain, it was hoped that by tracing up the rivulets to their sources, and laying bare in various directions the underlying rock, the metalliferous veins might be discovered, from the disintegration of which the sand and soil of the bed of the streams had been produced. All such trials proved useless, and the question as to the source from whence the gold in those streams in Wicklow has been derived, remains still unanswered."—Sir R. KANE'S *Industrial Resources of Ireland*. Copper ores are distributed throughout the clay-slate districts in a great number of localities more or less abundantly. The principal mines are those of Ballymurtagh, Conoree, Cronebane and Tigroney, and Ballygahan, in Wicklow county; the Knockmahon, Kilduane, Bonmahon, and Balinasilla, in the Waterford district; Allihies or Berehaven, Audley, and Cosheen, and Skull, in the south-western district; and the mines of Hollyford and Lackamor, in the western district.

The total quantity and value of copper ore from Ireland, sold in Swansea, where it is smelted, were, in

Years.	Tons.	Value.	Years.	Tons.	Value.

Lead is more extensively diffused through Ireland than copper. The granitic district of Wicklow contains numerous veins; the principal are those of Glendalough, Glenmalur, Glendasane or Lughanure, and Ballycorus. The clay-slate districts also yield numerous indications of this metal, but few of the mines have proved profitable. Those still worked are at Clonliff, Newtownards, and Rathmullen, in Down county; Bond and Newry, in Armagh county; Castleblayney, in Monaghan county; Kenmare, in Kerry county; Kilbricken and Ballyhickey, in Clare county; Shallee, in Limerick county; and Bantry, in Cork county. A vein at Clontarf, near Dublin, was worked until the mine was filled with water by the ingress of the sea. At Ballycorus, where the lead ores from the mines of the Mining Company of Ireland are smelted, the quantities of ore worked up in 1851 from Lughanure mines was 674 tons, which produced 460 tons of lead, equal to nearly 69 per cent. The proportions of silver to a ton of lead are generally found to be, from the mine of Lughanure, 8 oz.; Caine, 12 oz.; Ballyhickey, 15 oz.; Shallee, 25 oz.; Kilbricken, 120 oz.; Tollyratty, near Strangford, 10 oz. The average of silver extracted from the lead ore raised by the Mining Company of Ireland in 1851, was 7 oz. to the ton of lead; the total quantity 3860 oz.; producing £1029 6s. 8d.

Native silver was found in a bed of iron ochre in

Cronebane, but the deposit has been long since exhausted. Sulphuret of silver was found in the lead ore at Ballycorus some years since, and the Mining Company of Ireland have resumed operations to prove this valuable discovery. Tinstone has been found in the auriferous soil of Wicklow, but no veins or workable deposits have been discovered. Other minerals, useful in manufactures and the arts, and found in quantities in various parts of the country, are manganese, antimony, zinc, nickel, iron pyrites, alum, clays of various kinds, building stone, marble, flags, and roofing slates. Mineral springs, chiefly chalybeate, are numerous in many parts of the country. Those of chief note for their medicinal qualities are at Mallow, in Cork, resembling the hot wells of Bristol; Ballynahinch, in Down; Swanlinbar, in Cavan; Castletown, near Limerick; and Lucan, near Dublin.

The following is the result of the different estimates and census inquiries into the number of the population of Ireland at various periods:

Few countries in the world have increased in population so rapidly as Ireland during the first 40 years of the present, and the conclusion of the last century. Arthur Young, in his *Tour through Ireland*, in 1766, observed that it everywhere evinces the marks of a rapid increase of population. It is generally supposed that the number of the people increases in the ratio of food and comforts, and that an increase of population is a convincing proof of the advancing prosperity of a nation. The effect of the failure of the potato crop in depopulating the country would show that the population of Ireland had outstripped the progress of wealth, and the increase of industry, and had reduced their wants to the lowest point without procuring an addition to the comforts of life corresponding to the increase of the population.

The following table exhibits the population of each portion of the country, according to the census of 1821, 1831, 1841, and 1851, together with the house accommodation at the latter period:

Provinces.	1821.	1831.	1841.	1851.			Families.	Houses in 1851.

The chief impediment to improvement in the condition of the people of Ireland during the present century has been the redundancy of the population. In a country almost wholly dependent on the cultivation of the soil, there were in 1841 as many as 335 persons to each square mile of arable land. Perhaps, with the exception of China there was no other country in the world so densely peopled, and certainly none where the population was so disproportioned to the

means of employment. This great density of population was necessarily accompanied by an extreme competition for land and employment, with the absence of all inducements to the acquirement of skill, and in consequence of the low rate of remuneration for labor, and high rents, the impossibility of any accumulation of capital in the hands of the cultivators of the soil. The following table shows the density of the population in 1841, and its remarkable decrease in 1851:

TABLE SHOWING THE DENSITY OF POPULATION IN 1841, AND ITS REMARKABLE DECREASE IN 1851.

Ireland is naturally, both from soil and climate, a pastoral country, and it was not until the commencement of the last century that efforts were made to introduce an attention to tillage on an extended scale. Primate Boulter, when one of the Lords Justices, pressed strongly on the British government the necessity of enforcing a tillage system; and for this purpose proposed a law, in 1727, to compel landlords to till five acres out of every hundred in their possession, exclusive of meadows and bogs; and also to release tenants to the same extent from the penal covenants against tillage, inserted in their leases. Mr. McCulloch observes, in his *Statistical Account of the British Empire*, that the luxuriance of the pastures in Ireland and the heavy crops of oats raised, even with the most wretched cultivation, attest the extraordinary

fertility of the soil. Strong retentive clay soils, sandy soils, chalky and gravelly soils, and several other descriptions of soil common in England, are seldom or never met with in Ireland, which affords no great diversity as compared with Great Britain. Mr. Wakefield describes the soils of Ireland as follows:—“A great portion of the soil of Ireland throws out a luxuriant herbage, springing from a calcareous subsoil without any considerable depth. This is one species of the rich soil of Ireland, and is found throughout Roscommon, in some parts of Galway, Clare, and other districts. Some places exhibit the richest loam I ever saw turned up with a plow; this is the case throughout Meath in particular. Where such soil occurs, its fertility is so conspicuous, that it appears as if nature had determined to counteract the bad effects produced by the clumsy system of its cultivators. On the banks of the Fergus and Shannon, the land is of a different kind, but equally productive, though the surface presents the appearance of marsh. These districts are called *caucasses*: the substratum is a blue silt deposited by the sea, which seems to partake of the qualities of the upper stratum, for this land can be injured by no depth of plowing.”

The prevalent soil is a fertile loam, resting on a rocky substratum, chiefly of limestone. The depth, though in general not great, is in some parts such as to admit of a fresh vegetable mold being repeatedly thrown up by successive plowings to a greater depth. This occurrence is most striking in Meath, and in the district of the counties of Tipperary and Limerick, long distinguished by the name of the Golden Vale, from its extraordinary fertility. In some parts, particularly in Galway, the rock shows itself above the surface in ridges like waves, the interstices being filled with rich mold, which produces a thick, close sward, extremely grateful to sheep. Large tracts of grazing land similar to the Downs in England are unusual; the only tract of any extent of such description is the Curragh of Kildare, which has been used, time immemorial, for a sheep walk. The mountains are capable of tillage to a considerable height; and their summits, with the exception of a few of the very highest, are fit for pasturage in summer.

The quantity of arable land in 1841, according to the return of the Census Commissioners, was 13,464,300 acres, and in 1851, 14,802,581 acres; and the proportion per cent. of cultivated and uncultivated surface, etc., at those two periods was as follows:

Provinces.	Total area in statute acres.	Division of surface.									
		Arable land.		Uncultivated.		Plantations.		Towns.		Water.	
		Proportion per cent.		Proportion per cent.		Proportion per cent.		Proportion per cent.		Proportion per cent.

The laws which prohibited the exportation of Irish woollens to foreign countries, and to the British colonies, were repealed in 1779. By the Act of Union, the duties on woollens imported into either island were confined to those called “old and new draperies;” and the high duties of Charles II. were reduced to 8^d. per yard on the old, and 2^d. on the new draperies. By

the same act, England relaxed her monopoly so far as to permit the export of wool and woollen yarn duty free to Ireland. Previous to the Union, when the import of English wool was prohibited, the manufacture of Ireland was confined to the coarsest description of goods, for which alone the Irish wool was suited. Previous to the introduction of carding machinery the

manufacture of woollens was inconsiderable, but immediately after the Union, machinery worked by water power became general, and the trade increased, but the combinations of workmen and protecting duties rendered the Irish manufacturers unable to compete with those of Great Britain, and the trade continued

limited to the demand for home consumption. Flannels are made in Wicklow, and blankets in Kilkenny. Frieze of the coarsest kind is in some parts manufactured by the peasantry for domestic consumption, and the supply of the adjoining district.

Linen.—The same legislative measure which was intended to discourage the woolen manufacturer stated, that “if the Irish turned their industry and skill to the settling and improving of the linen manufacture, they should receive all the countenance, favor, and protection for its encouragement, and promotion to all the advantage and profit they might be capable of deriving from it.” This declaration should not lead to the inference that the manufacture had been previously unknown or disregarded in Ireland. On the contrary, the use of linen was so prevalent among the higher orders, that sumptuary laws were enacted to check its excessive use. The unfortunate Earl of Strafford seems also to have anticipated the views of the British manufacturers on the subject. Instead of extinguishing the woolen trade by exclusive duties, he labored to foster that of linen. He imported flax seed in large quantities from Holland, and held out premiums to induce Flemings and Dutchmen acquainted with the manufacture to settle in Ireland. On these laudable objects he spent upward of £30,000 of his private fortune; and his example was followed by the Duke of Ormond. Still, however, the woolen manufacture prevailed, particularly in the south and west, where the climate and extensive pasturage for sheep insured a copious and cheap supply of the raw material. In the same spirit, an act was passed by the English Parliament in 1696, to encourage foreign linen manufacturers to settle in Ireland; and with that view all articles made of flax or hemp in this country were admitted into England duty free—a privilege which is estimated to have given that branch of trade an advantage of 25 per cent. over other nations in the English market. The Irish Parliament responding to the sentiments and wishes of that of England, promised that “it would heartily endeavor to establish the linen and hempen manufacture, so as to render it useful to both kingdoms;” adding, that “it hoped to find such a temperament in respect to the woolen trade here, that the same may not be injurious to England.” The “temperament” here announced was evinced most effectually by laying prohibitory duties on the export of its own woollens, thus accepting the compact on the part of Ireland, and giving the country an in-

controvertible claim upon England for a perpetual encouragement of that branch which was to be nurtured in lieu of the natural staple of the country. In furtherance of the measures mutually agreed on between both kingdoms, a board of trustees for the encouragement of the linen manufacture was established in 1710, consisting of a number of individuals of influence in each province. Under its control a code of regulations was devised and maintained, which extended to the most minute particulars of the processes, and had the effect for many years of securing the fabric a decided preference both in the home and foreign market. A large sum was annually granted to this board for premiums and the supply of wheels and other implements, which was continued till the year 1830, when the grants were discontinued, and the board ceased to act. The flax seed is chiefly imported. Little is grown in the country, as, notwithstanding all the exertions made by the grower, the plant raised from it is considered of inferior quality.

Flax.—The first flax-spinning machinery erected in Ireland was at Cork in 1805. About 1825, English and Scotch yarns were first imported into Ireland, and undersold the spun article. The use of machinery gradually increased, and the linen manufacture soon became extinguished in the south and west, and concentrated in the north. In 1821 the yarns were all made by hand. With one or two trifling exceptions, not a spinning factory was to be seen. In 1849 there were upward of 70. In 1819, with the existence of bounties on the export of linens, and heavy duties on the admission of foreign flax and linen fabrics, only 40 millions of yarns were exported from Ireland. In 1849 these exports had increased to 75 millions. The question became not as to whether the employment of linen-weavers by extensive manufacturers, and confining them to the mere process of weaving, was or was not more advantageous than the old system, where the producer of the raw material, the weaver of the cloth, and the merchant who disposed of it, were the same individual; but whether it would be more profitable to alter the system or lose the trade.

The following tables show the value of the brown or unbleached linen sold in the several linen markets

in Ireland during a period of four years, as furnished by the returns of the seal-masters and inspectors of the Linen Board to Parliament in 1825. The sums stated in the former of these tables are the first cost paid to the manufacturer by the country purchaser; the value of most of the linen sold is afterward considerably increased by the process of bleaching and other treatment.

TOTAL OF BROWN OR UNBLEACHED LINEN SOLD IN IRELAND.

Years.	Leinster.	Ulster.	Munster.	Connaught.	Total.
	£	£	£	£	£
1822	285,854	2,066,122	68,870	117,664	2,538,510
1823	336,698	2,127,529	82,202	130,914	2,677,343
1824	207,638	1,968,180	95,195	140,856	2,411,869
1825	192,888	2,109,809	110,420	168,090	2,580,707
Total.	1,022,578	8,271,140	356,687	557,524	10,207,929

Since 1825 no returns have been kept. The number of yards of linen exported from Ireland was:

Year.	To Great Britain.	To foreign parts.	Total.
1800.....	No separate returns.		35,676,908
1801.....	84,622,898	3,288,704	37,911,602
1809.....	38,018,884	4,147,515	37,166,399
1813.....	35,018,884	3,926,731	38,945,615
1817.....	50,290,321	5,940,254	56,230,575
1821.....	45,519,509	4,011,630	49,531,139
1825.....	52,560,926	2,553,589	55,114,515
1835.....	60,916,592

The apparent amount of exports of linen from Ireland is now small, arising from the fact, that nearly all is sent by cross-channel steamers to the English and Scotch ports, whence it is transhipped to foreign countries. The entire export from Ireland to Great Britain and all foreign countries reaches about 106,000,000 yards; value, £4,400,000. The following table shows a comparison of the production and value of the yarns made, and amount of wages paid, in an interval of ten years:

	Bundles of yarn produced.	Value.	Wages paid.
1840.....	5,000,000	£1,500,000	£208,000
1850.....	7,400,000	1,942,500	817,000

The cotton manufacture was introduced in 1777, and became an object of attention to the Irish Parliament, which endeavored to secure a monopoly of the home market by high import duties and bounties. The first cotton mills were erected at Prosperous, in the county of Kildare, and in Belfast, about the year 1784. From that period till the Union, it thrived, in consequence of the measures adopted to prevent foreign competition. At the Union it was arranged that the then existing duties should continue for eight years, after which they were to be gradually lowered, by eight annual reductions, in such manner that, after the year 1816, they should stand at 10 per cent. *ad valorem*. The progress of the manufacture has been very slow as compared with that of Great Britain. The alteration of the scale of duties materially affected the home demand, and the immense capital and great superiority of the British artist have contributed much to secure to his manufacture a preference in the foreign market. In 1822 the quantity of cotton wool imported was 3,755,024 lbs., and of cotton yarn, 1,197,294 lbs.; leaving a total quantity of 4,576,816 lbs. of cotton yarn consumed, after allowing 10 per cent. for waste, etc., on the cotton imported.

Silk and Lace.—The silk manufacture was introduced into Ireland in 1693, by French emigrants after the revocation of the Edict of Nantes. Its seat was the city of Dublin, where it was maintained by the aid of protecting duties. Some feeble attempts to fix it in the country parts failed completely. The last of these was so lately as 1825, when a company was formed for the purpose of fixing the trade on a secure basis in the south of Ireland, by earing the silk-worm there, and thus having the benefit of the raw material for the labor of producing it; but after considerable expense had been incurred for the purchase of ground

and the planting of mulberry-trees, the scheme was relinquished as hopeless. One branch of the manufacture, a fabric of mixed worsted and silk, known by the name of tabinet, or Irish poplin, is in considerable demand, both at home and elsewhere, for the richness and beauty of the texture. It is almost the only branch now flourishing. The general trade has been nearly annihilated by the removal of the protecting duties in 1821, after which, in consequence of the combination of the workmen to keep up the rate of wages, the Irish manufacturer became unable to compete successfully with the English trade. The manufacture of lace is carried on to some extent in Limerick, and of late years a great source of employment for females has been introduced in the working of patterns on muslin with the needle.

Metals.—Manufactures in metal exist only to a small extent; and the making of glass, which was once carried on largely, has declined.

Provisions.—The provision trade, together with the exportation of the agricultural produce of the country, has always been, and will probably long remain, the principal commercial business carried on in Ireland. This export trade is mainly with Great Britain, to Liverpool, Bristol, and Glasgow, from Belfast, Dundalk, Drogheda, Newry, Waterford, Limerick, and more particularly from Cork and Dublin. In 1825, 181,276 barrels of beef and pork, 362,278 cwt. of bacon and hams, 474,161 cwt. of butter, and 85,279 cwt. of lard, were exported. Since that period the provision trade has vastly increased; but in consequence of the cessation of the duties on the cross-channel trade, there are no means of accurately ascertaining the present extent of the trade.

The following table shows the number of gallons of Irish spirits brought to charge since 1840, and the amount of duty:

Years.	Gallons.	Duty.
1840.....	10,815,709	£1,261,882
1841.....	7,401,051	936,126
1842.....	6,485,448	864,725
1843.....	5,290,650	904,908
1844.....	5,546,483	852,418
1845.....	6,451,187	860,151
1846.....	7,605,196	1,014,026
1847.....	7,952,076	1,060,276
1848.....	5,737,687	804,984
1849.....	8,126,507	948,057
1850.....	6,973,833	929,777
1851.....	7,408,086	957,774
1852.....	7,550,518	1,006,735
1853.....	8,208,256	1,094,434
1854.....	8,136,362	1,273,151

The principle of extracting the largest possible amount of revenue from the duty on spirits having been adopted, the rate was raised in 1855 to 6s. 2d. per gallon, when the number of gallons brought to charge declined to 6,228,856, and the maximum rate of duty productive to the revenue appears to have been attained, if not exceeded. There are breweries in most of the large towns in Ireland, the produce of which has superseded the use of beer imported from Great Britain, and also furnishes a quantity sufficient for a large export trade, which has of late years much increased.

The external trade of Ireland branches out into two great divisions, the cross-channel trade with Great Britain, and the commerce with foreign nations. The relative importance of each port, as respects its commercial character, will appear from the first and second tables following, which contain a specification of the number and tonnage of vessels that entered and cleared out coastwise, from and to the British colonies and foreign countries in 1853, in each of the ports of Ireland; while the progress of domestic navigation will appear from the third and fourth tables, containing a summary, in triennial periods, of the tonnage of ships belonging to and registered at the different ports in Ireland, and of the number and tonnage of those employed in the cross-channel trade.

NUMBER AND TONNAGE OF SAILING VESSELS AND STEAM VESSELS THAT ENTERED AND CLEARED OUT COASTWISE AT EACH OF THE PORTS IN IRELAND IN THE YEAR 1853.

NUMBER AND TONNAGE OF VESSELS EMPLOYED IN THE INTERCOURSE BETWEEN GREAT BRITAIN AND IRELAND, WHICH ENTERED INWARD AND CLEARED OUTWARD WITH CARGOES, AT THE PORTS OF THE UNITED KINGDOM DURING FOUR YEARS.

	1852.		1853.		1854.	
	Vessels.	Tonnage.	Vessels.	Tonnage.	Vessels.	Tonnage.
Inward.....	9,406	1,762,197	9,840	1,931,939	10,606	2,042,146
Outward.....	13,676	2,409,905	19,244	2,594,555	20,685	2,819,395

These tables exhibit the great preponderance of the cross-channel trade, which has been greatly augmented since the introduction of steam navigation. The earliest attempts at establishing a company for this purpose were made in Dublin about the year 1816. Two small vessels were fitted up, but the construction of their machinery was faulty, their dimensions were too small, and the effort proved abortive. The cross-channel trade, with the exception of that in coal, is almost wholly carried on by means of steam-vessels; but since 1825, when the trade between Great Britain and Ireland was placed upon the footing of a coasting

trade, no separate returns have been made out at the custom-house of the quantity and value of the exports and imports.

Fisheries.—The coasts of Ireland abound with fish; and Sir William Temple observed, "that the fishery of Ireland, if improved, would prove a mine under water, as rich as any under ground." Arthur Young also remarks, "that there is scarcely a part of Ireland but what is well situated for some fishery of consequence; and that her coasts, of innumerable creeks and river mouths, are the resort of vast shoals of herrings, cod, ling, hake, and mackerel.

Revenue.—Before the arrival of the English, the revenues of Ireland were paid in cattle; and even after that period the custom prevailed for several centuries in the parts less subject to foreign influence. Traces of it have been met with so late as the reign of Elizabeth. The new government, under the English, introduced the method of raising money by subsidies. John exacted a subsidy from the Irish clergy, and established the court of exchequer for the general management of the revenue. The same method was continued during the reigns of Henry III., and the first Edwards; but the income thus extracted from the people proved so inadequate to meet the expenditure, that recourse was had to the legalized extortion of coyne and livery, which was the levying of man's meat and horse's meat for the soldiery in time of service. The amount of the regular revenue, in the reign of Edward III., is stated by Walsingham and Holingshead to have been £30,000; but Sir John Davis, who collected his information from the pipe-rolls, and other authentic sources, reduces it to £10,000. The most remarkable financial measure of Richard II. was a tax upon absentees. In 1433, the eleventh of Henry VI., the revenue was reduced to £2,339 18s. 6d., while the expenses of the government were £2,348, 16s. 11½d., thus exceeding the income by £18, 17s. 5½d. At the latter end of the same reign, the Duke of York, when sent over as lord-lieutenant with extraordinary powers, not only obtained the whole revenue, but stipulated for an additional supply from England of 4,000 marks for the first year, and £2,000 for every year thereafter. Edward IV. raised money by the imposition of duties on all merchandise sold in Ireland except hides. In the 15th year of Henry VII. a duty of one shilling in the pound was laid on all merchandise imported and exported, except wine and oil; and

a tax, by way of subsidy, of 13s. 4d. on every hide of land. During this reign the revenue seldom exceeded £5000. Henry VIII. increased the revenue by the suppression of monasteries. The laws against absentees were also enforced. During the first 15 years of Elizabeth, the revenue was £120,000, or £8000 per annum, while the expenses amounted to £490,779, 7s. 6½d. In 1599, at the close of Tyrone's rebellion, £600,000 were spent in six months; and Sir Robert Cecil affirmed that Ireland had cost the queen £3,400,000 in ten years' time. In the pacific reign of James the customs increased from £50 to £3000, and at the close of his reign to £9700. The wardships and other feudal rights produced about £10,000, notwithstanding which the income was inadequate to the expenditure. To defray the expense of the army, an order of baronets was established by which £98,500 were raised, in addition to which £247,433 were remitted from England to clear off the debts incurred by Elizabeth. The Irish Parliament granted the same king a subsidy of 2s. 8d. in £1 on every personal estate of £3 annual value, and 4d. in £1 on every real estate of £1 value; an act of liberality with which James was so much pleased, that he declared "he would hereafter hold his Irish subjects in equal favor with those of his other kingdoms." In the succeeding reign Strafford raised the customs to four times their previous amount. In the same reign the first mention is made of an excise tax. Thurloe, however, in his state papers, mentions that the revenue for two years ending in 1657, amounted to £137,558, while the expenditure was £142,509. When the Irish Parliament met after the Restoration, it granted, first, an hereditary revenue to the king, his heirs, and successors; second, an excise for maintaining the army; third, the subsidy of tonnage and poundage for the navy; and, fourth, a tax of 2s. each on hearths, in lieu of the feudal burdens, which were then abolished. After the Revolution, the information respecting this important element of the national statistics becomes more precise and satisfactory.

The revenue, from the landing of Schomberg in 1689 till the end of the reign of William, was as follows, the total on the previous military expenditure of the war with James having amounted to £3,861,655:

Year.	Revenue.	Year.	Revenue.
1689.....	£3,894	1696.....	£213,584
1690.....	93,910	1697.....	548,967
1691.....	274,949	1698.....	601,346
1692.....	893,926	1699.....	701,982
1693.....	444,183	1700.....	766,690
1694.....	430,534	1701.....	697,855
1695.....	438,304	1702.....	551,286

During the earlier part of Anne's reign the income exceeded half a million, but in her latter days it was less productive. In the reign of George I. the state of the revenue continued nearly as in the preceding reign. In that of George II. there was a surplus, which was applied, not always judiciously, to public works. The national debt of Ireland, incurred by an excess of expenditure beyond the income of the country, increased with great rapidity toward the close of the last century and till the year 1817, when it ceased to form a separate item in the public accounts, in consequence of the consolidation of the British and Irish exchequers. Its progressive increase since the Revolution is exhibited in the following table:

PUBLIC DEBT OF IRELAND.

1716.....	£16,106	1770.....	£628,888
1720.....	87,511	1780.....	1,067,565
1730.....	220,730	1790.....	1,586,067
1740.....	296,988	1800.....	22,245,190
1750.....	205,117	1810.....	75,240,790
1762.....	223,488	1817.....	134,602,769

The following table gives an account of the gross revenue levied in Ireland, in each year from 1840 to 1853; distinguishing the expenses of collection and the other payments out of the revenue in its way to the exchequer; also an account of the amount of repayments into the exchequer on account of advances for public works, employment of the poor, distress, etc., in Ireland, for the like period.

GROSS REVENUE LEVIED IN IRELAND, IN EACH YEAR FROM 1840 TO 1853.

Years.	REVENUE.			CHARGES.				Total Charges.	Payments on account of Public Works, etc.	Payments on account of Revenue.
	Balances outstanding.	Gross revenue.	Total Income.	Charges of collection.	Payments to the Exchequer.	Payments on account of Revenue.	Balances at the end of the year.

The circulating medium in Ireland was, until lately, subject to a great variety of alterations. Without entering into the disputed question of the existence of a

mint in Ireland established by the Ostemen or Danes, the first certain account of a mint there is that established in 1210, by King John, who caused pennies,

halfpennies, and farthings to be coined and made current by proclamation. Further coinages were made by Henry III. and by Edward I., who added the title of *DOMINUS HIBERNIE* to that of *REX ANGLIE* on his Irish coinage. It consisted of groats, halfpence, and farthings. The first important alteration as to value was in the latter part of the reign of Edward III. who caused the ounce of silver to be cut into 26 deniers or pennies, instead of 20, as before, which caused the depreciation of $8\frac{1}{2}$ per cent. in the Irish, as compared with the British currency, which existed until the final assimilation of the two currencies in 1825. Henry VI., or rather the Duke of York, his lieutenant in Ireland, had mints in Dublin and Trim, in which both silver and copper money were coined.

In the beginning of the subsequent reign of Edward IV. the value of silver coins was raised to double their previous amount. The consequence was an enormous increase of price in all the necessaries of life; to remedy which, the Irish Parliament enacted, that the master of the mint should strike, in the Castles of Dublin and Trim, and in the town of Drogheda, five kinds of silver coins; the gross (or groat), the demi-gross, the denier (or penny), the demi-denier, and quadrant (or farthing); eleven groats to weigh an ounce troy, and each, unclipped, to pass for fourpence. A few years afterward, the price of silver was again raised so excessively, that the difference between the Irish and English groat was 50 per cent. in a pound of bullion. In the reign of Henry VII. the difference between the two coinages was one third. Soon after the accession of Henry VIII. the coin in Ireland was so clipped, defaced, and scarce, that the Earl of Surrey, then lord-lieutenant, sued for his recall, in consequence of the want of money to carry on the war against the Irish. Elizabeth ordered the ounce of silver to be cut into 60 pennies, so that the coin of that name was reduced in weight from the 20th to the 60th part of an ounce. The total value of the money coined in Ireland by that princess, is said to have been £94,577 10s. 6d. English, which, at the rate of 16d. Irish, for a shilling English, amounts to £118,222 9s. 4½d. Irish. The Irish shilling, or harp, as it was called, from the impression on its reverse, was worth ninepence English. By a proclamation issued in the fifth year of James I. the same proportion of values was continued. In 1713 English money was current in Ireland at an increased value; the English five-shilling crown-piece passing for six shillings and eightpence, and the other coins in proportion. The exchange between Dublin and London was 21s. Irish for 15s. English, with 6d. or 8d. per pound extra, payable in London. By a proclamation in 1637, the name of Irish money was ordered to be abolished, and all payments were reduced to English sterling money. About 1672, small change was so scarce in Ireland, that towns and private dealers were obliged to issue copper tokens. Jame II., on his arrival in Dublin in 1688, issued a proclamation, by which the English guinea was to pass current at £1 4s., the crown-piece at 5s. 5d., and all lesser coins in the same proportion. In 1690, he depreciated still further the value of the coin, by the issue of pieces of base metal, which were to pass at a nominal value far above their intrinsic worth; so that the coins issued of the nominal value of £965,375 according to some, but, according to others, of £1,596,799, were really worth no more than £6495, estimating the metal at 4d. per pound. On the accession of William, this coinage was cried down. In 1725, the new gold coin of Portugal was made current in Ireland, the largest coin, or Portugal piece, being rated at £4. About the same time, in consequence of the scarcity of small change, Wood obtained his patent for the issue of a copper currency, which was prevented by the literary exertions of Dean Swift in his celebrated publications called the *Drapier's Letters*. In 1780, the acts of Parliament prohibiting the carrying of gold or silver into

Ireland were repealed. At that time the value of precious metals in circulation as specie, or hoarded, was estimated at £3,000,000 Irish. No further legislative change took place until the assimilation of the Irish and English currency in 1825, previously to which, however, the want of a metallic circulation was so severely felt, particularly during some periods of the French war, that private bankers and traders issued notes or tickets for small sums, from 5s. down to twopence-halfpenny; and also copper tokens. The evils of this combined pressure of the scarcity of legal and the abundance of counterfeit coin, was ultimately remedied by the issue of stamped dollars estimated at 6s., and by silver tokens of 10d. and 5d., by the bank of Ireland, which circulated freely until they were replaced by the issue of a pure standard coinage of silver from the royal mint.

The amount of subscriptions raised in England for the relief of sufferers by the famine of 1822 having exceeded the expenditure, the surplus was intrusted to a committee in London, and was retained under the name of the Irish Reproductive Loan Fund, as a permanent fund for organizing loan societies, ultimately originated the present loan fund system, under which small sums are advanced to industrious individuals of the working classes, to be repaid by instalments, with interest, and which was placed under the control of a commission in 1836 by the Act 6th and 7th Will. IV., chap. 55. The rate of discount on loans, made chargeable by it at 6d. in the pound, has been reduced to 4d. in the pound by the Act of 6th and 7th Vict., c. 91, which placed the general control over all charitable loan societies and charitable pawn or deposit offices under the superintendence of the "Loan Fund Board." The number of funds, with their capital and circulation since the commencement of the system, has been

Pawn offices, on the plan and under the name of the French *Monts de Piété*, were opened in several towns of Ireland in 1841, with the object of advancing money on pledges at rates more moderate than those of the licensed pawnbrokers; but all have since been discontinued. By means of navigable rivers and canals, Ireland possesses extensive inland navigation. For the details of the various canals, see CANALS. The railway from Dublin to Kingstown, which was opened at the latter end of 1834, was the first, and for several years the only railway in Ireland.

Banks.—The entire banking business of Ireland, until 1783, was in the hands of private individuals, who often issued notes to an amount not only far beyond their respective capitals, but exceeding, in a great degree, what the wants of the country required, or its credit could support. To remedy the evil effects of a system so pernicious, a national bank was established in that year, with similar privileges to those of the Bank of England in respect to the restriction of more than six partners in a private bank. The injury that Ireland has sustained from the repeated failure of banks may be mainly attributed to this injudicious regulation. The loss that the country has suffered by the failure of banks may be described in a few words. On the ex-

piry of the Bank of Ireland's charter in 1838, it was continued by act of Parliament from year to year until 1845, since which time it has been regulated by the new Banking Act, 8th and 9th Vict., c. 37, according to the following principles:—The bank to continue the banker of government, which is to pay for the 10 subsequent years $\frac{3}{4}$ per cent. on the debt it owes to the bank. The proceedings of the establishment to be

under the same rule which has been applied by Parliament to other banking institutions, and to make weekly returns, similar to those of the Bank of England under the new act, containing a full development of its affairs, the amount of its bullion, and the variations in the quantity. The joint-stock banks now doing business are as follows. Those marked (*) do not issue their own notes:

Savings-banks were introduced into Ireland in 1810. The greatest amount deposited was in 1845, previous to the years of distress consequent on the famine; and the fluctuations which have since taken place appear in the annexed table:

Years.	Depositors.	Amount.	Years.	Depositors.	Amount.
1845.....	96,422	\$2,921,531	1850.....	47,937	\$1,291,798
1846.....	93,553	2,855,827	1851.....	49,554	1,347,617
1847.....	80,351	2,410,720	1852.....	52,142	1,447,315
1848.....	43,512	1,334,296	1853.....	55,630	1,536,010
1849.....	45,543	1,200,273			

The internal traffic of the country is carried on chiefly by wheel-carriage roads. Their condition, both as to lines of direction and mode of construction, is excellent. Materials for the construction and repairs of roads are very generally distributed throughout the whole island, either in quarries, ridges, and masses of gravel, or in the beds or channels of rivers and streams. The limestone, which is the general substratum of the greater part of the country, is the best material for their formation; and the system known

under the name of macadamizing was long and successfully practiced on many of the leading lines of road in Ireland before it was thought of in Great Britain.

The progress and condition of the Irish railway system from 1836 to 1854, inclusive, may be seen in the following tables, compiled from the Board of Trade Returns:

Years ending 30th June.	Miles open on the 1st January in each year.	No. of passengers.	Receipts.		
			From passengers.	From goods.	Total.
1836 (15 mos.)	6	1,287,800	£25,816	£105	£25,421

E. B.

Iris, or Orris-Root Plant (*iris florentis*), a perennial, native of Carniola, and common in the gardens of Europe, the root of which is remarkable for communicating an odor like that of violets, and produces the orris of the shops. The flowers, which put forth in spring, are noted for the graceful curve of their petals, as well as for the brilliancy of their hues. It has a thick, tuberous, creeping stem, usually called its root, which, externally, is brown and yellowish, is white within, and sends out numerous fibres—the true roots—from the lower part. When these are pared off, the stem appears full of round spots. Independent of the value which would be derived from the roots of this plant, it would be highly desirable to cultivate it for the purposes of ornament, in all parts of the country where it would thrive.

Iron (Dan. *Jern*; Du. *Yzer*; Fr. *Fer*; Ger. *Eisen*; It. *Ferro*; Lat. *Ferrum*, *Mars*; Pol. *Żelazo*; Por. *Ferro*; Rus. *Scheleso*; Sp. *Hierro*; Sw. *Jern*; Gr. *Σιδήρος*; Sans. *Loha*; Arab. *Hedeed*; Pers. *Ahun*), the most abundant and most useful of all the metals. It is of bluish-white color, and when polished has a great deal of brilliancy. It has a styptic taste, and emits a smell when rubbed. Its hardness exceeds that of most other metals; and it may be rendered harder than most bodies by being converted into steel. Its specific gravity varies from 7·6 to 7·8. It is attracted by the magnet or loadstone, and is itself the substance which constitutes the loadstone. But when iron is perfectly pure, it retains the magnetic virtue for a very short time. It is malleable in every temperature, and its malleability increases in proportion as the temperature augments; but it can not be hammered out nearly as thin as gold or silver, or even copper. Its ductility, is, however, more perfect; for it may be drawn out into wire as fine at least as a human hair. Its tenacity is such, that an iron wire 0·078 of an inch in diameter is capable of supporting 549·25 lbs. avoirdupois without breaking. *Historical Notice.*—Iron, though the most common, is the most difficult of all the metals to obtain in a state fit for use; and the discovery of the method of working it seems to have been posterior to the use of gold, silver, and copper. We are wholly ignorant of the steps by which men were led to practice the process required to fuse it and render it malleable. It is certain, however, that it was prepared in ancient Egypt, and some other countries, at a very remote epoch; but it was very little used in Greece till after the Trojan war. (See the admirable work of M. Goguet on the origin of Laws, Arts, &c.) Iron was found on Mount Ida by Dactyles,

owing to the forests of the mount having being burnt by lightning, 1432 B. C.—*Arundelian Marbles*. The Greeks ascribe the discovery of iron to themselves, and referred glass to the Phœnicians; but Moses relates that iron was wrought by Tubal-Cain. Iron furnaces among the Romans were unprovided with bellows, but were placed on eminences with the grate in the direction of the prevailing winds. Swedish iron is very celebrated, and Daunemora is the greatest mine of Sweden. British iron was cast by Ralph Page and Peter Baude, in Sussex, in 1543.—*Reymer's Federa*. Iron-mills were first used for slitting iron into bars for smiths by Godfrey Rochs, in 1590. Tinning of iron was first introduced from Bohemia in 1681. There are upward of 800,000 tons of iron produced annually in England.—*Haydn*. There are many varieties of iron, which artists distinguish by particular names; but all of them may be reduced under one or other of the three following classes; *cast or pig iron, wrought or soft iron, and steel*. 1. Cast or pig iron is the name given to this metal when first extracted from its ores. The ores from which iron is usually obtained are composed of oxyd of iron and clay. The object of the manufacturer is to reduce the oxyd to the metallic state, and to separate all the clay with which it is combined. This is effected by a peculiar process; and the iron, being exposed to strong heat in furnaces, and melted, runs out into molds prepared for its reception, and obtains the name of cast or pig iron. The cast iron thus obtained is distinguished by manufacturers into different varieties, from its color and other qualities. Of these the following are the most remarkable:

White cast iron, which is extremely hard and brittle, and appears to be composed of a congeries of small crystals. It can neither be filed, bored, nor bent, and is very apt to break when suddenly heated or cooled.

Gray or mottled cast iron, so called from the inequality of its color. Its texture is granulated. It is much softer and less brittle than the last variety, and may be cut, bored, and turned on the lathe. Cannons are made of it.

Black cast iron is the most unequal in its texture, the most fusible, and least cohesive, of the three.

Wrought or soft iron is prepared from cast iron by a process termed a refinement or finery. The wrought iron manufactured in Sweden is reckoned the finest in the world.

Steel consists of pieces of wrought iron hardened by a peculiar process. The Swedish iron imported into this country is mostly used in the manufacture of steel.—*THOMSON'S Chemistry*.

Uses of Iron.—To enumerate the various uses of iron would require a lengthened dissertation. No one who reflects for a moment on the subject can doubt that its discovery and employment in the shape of tools and engines has been of the utmost importance to man; and has done more, perhaps, than anything else to accelerate his advance in the career of improvement. Locke has the following striking observations on this subject: "Of what consequence the discovery of one natural body and its properties may be to human life, the whole great continent of America is a convincing instance: whose ignorance in useful arts, and want of the greatest part of the conveniences of life, in a country that abounds with all sorts of natural plenty, I think may be attributed to their ignorance of what was to be found in a very ordinary despicable stone—I mean the mineral of iron. And whatever we think of our parts or improvements in this part of the world, where knowledge and plenty seem to vie with each other, yet to any one that will seriously reflect upon it, I suppose it will appear past doubt, that, were the use of iron lost among us, we should in a few ages be unavoidably reduced to the wants and ignorance of the ancient savage Americans, whose natural endowments and provisions came no way short of those of the most flourishing and polite nations; so that he who first

made use of that one contemptible mineral, may be truly styled the father of arts and author of plenty."—*Essay on the Understanding*, book iv., c. 12.

Iron, on account of its abundance, working qualities, and tenacity, is probably the most useful and valuable of metals. According to Dr. Ure, "it is capable of being cast into molds of any form, of being drawn into wire of any desired length or fineness, of being extended into plates or sheets, of being bent in every direction, of being sharpened, or hardened, or softened at pleasure. Iron accommodates itself to all our wants and desires, and even to our caprices. It is equally serviceable to the arts, the sciences, to agriculture, and war. The same ore furnishes the sword, the plowshare, the scythe, the pruning-hook, the needle, the graver, the spring of a watch or of a carriage, the chisel, the chain, the anchor, the compass, the cannon, and the bomb." It is a medicine of much virtue, and the only metal friendly to the human frame." In its primitive position it is commingled with the earth's strata in bountiful profusion; it is found in various combinations and conditions in every formation, and it is a constituent element of both animals and vegetables.

History.—Malleable iron appears to have been known from a remote antiquity. Its obvious utility and great superiority over the softer metals, then commonly used, combined with the expense of its reduction, caused it to be highly prized, though the extreme difficulty of working it by the rude methods then employed, greatly restricted its application. There are notices in Homer and Hesiod of the arts of reducing and forging iron; but cast-iron was then unknown—an imperfectly malleable iron being produced at once from the ores in the furnace. It is probable that the Greeks obtained most of their iron through the Phœnicians from the shores of the Black Sea, and from Laconia. It would be interesting to trace the gradual advances which have been made in the reduction of iron, from its discovery to the present time; to inquire into the circumstances which led to the successive changes in the processes, and into the principle on which those changes were founded; to examine into the differences in the products which from time to time ensued, and to notice the influence of these conditions on the extent and progress of the manufacture. Our knowledge of these changes, however, is scanty and imperfect, and we can only conjecture what was probably its early progress. The furnaces which were first employed for smelting iron were probably similar to those now called *air-bloomeries*. They were probably simple conical structures, with small openings below for the admission of air, and a large one above for the escape of the products of combustion, and would be erected on high grounds in order that the wind might assist combustion. The fire being kindled, successive layers of ore and charcoal would be placed in it, and the heat regulated by opening or closing the apertures below.

The process of reduction would consist of the de-oxydation of the ore and the cementation of the metal by long continued heat. The temperature would never rise sufficiently high to fuse the ore, and the product would therefore be an imperfectly malleable iron, mixed with scoriæ and unreduced oxyd. It would then be brought under the hammer, and fashioned into a rude bloom, during which process it would be freed from the greater portion of the earthy impurities. By such a process as this the Romans probably worked the iron ores of our own island; scoriæ, the refuse of ancient bloomeries, occur in various localities, in some cases identified with that people by the coincident remains of altars dedicated to the god who presided over iron. Mungo Park saw a rude furnace of this kind used by the Africans, and, indeed, with some modifications, it is still retained in Spain, and along the coasts of the Mediterranean, where rich specular

ores are worked. The advantages of an artificial blast would soon become manifest, and a pair of bellows, or a cylinder and piston would soon be applied to the construction mentioned above. Homer represents Hephestus as throwing the materials from which the shield of Achilles was to be forged into a furnace urged by 20 pairs of bellows (*phœat*). The inhabitants of Madagascar smelt iron in much the same way, their blowing apparatus, however, consisting of hollow trunks of trees, with loosely-fitting pistons.

The furnace corresponds to the *blast-bloomery*, and has, by successive improvements, developed into the blast furnace, now almost universally used, and into the *Catalan forge*, still employed in some districts. The application of the blast would offer considerable advantages; it would obviate the necessity of an elevated site, place the temperature more immediately under the direction of the smelter, and render the whole process more regular and certain. The method of reduction remained the same as before, but the product would differ considerably, for whenever the blast was sufficiently powerful, the iron would be *fused*, a partial carburation would take place, and the resulting metal would be a species of steel, utterly useless to the workmen of those days; hence, it seems necessary to infer, that a rude process of refining was invented, the metal being again heated with charcoal, and the blast directed over its surface, the carbon would be burnt out, and the iron become tough and malleable. The processes might perhaps form two successive stages of one operation, as at present practiced with the Catalan forge.

The increasing demand for iron, and the progress of internal communication, would lead the smelter to increase the size and height of his bloomery, and this, probably, would lead to a very unexpected result. The greater length through which the ore had to descend, would prolong its contact with the charcoal, and a higher state of carburation would ensue, the product being cast-iron—a compound till then perhaps unknown.

From the time that cast-iron became the product of the smelting furnace, the refining would be made a separate process, requiring a separate furnace and machinery. It would soon be found also that, as the furnace increased in height, the pressure of the superincumbent mass would render the materials so dense as to retard the ascent of the blast, and thus cause it to become soft and inefficient; hence the internal buttresses called *boshes* were first introduced to support the weight of the charge, relieving the central parts from the pressure, and permitting the free ascent of the blast. While the good quality of the iron and the regularity of the process were thus insured, increase of quantity was the result of improvements in the blowing apparatus, which was now enlarged and worked by water-power. With these modifications, the furnace was the same essentially as the blast-furnace now employed, though not so large; indeed until the introduction of coke at a much later period, the blast-furnace seldom exceeded 15 feet in height by 6 at the widest diameter. The more perfect operation of the blast-furnace allowed the reduction of the heaps of scoriæ, which had been gradually accumulating during the period that the blast-bloomeries had been in operation, and which contained 30 to 40 per cent. of iron. A new species of property was thus created; extensive proprietorships of Danish and Roman cinders were formed; large deposits of scoriæ, which for ages had lain concealed beneath forests of decayed oak, were dug up, and in Dean Forest it is computed that 20 furnaces, for a period of upward of 300 years, were supplied chiefly with the bloomery cinders as a substitute for iron ore.

At what period the complete transformation of the blast-bloomery into the blast furnace was effected, it is impossible to say. It was probably in the early part

of the 16th century, as we find that in the 17th the art of casting had arrived at a considerable degree of perfection, and in the reign of Elizabeth there was a considerable export trade of cast-iron ordnance to the Continent. In the forest of Dean are the remains of two blast furnaces, which formerly belonged to the kings of England, but they have been out of blast since the commencement of the struggle between Charles I. and his Parliament. Calculating from the quantity of scoria accumulated in their immediate neighborhood, which appear to have lain undisturbed for the last two centuries, Mr. Mushet has attempted to deduce the period of their erection, which he conceives to have been about the year 1550, in the time of Edward VI. Up to this period wood charcoal was the only material employed in smelting operations, but the wants of a constantly increasing population, not less than the great consumption of the blast furnaces themselves, created a scarcity of this essential material, and gave a check to the manufacture. To such an extent had the wood been destroyed, that the cutting down of timber for the use of the iron-works was prohibited by special enactments; and the forests of Sussex alone appear to have been exempt from the general decree of conservation. The number of furnaces in blast decreased three fourths, and the annual production, which but a short time before is said to have been 180,000 tons, was in 1740 reduced to only 17,350 tons.

James I. granted patents to iron-masters in various parts of the kingdom for using pit-coal in the manufacture of iron. The obstacles to its introduction, however, were numerous, and not easily overcome. The comparatively incombustible nature of coke, and its feeble chemical affinities, rendered a more powerful blast and a longer subjection to the heat indispensable to its successful adoption. Ignorance of the causes of failure operated long and seriously, but all difficulties were at length surmounted. An enlargement of the height of the furnace prolonged the contact of the ore and coke, and at last the employment of the steam-engine and improved blowing apparatus rendered the blast much more powerful and regular, and gave that impetus to the manufacture which has caused Great Britain to take the first rank in this branch of industry.

The first great improvement in the blowing apparatus was the substitution of large cylinders, with closely fitting pistons, for the bellows. The earliest of any magnitude were probably those erected by Smeaton at the Carron Iron-Works, in 1760. In 1783-4, Mr. Cort, of Gosport, introduced the processes of puddling and rolling, two of the most important inventions connected with the production of iron since the employment of the blast furnace. (See Addenda, A.) About this time the steam-engine of James Watt came into use, and along with it commenced a new era in the history of the iron trade and every other branch of industry. Its immense power, economy, and convenience of application, brought it at once into general employment. It was soon applied to pumping, blowing, and rolling; it enabled the mines to be sunk to a greater depth; refractory ores to be reduced with facility, and the processes of rolling, forging, etc., to be effected with a rapidity previously unknown. Of late years Scotland has made considerable progress in the iron manufacture. The introduction of railway communication, and the invention of the hot-blast, have given a stimulus to the trade which has raised Glasgow into importance as an iron district, and few towns possess greater facilities for the sale of their produce, than this central dépôt of the mineral treasures of the country by which it is surrounded.

The hot-blast process, for which a patent was taken out by Mr. Nelson in 1824, has effected an entire revolution in the iron industry of Great Britain, and

forms the last era in the history of this material. This simple but effective invention has given such facilities for the reduction of refractory ores, that between three and four times the quantity of iron can be produced weekly, with an expenditure of little more than one third the fuel; and, moreover, the coal does not require to be coked, or the ores to be calcined. In conclusion, we may add that there appear to have been five distinct epochs in the history of the iron trade.

The *first* dating from the employment of an artificial blast to accelerate combustion. The *second* marked by the employment of coke for reduction, about the year 1750. The *third* dating from the introduction of the steam-engine, and on account of the facilities which that invention has given for raising the ores, pumping the mines, supplying the furnace with a copious and regular blast, and moving the powerful forge and rolling machinery, we may safely attribute this era to the genius of James Watt. The *fourth* epoch is indicated by the introduction of the system of puddling and rolling, very soon after the employment of the steam-engine. The *fifth*, and last—though not the least important epoch in the history of this manufacture—is marked by the application of the hot-blast—an invention which has increased the production of iron fourfold, and has enabled the iron-master to smelt otherwise useless and unreducible ores; it has abolished the processes of coking and roasting, and has given facilities for a large and rapid production, far beyond the most sanguine anticipations of its inventor. Manufacturers taking advantage of so powerful an agent, have not hesitated to reduce improper materials, such as cinder-heaps and impure ores, and by unduly hastening the process, and attending to quantity more than to quality, have produced an inferior description of iron, that has brought the invention into unmerited obloquy.

The Ores.—The ores of iron are found in profuse abundance in every latitude, embedded in or stratified with every formation. They occur both crystallized, massive, and arenaceous, lying deep in strata of vast extent, filling veins and faults in other rocks, and scattered over the surface of the ground. Sometimes, but rarely, found native; usually as oxyds, sulphurets, or carbonates, more or less mingled with other substances. Of these ores there are perhaps twenty varieties, many of which are, however, rare; others are combined with substances which unfit them for the manufacture of iron, so that the remainder may be classed under the following general heads; their composition, however, varies greatly:

1. The magnetic oxyds, in which the iron occurs, as Fe_3O_4 or $\text{Fe}_2\text{O}_3 + \text{Fe O}$. This is the purest ore which is worked: the best Swedish metal is manufactured from it. It is found in primitive rocks, and is widely diffused over the globe.
2. Specular iron ore, peroxyd of iron, Fe_2O_3 . This is rich and valuable, and has been worked from a remote antiquity in Elba and Spain. It is found chiefly in primary and transition rocks.
3. Red and brown hæmatites, hydrated peroxyd of iron. These ores occur in botryoidal radiating masses, in Cumberland, Ireland, America, and other places.
4. Carbonate of iron. This ore occurs mixed with large quantities of argillaceous, carbonaceous, and silicious substances, forming the large deposits of clay-iron-stone and blackbands, from which most of the iron of this country is obtained. These strata are generally found in close proximity to the coal measures. All the above ores are more or less mixed with silica, alumina, oxyd of manganese, etc., and it may not be uninteresting to glance at their geographical distribution in Europe and America.

The United Kingdom.—Great Britain possesses peculiar and remarkable advantages for the manufacture of iron. The ores are found in exhaustless abundance, usually interstratified with the coal for their reduction, and in close proximity to the mountain limestone,

which is used as a flux. In few countries do these three essential materials occur in such abundance, or so near together as to give the necessary facilities for a large and profitable production. The ores principally employed are the clay-ironstones and carbonates of blackbands, which are found interstratified with the coal fields of Ayrshire, Lanarkshire, Shropshire, South Wales, and other parts, and these vary in richness in different localities, according to position and the amount of silica, clay and other foreign matter with which they are associated. The chemical composition of three varieties of the ore used in Lanarkshire is given by Colquhoun, as follows:

	No. 1.	No. 2.	No. 3.
Protoxyd of iron....	53.08	47.33	35.22
Carbonic acid.....	35.17	33.10	32.53
Silica.....	1.40	6.63	9.56
Alumina.....	0.63	4.80	5.34
Lime.....	3.33	2.00	8.62
Magnesia.....	1.77	2.20	5.19
Peroxyd of iron.....	0.23	0.33	1.16
Bituminous matter..	3.03	1.70	2.13
Sulphur.....	0.00	0.22	0.62
Oxyd of manganese..	0.00	0.13	0.00
Moisture and loss....	1.41	2.26	0.00
Total.....	100.00	100.00	100.37

The carbonic acid in the above ores may be partly combined with the lime as carbonate of lime, as well as with the protoxyd of iron. M. Berthier gives, according to Dr. Ure, the following analysis of the English and Welsh ironstones of the coal measures:

	Rich Welsh Ore.	Poor Welsh Ore.	Dudley Rich Ore or Gubbin.
Loss by ignition....	30.00	27.00	31.00
Insoluble residuum..	8.40	22.03	7.66
Peroxyd of iron.....	60.90	42.66	53.33
Lime.....	0.00	6.00	2.66
Total.....	98.40	97.69	99.65

Calculating the amount of carbonate of iron and metallic iron indicated by the above analyses, we have:

Carbonate of iron...	88.77	65.09	85.20
Metallic iron.....	42.15	31.38	40.45

The richness of the above ironstones would be about 33 per cent. of iron. In the process of roasting, 28 per cent. of the ore is dissipated. Mr. Mitchel gives also the following assays of clay-ironstone and blackband ore, as under:

	Clay Ironstone, Leitrim, Ireland.	Blackband Carbonate Ore.
Protoxyd of iron.....	51.633	20.924
Peroxyd of iron.....	3.742	.741
Oxyd of manganese.....	.976	1.742
Alumina.....	1.849	14.974
Magnesia.....	.234	.987
Lime.....	.410	.881
Potash.....	.274	Trace.
Soda.....	.372	Trace.
Sulphur.....	.214	.098
Phosphoric acid.....	.284	.114
Carbonic acid.....	31.142	14.000
Silica.....	6.640	26.179
Carbonaceous matter.....	2.160	16.940
Loss.....		2.420
Total.....	100.000	100.000

In North Lancashire and Cumberland, the red hematite ores are now extensively worked, and great quantities are yearly shipped from Whitehaven, Ulverstone, etc., to Staffordshire, South Wales, and Scotland, for mixing with the poorer argillaceous and blackband ores. In Cumberland, North Lancashire, no less than 546,998 tons were raised in 1854 for this purpose, and the greater portion was exported from those districts. In addition to these exports, about 25,000 to 30,000 tons are smelted by the hot blast at Cleator, in the neighborhood of Whitehaven. It produces a strong and ductile iron, considered highly

valuable for mixing with the weaker irons. These ores have been carefully analyzed, and contain:

Peroxyd of iron.....	90.3
Silica.....	5.0
Alumina.....	3.0
Lime.....	trace.
Magnesia.....	trace.
Water.....	6.0

Total..... 104.3

Or about 62 per cent. of metallic iron.

The following table gives the state of the trade in 1856; the particulars are extracted from the Mining Records, published under the direction of Mr. R. Hunt, in connection with the Museum of Practical Geology, London. The importance which Scotland has assumed in reference to the iron manufacture is especially worthy of notice:

Counties.	No. of Works.	No. of furnaces erected.	No. of furnaces in blast.	Total produce in tons.
ENGLAND:				
Northumberland, Durham, and Yorkshire....	37	106	80	348,444
Derbyshire.....	13	33	25	127,500
Lancashire & Cumberland	2	5	8	20,000
Staffordshire.....	72	203	166	847,600
Shropshire.....	13	34	23	124,800
Gloucestershire.....	4	7	5	21,990
WALES:				
Flintshire, Denbighshire, Glamorganshire.	7	11	9	32,900
Anthracite district.	14	35	21	750,000
Glamorganshire and Monmouthshire.	84	134	100	
Bituminous district.				
SCOTLAND:				
Ayrshire.....	5	41	30	249,600
Lanarkshire.....	13	83	72	463,000
Other counties.....	10	27	16	79,040
Total.....	228	724	555	3,069,574

In connection with the above, we insert the following table from Mr. Kenyon Blackwell's paper on the Iron Industry of Great Britain, read before the Society of Arts. It gives the estimated production of crude iron in the various countries:

	Tons.		Tons.
Great Britain.....	8,000,000	Sweden.....	150,000
France.....	750,000	Various German States.....	100,000
United States.....	750,000	Other countries....	300,000
Prussia.....	300,000		
Austria.....	250,000		
Belgium.....	200,000	Total.....	6,000,000
Russia.....	200,000		

In referring to the above, it will be seen that Great Britain produces as much crude iron as all other countries put together; and a great portion of that iron being converted into bars and plates, indicates a large and important article of production. An article of immense value to the country—of great demand at home and abroad—and justly entitled not only to improvements and economy in its manufacture, but to the generous support of a liberal and an enlightened government.

Previously to 1845, the imports of foreign iron into Great Britain usually varied from 20,000 to 25,000 tons a year. But at that epoch the duties on foreign iron (20s. a ton on iron in bars) were repealed; and there has since been an increase in the imports of Swedish bar-iron, which is especially well fitted for being made into steel. The imports of all sorts of foreign iron amounted, in 1849, to 29,396 tons, whereof 25,039 tons were from Sweden.

Perhaps in nothing has the fall of price, consequent on the diminution of the cost of production, that has taken place since the peace of 1815, been more conspicuous than in hardware. At an average, articles of hardware are at present (1857) full 50 per cent. lower than in 1820. And it may be safely affirmed that there are very few descriptions of articles to which a fall of price would have been so advantageous.

ACCOUNT OF THE DIFFERENT DESCRIPTIONS OF IRON (INCLUDING UNWROUGHT STEEL) EXPORTED FROM THE UNITED KINGDOM DURING 1850, SPECIFYING THE QUANTITIES SENT TO THE DIFFERENT COUNTRIES.*

Countries to which exported.	Pig iron.	Bar iron.	Bolt and rod iron.	Cast iron.	Iron wire.	Wrought iron, viz.				Old iron for re-manufacture.	Un-wrought steel.
						Anchor grapnels, etc.	Hoop.	Nails.	Of all other sorts (except ordnance).

* Cwts. and lbs. are omitted in this table, but are allowed for in the summing up.

In Ireland there are vast deposits of iron ore of great richness, though as yet but little worked. Some of these, such as the ores worked at the Arigna mines, and the Kidney ores of Balcary Bay, yield as much as 70 per cent. of iron. If these mines were worked more extensively, and if peat fuel were used in the smelting operations, the iron would probably be of the very best quality, and might rival the famed Swedish charcoal metal. Of this there is now every reason to hope, as the establishment of railway communication, with almost every part of Ireland, will open out the immense peat bogs of that country, and facilitate the introduction of vegetable fuel for the reduction of the ores, and create a large and important addition to other branches of Irish industry.

France possesses an abundant supply of iron ore, but on account of the scarcity of coal, the manufacture has been greatly restricted in extent. The introduction of railway communication is, however, rapidly removing this difficulty, and the operations of smelting are greatly on the increase. The railroad has enabled the French iron-master to substitute coal for charcoal in the reduction of the iron ores, and in consequence an immense increase has taken place in the

production of pig and manufactured iron. The ores are found in beds or strata in the Jura range; accumulated in kidney-shaped concretions in the fissures of the limestone; or dispersed over the surface of the ground, and but slightly covered with sand or clay. They are found in the Departments of the Yonne, the Meuse, and the Moselle, and indeed may be traced from the Pas de Calais on the north to the Jura on the south, indicating throughout an abundant and ample supply. The present increased production of iron in France is chiefly due to the introduction of coal in smelting, but it may also be traced in some measure to the encouragement given by the government to that branch of industry, and to the enterprise of such men as M. de Gallois and M. Dufrénoy, who have exerted themselves to extend its manufacture in that country. M. de Gallois resided in England for several years, immediately subsequent to the peace of 1815, and having obtained admission into the different iron-works here, he returned to France and established the works at St. Etienne, now probably the largest and most extensive in that country. The universal exhibition of last year (1855) fully justifies the remarks in reference to the great increase of the iron

trade of France. Any person in the least conversant with the imperfect machinery and processes of the iron manufacture as it existed in France some years since, could not have been otherwise than struck with the improved character of those exemplified in the Paris Exhibition. In no country (probably not excepting even this) has so great progress been made in so short a time, in advancing from a state of comparative rudeness to one of considerable perfection, as in France. The production of crude pig-iron in France is now little short of 1,000,000 tons annually, but the demand for railways, rolling-stock, bridges, iron ships, girders, and other constructions is so great that large quantities of iron are still annually imported from this country.

German Iron Manufactures.—The increase in the production and manufacture of iron in Germany, within the last few years, is remarkable. In Prussian Westphalia alone, no less than 16 mining and smelting companies have been formed since 1848—12 of them since 1854. In 1853, this province produced but 603,525 cwt. pig iron, and 118,064 cwt. cast iron ware; while in 1854 the product was 709,110 cwt. pig iron, and 332,061 cast iron ware; showing an increase of 73 per cent. in one year. In 1855 the same province produced 1,513,039 cwt. pig iron, and 1,126,025 cwt. bar iron. The product of iron ore in all Prussia in 1853, was 1,496,516 tons; and in 1854, 2,144,149 tons; increase, 647,633 tons. The product of all the furnaces in the kingdom of Saxony, in 1852, was 168,175 cwt.; in 1853, 170,637 cwt. Bavaria produced in 1850, 668,167 cwt.; in 1853, 1,074,317 cwt. Austria, in 1830, produced 1,437,836 cwt. pig iron, and 151,637 cwt. cast iron ware in 1854, 4,151,505 cwt. pig iron, and 582,446 cwt. cast iron ware. The product of all the furnaces in the States of the Zollverein was: In 1851, 4,612,102 cwt.; in 1852, 5,137,821 cwt.; in 1853, 6,126,458 cwt.; in 1854, 7,501,470 cwt.; showing an increase from 1851 to 1854, of 64 per cent. At this rate of increase, the production of iron will soon exceed its consumption in Germany. But little railroad iron is now imported into Germany. The rolling-mills on the lower Rhine, in Berlin, and in Silesia, supply Prussia; the rolling-mill of Zwickau meets the demand of Saxony, and that of Burglengenfeld supplies Bavaria. Austria, too, is supplied by domestic mills. German rails are more expensive than English, but are also said to be more durable.

In regard to machinery, Germany is also making rapid progress, and already outstrips England in the building of locomotives. Not a single locomotive is now sent from England to Germany on German account, while numbers of them are sent from Germany to France and Switzerland. Extensive iron-foundries and machine-shops are to be found in Berlin, Vienna, Munich, Augsburg, Esslingen, Karlsruhe, Aix-la-Chapelle, Ruhrort, Hanover, etc. Up to January 1, 1854, one establishment in Berlin had alone turned out 500 locomotives, and 1300 have been built in all in Germany since 1841. German cutlery is likewise beginning to compete with the English, especially in the West India and South American markets. The sugar plantations of the West Indies, which formerly obtained their harvesting implements from England, now import them direct from Germany.

Prussia.—Valuable deposits of the blackband and clay carbonate ores are found interstratified with the great coal-field of Ruhr; and the bog-iron and hæmatite ores are found in considerable profusion in Rhenish Prussia and other parts. In Upper Silesia, on the Vistula and the Oder, large deposits of coal and iron are found in juxtaposition, and are worked to a considerable extent.

The consumption of iron is not so great as in France, though it is increasing rapidly, as may be seen from returns recently given by the British Chargé d'Affaires at Berlin. These returns show that the amount

of iron ore raised in Prussia has increased from 1,495,516 tons in 1853, to 2,144,509 tons in 1854; this has taken place in nearly all the producing districts, but chiefly on the Rhine, where the demand has increased from 719,684 to 1,068,656 tons; in Westphalia, from 146,320 to 330,014 tons; in Silesia, from 563,739 to 650,369 tons; in lower Saxony and Thuringia, from 51,963 to 70,676 tons; in Prussian Brandenburg, from 8,084 to 12,731 tons; and in the Upper Zollverein from 6,736 to 12,063 tons.

In Austria, all the iron is smelted with charcoal or carbonized peat, and is, in consequence, of the finest quality; it may be applied to every description of manufacture, from the most ductile wire to the hardest steel. The production is, however, small. The ores are found in Hungary, Styria, Moravia, and Upper Silesia.

In Belgium, both coal and iron are found in equal abundance, and are worked at Charleroi, Liege, and at other places. The ores, which are chiefly hæmatite, are derived from the limestone at the base of the coal measures.

The superiority of the Swedish iron has long been acknowledged, and till recently it has been unrivaled. This arises not only from the purity of the ore—the magnetic oxyd of iron—but in consequence of its being smelted with charcoal only. The quantity is, however, restricted, as the iron-masters are allowed by law only a certain number of trees per annum, in order that the forests may not be totally destroyed. Coal does not exist in either Sweden or Norway.

In 1844 some experimental researches were undertaken by Mr. Fairbairn of Manchester, at the request of the Sublime Porte, in regard to the properties of iron made from the ores of Samakoff in Turkey. The ores were strongly magnetic, and contained, according to Dumas and others, 62 to 64 per cent. of iron. They consisted of:

One atom iron	28	+ one atom oxygen	8	= 36
Two atoms iron	56	+ three atoms oxygen	24	= 80
Iron....	84	Oxygen.....	82	116

Some of these ores have been smelted with charcoal, and some very fine specimens of iron and steel produced. The manufacture is, however, in a languid state in Turkey, and although smelting furnaces, blowing apparatus, forges, rolling mills, etc., were prepared and sent out from this country, they are to a great extent useless among a people who have deeply rooted prejudices and habitual inactivity to overcome, and every thing to learn in all those habits of industry which indicate the rising prosperity of an energetic and an active people.

America.—Both the magnetic, hæmatite, and clay-ironstones abound in the United States. The magnetic ores worked in New England, New York, and New Jersey; the hæmatite in Pennsylvania, New York, New Jersey, and other localities; but the greater part of the manufacture must eventually establish itself in the valley of the Mississippi, west of the Alleghany range, where vast deposits of coal and iron exist, though at present but imperfectly known or developed. The ores in most of these districts are smelted with a mixture of charcoal and anthracite, and the usual limestone flux, and produce a very excellent quality of iron. In another portion of this article (see p. 1105) a full account of the iron ores of the United States is given.

In Nova Scotia some of the richest ores yet discovered occur in exhaustless abundance. The iron manufactured from them is of the very best quality, and is equal to the finest Swedish metal. The specular ore of the Acadian mines, Nova Scotia, is said by Dr. Ure to be a nearly pure peroxyd of iron, containing 99 per cent. of the peroxyd, and about 70 per cent. of iron. When smelted, 100 parts yield 75 of iron, the increase in weight being due to combined carbon. The red

ore Dr. Ure states to be analogous to the kidney ore of Cumberland, and to contain :

Peroxyd of iron.....	85.8	84.4
Silica.....	8.2	8.0
Water.....	6.0	7.6
	100.0	100.0

The Acadian ores are situated in the neighborhood of large tracts of forests, capable of supplying almost any quantity of charcoal for the manufacture of the superior qualities of iron and steel. Several specimens of iron from these mines have been submitted to direct experiment, and the results prove its high powers of resistance to strain, ductility, and adaptation to all those processes by which the finest description of wire and steel are manufactured. The difficulties which the government have had to encounter, during the last two years, in obtaining a sufficiently strong metal for artillery, are likely to be removed by the use of the Acadian pig-iron. Large quantities have been purchased by the War Office, and experiments are now in progress, under the direction of Lieutenant-Colonel Wilmot, Inspector of Artillery, and of Mr. Fairbairn, which seem calculated to establish the superiority of this metal for casting every description of heavy ordnance. There are also some very rich ores at the Nictau mines, as the following analyses by Dr. Jackson show. They contain impressions of Silurian tentaculites, spirifers, etc. :

	Brown Ore, somewhat magnetic.	Red Iron Ore.
Peroxyd of iron.....	70.20	64.40
Silica.....	14.40	19.20
Carbonate of lime.....	5.60	5.40
Carbonate of magnesia.....	2.80	3.20
Alumina.....	6.80	1.20
Oxyd of manganese.....	.40	4.40
Water.....	.00	2.40
	100.20	100.20
* Gain from oxygen.	-20*	-20†
† Over-run, probably carbonic acid from carbonate of lime.	100.00	100.00

As our limits are circumscribed, it will not be necessary to extend this section further; suffice it therefore to observe, that in all countries nature has, with a beneficent purpose, interlaid and interstratified the whole surface of the globe with this useful and indispensable material, and it would ill bespeak that high intelligence with which man is endowed if he did not avail himself of, and turn to good account, the immense stores of mineral treasures which are so profusely laid at his feet.

Fuel.—The inquiry into the properties and composition of the ores of iron, and the processes employed for their reduction and subsequent conversion into bars and plates, would be incomplete unless accompanied by descriptive analyses of the fuel by which they are fused. Indeed the results of the operations of smelting, puddling, etc., are so intimately dependent on the quality of the fuel employed, as to render a knowledge of its constituents essential to the manufacture of good iron.

Charcoal was at first universally employed in the manufacture of iron, and on account of its purity compared with other kinds of fuel, and its strong chemical affinities and consequent high combustibility, it is of very superior value where it can be obtained in large quantities at a moderate cost. This, however, is rarely the case, and hence its use is restricted within very narrow limits in most countries. Charcoal is the result of several processes, in each of which the object is to increase the amount of fuel in a given bulk. The wood being cut into convenient lengths, and piled closely together, in a large heap, the interstices being filled with the smaller branches, and the whole covered with wet charcoal powder, is then set on fire. Care is taken that only sufficient air is admitted to consume the gaseous products of the wood, so as to maintain the high temperature without needlessly con-

suming the carbon. After the whole of the gaseous products have been separated, and the carbon and salts only are left, the access of air is prevented, and the heap allowed to cool.

Another and better process is to throw the wood into a large close oven or furnace, heated either by the combustion within it, or by a separate fire conducted in flues around it. By this process, not only is the yield greater and of better quality, from the slower progress of the operation, but the products of the distillation may be preserved and employed for a great variety of purposes. The following results of some experiments by Karsten, show the difference in yield of very rapid and very slow processes :

Wood.	Charcoal produced by quick carbonization.	Charcoal produced by slow carbonization.
Young oak.....	16.54	25.60
Old oak.....	15.91	25.71
Young deal.....	14.25	25.25
Old deal.....	14.05	25.00
Young fir.....	16.22	27.72
Old fir.....	15.35	24.75
Mean.....	15.38	25.67

These, on the average, give for the quick processes 15.3, and for the slow 25.6, being in the ratio of 1 : 1.67, or 0.67 in favor of the quick process.

Peat.—This material seems likely to come into use for smelting iron in countries such as Ireland, where neither coal nor wood are found in abundance. It is purer and less objectionable than coal, and if properly dried, compressed, and carbonized, would prove a very valuable fuel for the reduction of such ores as we have already described in the section on the iron ores of Ireland. It is carbonized in the same way as the charring of wood.

Coke.—Before the introduction of the hot-blast, this material was used to a very great extent in the manufacture of iron; it is prepared from coal in the same way that charcoal is prepared from wood, the operation being called the coking or desulphurizing process. The heaps do not require so careful a regulation of the admission of air as those of charcoal, on account of the comparatively incombustible character of the coke. Sometimes the heaps are made large, with perforated brick chimnies, to increase the draught through the mounds; at other times they are formed into smaller heaps, and the conversion takes place without the intervention of flues. The more usual and economical plan is, however, the employment of close ovens, by which process a great saving is effected, the yield being from 80 to 50 per cent. in the one case, and from 50 to 75 in the other, according to the nature and quality of the coal.

The following table of the heating power of various kinds of fuel, from Knapp's Chemical Technology, is not without interest; in practice, however, only a portion of the absolute heating power is made available :

Fuel.	Authority.	Pounds of water heated from 0° to 100° centigr. by 1 lb. of fuel.

Coal.—The hot-blast has enabled the iron-masters to use raw coal in the blast furnaces, the great heat of

the ascending current of the products of combustion coking it as it falls in the furnace. The sulphur however, and other deleterious ingredients, do not appear to be so completely got rid of as when the coal is used in the shape of coke; and it appears probable, that even with the hot-blast, the separate process of coking

might be advantageously used, on account of the greater purity of the iron produced.

The following tables, selected from various sources, give the composition of the different kinds of fuel, all of which are applicable to the reduction and fusion of the iron ores:

Fuel.	Locality.	Specific gravity.	Carbon.	Hydrogen.	Oxygen and Nitrogen.	Ashes in 100 parts.	Authority.
Splint Coal.	1.290	75.00	6.25	18.75	Thomson.

"	Kilbakan.	51.13	6.33	34.48	8.06	

According to Knapp, peat contains from 1 to 33 per cent. of its weight of ash. In coal we have the following from Mr. Mushet's analyses:

	Specific gravity.	Carbon.	Ashes.	Volatile matter.
Welsh furnace coal.	1.337	88.068	3.432	8.300
" " "	1.393	89.709	2.300	8.000
" slaty "	1.409	82.175	6.725	9.100
Derbyshire furnace coal	1.264	82.882	4.238	42.830
" cannel "	1.278	48.362	4.638	47.000

And again the analyses, from Overman, of the ash of coal, may be quoted, as showing the constituents contained in the ashes derived from combustion:

Sulphate of lime.	80.3	3.6
Lime.	8.8	2.5
Silice.	14.2	85.7
Oxyd of iron.	1.7	0.0

Malleable Iron.—The greatly extended application of wrought iron to every variety of construction renders an investigation of its properties peculiarly interesting. It is now employed more extensively than cast iron; and on account of its ductility and strength nearly two thirds of the weight of material may in many cases be saved by its employment, while great lightness and durability are secured. Its superiority is especially evident in constructions where great stiffness is not required, but on the other hand any degree of rigidity may be obtained by the employment of a tubular or cellular structure, and this may be seen in the construction of wrought iron tubular bridges, beams, and iron shops. The material of malleable iron which is making such vast changes in the forms of construction, can not but be interesting and important, and considering that the present is far from the limit of its application, we shall endeavor to give it that degree of attention which the importance of the subject demands. From the forge and the rolling-mill we derive two distinct qualities of iron, known as "*red-short*" and "*cold-short*." The former is the most ductile, and is a tough, fibrous material, which exhibits considerable strength when cold; the latter is more brittle, and has a highly crystalline fracture almost like cast-iron; but the fact is probably not generally known, that the brittle works as well, and is as ductile

under the hammer, as the other, when at a high temperature.

United States.—Iron was first made in America in the province of Virginia, about the year 1715, and the example was quickly followed by the provinces of Maryland and Pennsylvania. This opening of a new source of wealth was a subject of great satisfaction and importance to those who were interested in the prosperity of the colonies, presenting to their view, at no distant date, a prospect of independence of foreign countries for the supplies of those most essential articles, iron and timber.

No further returns were published.

In 1810, Mr. Gallatin, the Secretary of the Treasury of the United States, presented to Congress a report on the manufactures, in which, among many other branches, iron, and the manufactures of iron, are mentioned as being firmly established, supplying, in several instances, the greater, and in all, a considerable portion of the consumption of the United States.

"The furnaces, forges, and bloomeries of the United States, amount to 530, of which the State of New York furnishes 69. The annual value of iron and its manufactures is estimated at \$12,000,000 or \$15,000,000. The average value of imported metal, in bar-iron and steel, at \$4,000,000. The Franconia Iron Works, in New Hampshire, established in 1810, employ a capital of \$100,000. The Vergennes Iron Works, in Vermont, promise to be very important. The price of bar-iron at this establishment is \$140 per ton; the ore \$3, charcoal \$4.50 per 100 bushels; 19,000 muskets are annually made at the two public armories of Springfield and Harper's Ferry. There is now a considerable surplus of small arms."

Some of the ores of iron are found in every State in the Union; and, about the period of Mr. Gallatin's report, mines of this metal were worked in New Hampshire, Vermont, Rhode Island, New York, Connecticut,

cut, New Jersey, Pennsylvania, Virginia, and North Carolina.

According to the "Statistical Annals of the United States," by Adam Seybert, founded on official documents, the manufacture of iron in the year 1810 was as follows: 153 furnaces, making 53,908 tons of iron; 330 forges, making 24,541 tons of bar-iron; 316 trip-hammers; 84 rolling and slitting-mills, which required 6500 tons of iron; 410 naileries, in which 15,727,914 lbs. of nails had been made. Manufacture of iron, value, \$14,364,526.

From abstracts of reliable statements it appears that the whole quantity of iron made in the year 1830, computed in pig-iron, amounted to 191,536 tons, produced from 239 furnaces, two fifths of which were made in Pennsylvania.

The average quantity of hammered iron imported from 1821 to 1830, was about 26,200 tons, and of rolled iron about 5600 tons, making together 31,800 tons, valued at \$1,762,000. The whole quantity of hammered and rolled iron consumed in the United States in 1830, may be estimated at about 144,666 tons.

The value of the various foreign manufactures of iron consumed, on an average, from 1821 to 1830, was about \$4,000,000, making the whole amount of foreign iron and its manufactures annually consumed, about \$5,762,000.

It is not easy to strike the true medium, the best policy, between the proper fostering care by protection, due to the iron manufacturer, and, at the same time, not to restrict the construction of railroads, and, as a consequence, the growth of new States, by confining by high duties the supply of iron to the production of our own mills. The reduction of duty on iron, by the new tariff, from 30 to 24 per cent., will, undoubtedly, have some effect on our iron manufactures; but rather to limit the profits, than to reduce the production or number of mills; the present prices are ample to give large profits to home manufacture,

even if a small decline follows the reduction of duty. The iron manufacture of the United States is only a question of time, and no very great amount of that cash article is now required to bring it to that point where it will take the lead of the world, and become the staple and most profitable branch of American industry. A great deal of instruction is to be derived from the reports of the iron manufacture in England. The following is an extract from one of the most recent:

"Thanks for the most part to the demand from the United States, the iron trade of south Staffordshire

may be reported as much more healthy than it was a month ago. By the last two or three American mills there have been brought specifications which, in their number and value, form a striking contrast to those received during many months past. These show that the American mills are able to supply only a very small portion of the demand of the States; and are demonstrative that with bars at £8 instead of £9, a trade might be carried on with America to an extent that would be restricted by nothing else than the powers of production attaching to the British works. The *Persia*, whose letters were delivered on Saturday last, was especially valuable in respect of such specifications. In the past fortnight, however, the 'make' of south Staffordshire has not been by any means so large as under such circumstances might have been expected. This has been occasioned by the unusual circumstances of large masses of machinery at several works having been stopped by breakages, which have all happened within a few days of each other. By the end of this week the preparations that have ensued will be completed, and if there should not be a recurrence, the next fortnight will be characterized by the utmost animation at the works of the principal iron-masters of the district. The large American demand will make the inconvenience greater than is now being felt by most of the makers of malleable iron, from the exceedingly short supply of hematite ore of sample sufficiently fine for the purposes of the puddling furnace. If this deficiency should last much longer, it will cause some little anxiety in cases where those descriptions of iron are in demand, in the manufacture of which pounded calcined cinder is not an efficient substitute. There are no complaints of a shortness of supply of those coarser samples of red ore used in the blast furnace."—*London Engineer*, Feb.

The supply of the best quality of iron is decreasing in England, whereas in this country we are but beginning to develop and become acquainted with our best ores. "Iron Mountain" and "Pilot Knob" in Missouri, contain iron in immense quantities, and of a purity of ore not to be found but in two or three mines, and limited in amount, in Sweden. And Kentucky has undeveloped iron ores to a great extent, and of uncommon purity. We ought to export rather than import iron; and in less than twenty years we shall do so, unless some wonderful mineralogical discoveries are made in the British Isles.

No State in the Union is so vitally interested in the iron trade as Pennsylvania. Iron, in all its different varieties, forms one of the chief sources of State wealth. The ore abounds in several sections of this commonwealth, while furnaces dot the hill-sides and valleys, giving employment to numerous laborers, and producing thousands of tons of iron, which are transported to other States, and serve to enrich all who are interested in its manufacture. Each year science applies iron to more of the common uses of every-day life. It supplies the material for ships; enters largely into the construction of houses; forms part of all the new and improved agricultural implements; and thus becomes a rival to timber in the mechanical department of our country. This increasing consumption, of course, must increase the demand in a parallel degree, and if Congress will but legislate wisely, and in favor of home labor and capital, as exhibited in the iron trade, it must prosper in the future. It is surely the policy of our country to foster this branch of her productive industry. It is by wise, judicious legislation, that comparatively young countries are enabled to compete with older and more practiced ones, where capital is abundant and labor cheap. This is the kind of legislation demanded by the iron trade of this State and country, and we hope that such will be extended by our national legislature.

Since the commencement of the present year, the iron market of this country has been marked by pecu-

liar circumstances. East of the Alleghany mountains the production of pig iron exceeds the quantity manufactured during the same period of any previous season. A still greater increase is also looked for during the remaining months. There is now on hand a considerable quantity of the stock of 1855, accumulated in consequence of the severity of the winter preventing iron from being delivered when ordered. But a singular fact is, that with all these apparent drawbacks, the price steadily and firmly advanced to the highest quotation, and sales have been greater in the early months of this, than in the same months of any other year. More than 60,000 tons were contracted for in this city, in the month of April, to be delivered during the year. This is a very heavy business to be perfected so early in the season, and since then the quantity has been swelled to a much higher figure. Importations of pig iron, especially Scotch, have been decreasing for the past year or 18 months. During the six months ending December 31st, 1855, the importation of pig iron from all foreign ports only reached 29,839 tons. This is less than one third of the amount imported during the previous 12 months. This is a cheering indication, and the decrease in the importation of foreign pig iron will give a fresh impetus to our home manufacture, which is much needed in many sections of the Union.

The long and severe winter prevented shipments of bar iron from Pittsburg in the usual quantities, consequently there has been a heavy accumulation of that particular stock at that place. It was estimated that in the month of April, there were 35,000 tons of bar iron waiting sale and transportation at Pittsburg. In despite of these facts, however, the various mills are in full operation, depending upon the heavy trade to carry them through the season. The general prosperity of all the western interests must keep up the demand for iron, and if so the stock will not be too heavy. It is computed that 280,000 tons of pig iron will be produced in the West during the present year—this, of course, includes western Pennsylvania. From the districts of Alleghany, Hanging Rock, and Clarksville, about 200,000 tons will be sent to market. There will be a decrease of charcoal pig iron in the present year, when compared with the production of 1855, of 55,000 tons. The product of new coke and raw bituminous coal furnaces will, however, make good at least 15,000 tons of this deficit. The amount of anthracite pig iron consumed in the West in 1855, was 33,000 tons. There will be an increased amount needed during the present year, if we may judge from the contracts made for supplies from Susquehanna. We give below an interesting article from the "Iron Masters' Review," showing the amount of pig iron consumed in the places named in the West; and also the quantity and value of railroad iron imported into the United States, from the 30th June, 1839, to the 30th June, 1855. It is well worthy an attentive perusal by all those who are interested in the iron trade of the United States.

In the lower part of the Susquehanna district, the furnaces have mostly produced for the western market. There has been considerable irregularity in their operations, partly on account of deficiency of coal and the late opening of navigation. The new furnaces—Dudley, Keystone, No. 2 Cornwall—and several furnaces which worked little, if any, in 1855, will probably increase the product of the district this year by 25,000 tons. Circumstances do not admit of a comprehensive survey of the product of this district, nor of the demands that may come from the West.

In the Lehigh district, at this date, the stock of pig iron, which is nearly all No. 1, amounts to 34,150 tons. The contracts already made, for iron of this district, for this year's delivery, approximate to 37,600 tons. There are 17 furnaces now in blast, one to be put in blast by the middle of May, and one in July

The 17 furnaces are producing weekly an average of 2100 tons, making for the remaining 37½ weeks of 1856, 78,750 tons, which, added to the present stock, gives an aggregate of 112,900 tons. In this estimate we omit the product of the two furnaces soon going into blast, to make up for the possible deficiencies that may result from accidents. If we allow for next year's market the production in four weeks of December, during which the product may be closed in by winter, we have 104,500 tons for the market for this year, less than already contracted, 87,600 tons; leaving unsold for this year's delivery 66,900 tons. In these estimates no account is taken of the small sales in the district, nor of a few small shipments by railroad, made in 1856 prior to this date. The sales of iron from this district in 1856, approximated to 105,000 tons—equal to a reduction of stocks, of 19,000 tons. The stocks on the 1st of January last approximated to 20,700 tons, and on the 1st of January, 1855, to 39,000. The total production in this district in the year 1856, will approximate to 106,000 tons; assuming as a basis the data above given, which will prove reliable, save as it may be affected by accidents in manufacturing, or by a change in the market. The production in the 14 weeks past has not averaged 2100 tons—several furnaces having but recently been put in blast.

The consumption of rails within the past nine months has greatly increased over the average of the previous year. The importation in the six months ending December 31, 1855, amounted to 89,854 tons; or 50 per cent. more than in the average of the previous 12 months. In the six months named, American mills produced about 70,000 tons. As the returns of last year's harvest are now exerting their greatest influence upon the general prosperity of the interior, railroad enterprises are much encouraged. If the promised peace of Europe is fully re-inaugurated, there is no doubt that with an average harvest the present year, our railroad extensions will be greater than in any period heretofore. In addition to the requirements for new roads and extensions, the older roads are progressively needing a greater amount of rails for renewals, where in most instances heavier rails are put down. It is worthy of note, that a large portion of the old rails taken up is used in other manufactures, to which this description of iron is regarded by many as being better adapted. The increasing amount of this stock, which comes in competition with pig iron, is worthy of special consideration. Capital is wanted in Pennsylvania, Maryland, Virginia, Missouri, Tennessee, and other States, for the more vigorous and more profitable workings of the extensive iron ores of those States.

Appearances indicate that iron will grow more and more into request—in architecture, ships, and rigging. Wire ropes are now used at many of the mines in the midland and northern counties; and an attempt is being made to introduce them in Devon and Cornwall. At equal strength, a wire rope is lighter by one third than a hemp rope, and by two thirds than a chain; an important fact, especially where mines are deepest. Then we are to have metallic life-boats, pontoons, army-wagons, if the result of experiments made at Woolwich and Rochester may be trusted. The boats, we hear, can not be broken or overset, let them be used ever so roughly; and the pontoons are models of lightness. And again—the United States' Congress have recommended three lines of railway to California: northern, central, and southern, each about 2000 miles in length. The lands granted to the three comprise 131,865,000 acres—a truly gigantic encouragement! What a demand there will be for rails! Then we are to have the often-talked-of railway to India by the Euphrates valley; the route is to be forthwith surveyed. And there is talk of a railway from Honduras across to the Pacific—161 miles, the estimated cost

\$7,000,000, and the expectations of a profitable traffic, fair. To say nothing of the trade from ocean to ocean, there are forests of mahogany and other woods to supply timber-freight for centuries. According to a report in the *Journal of the Society of Arts*, the Honduras government "agrees to give a bounty of 50 acres of land to unmarried, and 75 acres to married laborers who shall go to the country to work on the road, and who shall declare their intention to become citizens."—*Chambers' Journal*. We now subjoin an official summary of the export trade of the United States from 1847 to 1856:

FOREIGN IRON TRADE OF UNITED STATES FOR TEN YEARS.

Years.	American exported.	Foreign consumed.	Excess in foreign consumed.
1847.....	\$1,167,434	\$8,717,656	\$7,550,172

Iron Mountain.—Iron Mountain is situated in St. Francis county, Mo. The land on which it lies was a grant by the Spanish government, when this portion of the south-west was in possession of that government. The grant was confirmed by the Congress of the United States in 1836; but on account of the difficulty of transportation, and of the impression that the ore could not be smelted, this inexhaustible supply was permitted to remain unproductive until 1851, when the Iron Mountain Company was formed and proceeded to the erection of furnaces. The mountain is a flattened, conical shaped hill, with an average elevation above the surrounding valleys of 228 feet, the base of which covers an area of about 500 acres. The ore is the specular iron ore, and is remarkably pure; its average yield, in the furnace, being 56 per cent. From surface indications, and from all explorations made, the whole Iron Mountain seems to be made of iron ore. Almost the entire surface of the mountain is covered with iron ore, the particles increasing in size as you ascend toward the top, until on its summit are found disconnected masses, many tons in weight,

and often six or eight feet in diameter. To what depth the iron ore extends below the base of the mountain, has never yet been ascertained. An artesian well was attempted to be bored by the company, at the base of the mountain, and after attaining the depth of 180 feet, most of the way through iron ore, the work was abandoned. When the boring ceased, the auger rested in a solid mass of ore; so that there is ore under the ground, as well as above it.

Imports of Iron into the United States.—The United States, next to England, may be considered among the leading iron producing countries in the world—England producing 3,600,000, and the United States 1,000,000 tons per annum. Assuming the average price of iron to be \$27, or even \$30, we produce annually to the value of \$27,000,000 or \$30,000,000. From the following table it will be seen that our imports of iron and steel manufactures have gradually reached nearly the same sum. The imports were in

Iron-Wood (Ger. *Eisenholz*; Du. *Yserhout*; Fr. *Bois de fer*; It. *Legno di ferro*; Sp. *Plo hierro*; Lat. *Sideroxylon*, *Lignum ferreum*), a species of wood of a reddish cast, so called on account of its corroding as that metal does, and its being remarkably hard and ponderous—even more so than ebony. The tree which produces it grows principally in the West India Islands, and is likewise very common in South America, and in some parts of Asia, especially about Siam.

Irrawadi (*Eriwadi*, "the great river"), one of the great rivers of south-eastern Asia, is supposed to rise in Tibet, near lat. 28° north, long. 97° 30' east, flows generally southward, traversing the Burmese Empire throughout, and enters the Indian Ocean (Bay of Bengal) by numerous mouths, east of Cape Negrais, in lat. 16° 20' north, long. 96° east. Principal affluents, the Ning-thee, Mogouny, Bharno, and Lung-tchuen Rivers. In lat. 17° north, it separates into numerous arms, which cover the whole kingdom of Pegu with net-work of ramifications, and the Rangoon and Bassein branches form the east and west boundaries of its delta, a region comprising upward of 10,000 square miles, covered with teak forests and grass jungles, interspersed with some rice-grounds. The main stream from the head of the delta to Yedan, above Ava, varies from one to four miles in breadth, and may always be ascended to Ava from the sea by vessels of 200 tons, which, during the rains, can reach the influx of the Mogouny River, 800 miles from the ocean. It is

usually navigable for canoes as high as Bharno, besides which town and Ava, Amarapura, Sakaing, Yandabo, Pagahm Mew, Promé, Henthada, Bassein, and Rangoon, are the principal places on its banks.

Isinglass (Ger. *Hausenblase*, *Hausblase*; Fr. *Colle de poisson*, *Curlock*; It. *Cola di pesce*; Rus. *Klei ribui*, *Karluk*), one of the purest and finest of the animal glues. A variety of gelatine, sometimes called *ichthyocolla*, or fish-glue (from *ichthys*, a fish, and *κόλλα*, glue), prepared from the air-bag, swimming-bladder, or sound of various fishes. The Russian and Siberian isinglass is most esteemed; it is chiefly obtained from sturgeons, a family of cartilaginous fishes of the genus *Acipenser*. The swimming-bladder is cut up, washed, and then exposed to the air, with the inner silvery membrane upward. When dry, this membrane is removed by beating and rubbing; the sound is then prepared in various ways. For forming what is called *leaf* isinglass, it is merely dried; for *long* and *short staple*, it is twisted between three pegs, into the shape of a horse-shoe, harp, or lyre; for *book* isinglass, it is folded like the sheets of a book; for *ribbon* isinglass, it is rolled out. The swimming-bladder of *A. sturio* of the Caspian Sea furnishes leaf isinglass of three qualities, known as *fine-firsts*, *firsts*, and *seconds*. *A. güldenstadti* of the Caspian and Black Seas and their tributary rivers, furnishes *caviare* from its roe or ovary, while the swimming-bladder yields *staple* and *leaf* isinglass. The varieties of staple are *Patriarch Astra-*

khan, and *Astrakhan* *firsts*, *seconds*, and *thirds*. The varieties of leaf are also *firsts*, *seconds*, and *thirds*—the firsts forming the finest leaf known in commerce. *A. rufinus* and *A. stellatus* also yield isinglass. There is a kind known as *Samovey leaf*, from Tanganrod, but this is inferior; there is also the *sisane leaf*, said to be obtained from a small fish, and *kroaki isinglass*, which is made into small membranous disks. Isinglass is also procured from *Siluris glanis*. For *purse*, *pipe*, and *lump* isinglass, the swimming-bladder is dried unopened, and the variety known as *Siberian purse*, of moderately good quality, is greatly in demand.

Brazilian isinglass is obtained from Para and Maranhão, but the fishes which produce it have not been named. For the variety known as *pipe-Brazil*, the swimming-bladders are dried unopened, and made into pipes 10 or 12 inches long, and from 2 to 2½ inches broad, and are sometimes distended with air. *Lump* isinglass is formed by placing two swimming-bladders side by side, and for *honey-comb* isinglass, the largest lump isinglass is split open. There are also varieties of isinglass from New York, from Hudson's Bay, and from the East Indies. In Moldavia a variety is prepared from the skin, stomach, intestines, and swimming-bladder of the sturgeon. These are cut small, steeped in cold water, and simmered. The jelly thus produced is spread out into thin layers, and dried into a kind of parchment, which, on being softened with water, is rolled into cylinders, or extended into plates, and forms an inferior isinglass. Cod sounds are also used for a similar purpose. The *patent gelatin* prepared from glue-pieces or cuttings of hides, etc., after the manner of glue, is also used as a substitute for isinglass. A solid gelatin in thin plates and strings is prepared from bones, and is chiefly of French manufacture.

Isinglass is prepared for sale by being picked and cut. This was formerly done by hand, but is now effected by steam machinery; the thin filaments thus produced should be whitish in color, dry, semi-transparent, nearly tasteless, and quite devoid of smell. Isinglass differs from glue in being tough, fibrous, and elastic, instead of brittle. On boiling, it should completely dissolve, and on cooling, should form a white jelly, soluble in weak acids, but separable from them by alkalis. With milk and sugar it is used as a diet for invalids, and it is also used in the preparation of blanc-mange, jellies and creams, and for enriching soups and sauces. Isinglass is no longer considered to be highly nutritive; it is even less digestible than the flesh or muscular part of animals. The great consumer of isinglass is the brewer, who uses it as a fining material, for which purpose lump isinglass is chiefly used. This is deeper in color, and inferior in solubility to the better varieties. On mixing it with the liquor to be fined, it partly combines with some of those matters which render the liquor cloudy, and entangles in its meshes those which are mechanically suspended, the whole then rising to the surface can be removed; and the liquor be left clear. Wine, coffee, and other liquids are also clarified by isinglass, but sole-skins and hartshorn shavings are often used as substitutes for it. Isinglass forms the adhesive material in court-plaster, for which purpose a solution of isinglass, mixed with tincture of benzoin, is brushed over black sarcenet. Isinglass dissolved in spirits of wine or common gin, and gently simmered by placing the bottle in a vessel of boiling water for about an hour, forms *diamond cement*, or *white fish-glue*; gum ammoniac is sometimes added. Panes of isinglass, instead of glue, are used in France instead of horn, for lanterns, and also for lamp-shades, etc.—E. B.

Isle of Bourbon. Merchandise from Europe, or any country facing the Mediterranean, is inadmissible to the established entrepôt of this island, unless directly imported from French entrepôts, or the place of production; but merchandise of any other origin

may be imported under any flag. This island is situated in the Indian Ocean, between latitude 20° 50' and 21° 24' S., 440 miles east of Madagascar. It is of an oval shape, greatest length 40 miles, greatest breadth 27 miles. Population about 109,000. Area, 900 square miles. It is intersected by two mountain ridges, with volcanoes. There are many small rivers, but none navigable. The valleys of any considerable size are not numerous. It has no safe harbor. The climate is healthy and pleasant. From December to May is the hot and rainy season. The soil is very fertile. In 1836 the surface was distributed into about 65 parts of cultivated land, 14 parts of pasture, 55 parts of wood, and 97 parts of waste lands. The cultivated parts encircle the island, and press up the sides of the interior mountains. The articles produced are the sugar-cane, coffee, cloves, cocoa, tobacco, and grain; of these, the sugar-cane, grain, and coffee are most largely produced. The fisheries are excellent. They employ about 500 persons. The fish taken sell in the island for about \$80,000 per annum. In 1848 the population consisted of 108,000 souls. They have numerous brick and lime kilns, tanneries, forges, foundries, tin-ware factories, breweries, and manufactures of palm-leaf bagging. The principal articles of export are raw sugar, coffee, cloves, dye-woods, cabinet-wood, and saltpetre. The staples are enumerated in the order of their importance, and are of the annual value of about \$5,000,000. The chief imports are rice, wheat, oil, wines, cattle, timber, salt, glass, porcelain, and cottons and other manufactured goods. The total value of the imports is about \$2,800,000.

Isothermal (Gr. *ισος* and *θερμ*, heat). In physical geography, *isothermal lines* are those which pass through those points on the surface of the earth at which the mean annual temperature is the same. *Isothermal zones* are spaces on opposite sides of the equator, having the same mean temperature, and bounded by corresponding isothermal lines. On account of the irregular form and disposition of the continental masses, by which the climate of different places is greatly influenced, the isothermal curves are not parallel to the equator, excepting in the very low latitudes. According to Humboldt, the isothermal line, which corresponds to the temperature of 32° Fahrenheit, passes between Ulea, in Lapland, lat. 66°, and Table Bay, on the coast of Labrador, lat. 54°. The isothermal line of 41° passes near Stockholm, lat. 59½°, and St. George's Bay, Newfoundland, lat. 48°. The line of 50° passes through the Netherlands, lat. 51°, and near Boston, in the United States, lat. 42½°; that of 59° between Rome and Florence, lat. 43°, and Raleigh, in North Carolina, lat. 36°. In all these cases we see that the isothermal lines, in passing from the western side of the continent of Europe to the eastern coast of America, deviate very considerably toward the south; the deviation in one case amounting to 11½° of latitude. In passing over the American continent they again recede to the northward; and in California, and to the north of that peninsula, along the western side of the continent, the annual temperature is nearly the same as under similar latitudes in the west of Europe. From the western to the eastern side of the old continent the flexure of the isothermal curves and the diminution of the mean annual temperature under the same parallels, are not less conspicuous. The isothermal line of 55° passes through Nantes, lat. 47°, and Pekin, lat. 39½°. Edinburgh, and Kasan, in the east of Russia, have the same latitude; but the mean annual temperature of the former is 48°, while that of the second is below 38°. For the different causes which affect the parallelism of the isothermal lines, or which produce the differences of the mean annual temperature of the places under the same parallel of latitude.

Humboldt gives the name of *isothermal lines* (*ισος*, and *θερος*, summer) to the curves passing through those

places at which the mean summer heat is the same; and of *isochimænal* (ἰσος, and χειμὼν, winter) to those which pass through the places at which the mean temperature of winter is the same. The isothermal and isochimænal curves deviate much more from the parallels of latitude than the isothermal. The latitudes of places having the same winter temperature sometimes differ so much as 18° or 20°. The winter of Scotland is as mild as that of Milan. The mean temperature of the winter months at Edinburg is about 38½°; of Kasan, under the same parallel, only 2°. The winter of Pekin is as rigorous as that of Stockholm.—HUMBOLDT's *Fragmens Asiaticques*.

Isthmus, a narrow neck or slip of land which connects two continents; or joins a peninsula to the terra firma, and separates two seas. The most celebrated isthmuses are, that of Panama or Darien, which joins North and South America; that of Suez, which connects Asia and Africa; that of Corinth, which unites the Morea with western Greece; that of Crim Tartary, otherwise called *Taurica Chersonesus*; and that of the Peninsula Romania, and Erisso, or the isthmus of the Thracian Chersonesus, twelve furlongs broad, being that which Xerxes undertook to cut through.

Italy. The name *Italia* was originally applied to the extreme end of the peninsula, south of a line drawn from the Gulf of Squillace, *Sinus Scyllaceus*, to that of Sta. Eufemia, *Sinus Terinæus*. By the time of Thucydides, in the 5th century B.C., the appellation had already extended to Metapontum on the east, and the Posidonian Gulf on the west coast, thus including the whole of modern Calabria, and great part of the provinces of Basilicata and Salerno. The further extension of the name was cotemporary with the progress of the Roman power, and at the time of Pyrrhus it included apparently the whole peninsula, except Liguria and Cisalpine Gaul. In the 7th century of Rome, though both Liguria and Cisalpine Gaul were still, in official usage, distinct from *Italia*, yet the latter name, as we gather from many passages in the classics, was already employed, in common acceptance, to designate the whole country from the Alps to the Sicilian Straits. The official acceptance was dropped as soon as Augustus, in his division of Italy, incorporated Liguria, Cisalpine Gaul, Venetia, and Istria.

The origin of the name has been referred to various sources, all equally uncertain. Greek and Roman tradition deduced it from the eponymous hero Italus, a supposed Enotrian or Pelasgic chief; while Timæus, followed by Varro and Gellius, derived it from *Italos*, which in old Greek signified an ox, from the quantity of cattle bred in the country. *Græcia, enim antiqua, ut scribit Timæus, tauros vocabat Ἰταλός, a quorum multitudo et pulchritudo et fetu vitulorum, Italiam dixerunt.** The word *Vitulus* (calf) and *Italus* were, according to Festus, synonymous; and on the *denarii* struck by the Sabellian nations during the Social War, B.C. 90-88, there occurs the word *Vitelu* for Italy.

In early times Italy was also called *Saturnia* from the Latin god Saturnus, *Enotria* from an ancient chief Enotrus, and *Ausonia* from the Ausones, the *Aurunci* of the Romans, who occupied the centre of the peninsula. All these names, however, seem to have belonged to particular districts, and to have been applied to the whole country only by the Latin and later Greek poets; indeed *Enotria* would appear from Antiochus to have been synonymous with *Italia* in its original acceptance. The Greek poets applied to it sometimes the name *Hesperia*, on account of its being to the westward of their country. The Germans called it *Waelshland*, because the parts nearest to them were inhabited by the Galles or Wallies; and in their pres-

ent language the name of Waelshland is still retained by the common people.

The loftiest range of mountains in Europe on the north-east, north, and north-west, and the sea on every other side, form the natural boundaries of Italy. The Alpine chain, extending in a semicircular form from the Julian Alps at the head of the Adriatic to the Maritime Alps on the Gulf of Genoa, divides it on the north-east from Illyria and the Tyrol, on the north and north-west from Switzerland, and on the west from France, where the River Var (*Varus*) forms its boundary. From this Alpine range, which may be called its basis, Italy projects south-east in a peninsular form, and nearly in the shape of a boot, far into the Mediterranean Sea, which takes the different names of—Adriatic, *Mare Superum*, on the east coast—Ionian, *Mare Ionium*, on the south-east coast, from the Cape of Sta. Maria di Leuca to the Straits of Messina—and of Tyrrhenian, *Mare Inferum* vel *Tyrrhenum*, on the west coast. According to these physical barriers, Trieste and the province of Istria on the east, and Nice on the west, would be excluded from Italy; but ever since Augustus extended its limits to the Var on the west, and the Gulf of Quarnero (*Sinus Flanaticus*) on the east, they have been reckoned as part of Italy. In the present political division of the Austrian empire, however, neither Istria nor Trieste is included in the Lombardo-Venetian kingdom, the limits of which are at the Isonzo, north-east of Aquileia. Along the north and north-west frontier the limits of Italy have at different times undergone various, though insignificant changes; for the Alps, though presenting an unbroken line on a distant view, are so deeply indented with valleys as to make a natural boundary possible only by following the watershed, a course never or seldom adopted in political arrangements. But even the watershed would not mark the limits of different nationalities, as valleys which, by this criterion, should not belong to Italy, are inhabited by an Italian race; and German or French is spoken in districts which should be included in Italy.

The Italian peninsula is situated between the parallels of N. lat. 46° 30' and 37° 54', and E. long. 6° 38' and 18° 32'; if the islands are included, the southernmost parallel of lat. is 35° 40'. Its length in a direct line from the foot of the Alps near Aosta to the Capo di Sta. Maria di Leuca (*Japygium Promontorium*) is about 600 miles, and to the Capo dell' Armi (*Leucopectra*) a little more than 660. Its breadth varies greatly. From the mouth of the Var to the head of the Adriatic, near the Isonzo, it is 300 miles; and if the line be carried to the head of the Gulf of Quarnero, near Fiume, it is more than 350. It narrows rapidly as it descends south; and from Viareggio to Cervia is only 95 miles. Further south it expands a little; and from Piombino to Ancona the breadth is 138 miles, and 150 from Capo di Licosa to Brindisi. From Diamante to the mouth of the Crati, in Calabria, it is 29 miles, and only 18 between the Gulfs of Sta. Eufemia and Squillace. It is surrounded by many islands, the principal of which are: on the east coast the group of the Tremiti, north of Monte Gargano, and S. Pietro and S. Paolo in the Gulf of Taranto; on the south, Sicily, the largest of all, the Lipari group, Pantelleria, Malta, and Gozo, 58 miles from Sicily; on the west, Capri, Procida, and Ischia, at the two extremities of the Gulf of Naples; the Ponza group opposite Gaëta, Giglio near Monte Argentaro, the two large islands of Sardinia and Corsica; and between the latter one and the coast of Tuscany are Pianosa, Elba, and Capraia. The most important of these are noticed under their respective heads in this work.

The sea coasts of the peninsula, on the Tyrrhenian side, are, for the most part, protected by lofty acclivities, but on the Adriatic and the Ionian they are generally flat. The most remarkable capes and promontories of the peninsula are: Delle Melle, Manara,

* Varro, *De Re Rustica*, li. 5.

Piombino, Argentaro, Circello, Miseno, Campanella, Licoso, Vaticano, Delle Armi, on the west shore; Spartivento, Rizzuto, Nau or Colonne, Alice, Leuca, Gargano, on the south-east and east shore.

The extent and population of Italy, including its islands, are shown by the following table, which is to

be considered as merely approximative. In some of the States, the returns of population are not much attended to; and, with regard to their area, there is great discrepancy between the various authorities. This table, however, has been compiled from the most authentic data.

Names of the States.	Episcopal sees.	Extent in square miles.	Jews.	Population.	Capital cities.
Kingdom of the Two Sicilies:					
Naples.....	88	24,962	2,500	6,845,855	Naples.
Sicily.....	14	9,556	2,285,580	Palermo.
Kingdom of Sardinia:					
Piedmont and Riviera.....	26	15,397	4,250	3,946,450	Turin.
Island of Sardinia.....	11	8,223	552,665	Cagliari.
Lombardo-Venetian Kingdom.....	20	18,208	7,000	5,503,478	Milan.
Papal States.....	65	12,120	12,800	3,065,000	Rome.
Grand Duchy of Tuscany (including Lucca).....	21	6,784	7,180	1,817,500	Florence.
Duchy of Modena.....	4	1,629	2,680	606,900	Modena.
Duchy of Parma.....	4	1,712	630	508,800	Parma.
Republic of S. Marino.....	..	18	7,900	S. Marino.
Total.....	251	98,614	87,040	25,148,928	
Corsica, belonging to France.....	1	2,850	236,251	Ataccto.
Malta and Gozo, belonging to England.....	1	114	123,261	Valetta.
Total.....	253	96,578	25,508,585	

The most densely inhabited State is that of Lucca, which contains 525 individuals for every square mile; next to it come the Lombard provinces. The most thinly inhabited parts are the Campagna of Rome and the Island of Sardinia. Italy has more populous towns than any other State of Europe of the same extent. Naples has more than 400,000 inhabitants; Milan, Turin, Rome, and Palermo, each more than 150,000; Florence, Venice, and Genoa, more than 100,000; Leghorn, Messina, Verona, and Bologna, more than 60,000; Parma, Padua, and Catania, more than 40,000; Mantua, Bergamo, Brescia, Ferrara, Modena, Piacenza, Ancona, and Bari, more than 30,000, etc.

The division of Italy into northern, central, and southern, is neither political nor strictly geographical, but is adopted sometimes as a convenient designation of some parts of the country. According to the general acceptance in the peninsula, northern Italy is understood to include Piedmont and the Riviera, Lombardy, the Venetian, Parma, Modena, and the States of the Church, as far as an imaginary line from the Gulf of Spezia to Ravenna; central Italy includes Tuscany and the rest of the States of the Church; and southern Italy the kingdom of Naples. The division in more common use among natives is into upper and lower Italy, the former applying to the portion north of the Apennines and to the Riviera, the latter to all the rest of the peninsula.

The face of the country is much diversified by mountains, of which those forming its northern and north-western boundary have been described in this work under the article ALPS. A second range of mountains, running through its whole length, determines its configuration and its physical character. From the earliest historical times they were called *Apennines*—a name supposed to be of Celtic origin, from its containing the root *Pen*, which in Celtic dialects signifies height or head.

The Apennines may be regarded as a great offshoot of the Alps, from which they branch off near the Gulf of Genoa; but as there is no regular break in the chain, much difference of opinion has prevailed as to the point of their real commencement. Polybius extends the Apennines nearly as far as Marseilles; Strabo, on the contrary, extends the Maritime Alps to Vado, and states that the Apennines begin near Genoa. The latter opinion has been adopted by the best modern geographers, who fix the junction of the Maritime Alps and the Apennines in the valley of the Bormida, west of Savona, where the range, which does not exceed the height of 1300 feet, presents the nearest approach to a break.

All the rivers of Italy are subject to sudden and

very heavy floods, and with the exception of the Po, the Adige, and the Tiber, have their volume of water greatly reduced in summer. The insignificant amount of tide in the Mediterranean renders most of them useless for navigation.

In a country extending through 10 degrees of latitude there must be great differences of climate, and consequently of vegetation and agriculture, from position alone. Besides that, however, the climate of Italy is modified to such a degree by the ranges of the Alps and Apennines, and by the air of the sea along its coasts, as to render useless any division into regions according to the classification of Saussure. In the plains of Lombardy and Piedmont, and the other territories to the north of the Apennines, which are inclosed by mountains on every side but the east, Fahrenheit's thermometer in winter descends to 10°; snow lies sometimes a fortnight on the ground, the lagoons at the mouths of the rivers are frozen, and slight night frosts appear early in November, and some years as late as April. Delicate plants do not thrive except in sheltered situations, but the mulberry-trees flourish, rice is grown, and the pastures are rich. South of the Apennines, that part of Tuscany and the States of the Church which is near their main range is subject to great cold, but westward, and along the Riviera, the temperature grows milder, snow seldom lies long on the fields, and the climate is suitable to the growth of the olive and the orange. But it is when we reach the central range of the Apennines that we find the coldest districts of Italy. In all the upland valleys of the Abruzzi and of Sannio, snow begins to fall early in November, and heavy storms occur often as late as May; whole communities are shut out for months from any intercourse with their neighbors, and some villages are so long buried in snow that regular passages are made between the different houses for the sake of communication among the inhabitants. The district extending from the south-east of Lake Fucinus to the Piano di Cinquemiglia, and inclosing the upper basin of the Sangro and the small lake of Scanno, is the coldest and most bleak part of Italy south of the Alps. Heavy falls of snow in June are not uncommon, and it is only for a short time toward the end of July that the nights are totally exempt from light frosts. Yet, less than 40 miles east of this district, and even more to the north, we find the olive, the fig-tree, and the orange, thriving luxuriantly on the shores of the Adriatic from Ortona to Vasto. In the same way, while in the plains and hills round Naples snow is rarely seen, and never remains long, and the thermometer seldom descends to the freezing point, 20 miles east from it in the fertile valley of Avellino, of no great elevation, but encircled by high

mountains, light frosts are not uncommon as late as June; and 18 miles further east, in the elevated region of S. Angelo de' Lombardi and Bisaccia, the inhabitants are always warmly clad, and vines grow with difficulty and only in sheltered places. But nowhere are these contrasts so striking as in Calabria. The shores, especially on the Tyrrhenian Sea, present almost a continued grove of olive, orange, lemon, and citron-trees, which attain a size unknown in the north of Italy. The sugar-cane flourishes, the cotton-plant ripens to perfection, the date-trees are seen in the gardens, the rocks are clothed with the prickly-pear or Indian-fig, the inclosures of the fields are formed by aloes and sometimes pomegranates, the liquorice-root grows wild, and the mastich, the rosemary, the myrtle, and many varieties of oleanther and cistus, form the underwood of the natural forests of arbutus and evergreen oak. If we turn inland but five or six miles from the shore, and often even less, the scene changes. High districts covered with oaks and chestnuts succeed to this almost tropical vegetation; a little higher up, and we reach the elevated table-lands of the Pollino and the Sila, covered with firs and pines, and affording rich pastures even in the midst of summer, when heavy dews and light frosts succeed each other in July and August, and snow begins to appear at the end of September or early in October.

The cerealia form, as elsewhere in Europe, the chief aliment of the inhabitants; in Italy, however, the lower classes, who are the most numerous, subsist much on maize and beans, which require little preparation to render them fit for food. In some of the southern parts wheat is made use of by the same class, both in the form of bread and in that of macaroni, which is manipulated with great facility. Wheat and maize are, on the average of years, about equal to the consumption, but little can be spared for exportation; and in many of the ports are dépôts of foreign wheat kept to meet the variations of seasons, or to be used as articles of commerce with other countries.

As Italy produces abundance of wine, and consequently needs neither beer nor corn-spirits, no barley is needed for these drinks, and scarcely any is cultivated. Oats are but little grown, but abundance of beans of various kinds are produced. Rye, the common bread-corn of the far greater portion of Europe, is only raised in a few spots in the very northernmost parts of Italy, where it is made into bread for the poor; while those of the higher classes there, as well as throughout the whole peninsula in the cities, make use of wheaten bread. Rice grows in many parts, in fact wherever there is a sufficiency of water to insure a good produce, at such distance from towns as not to be injurious to the health of the inhabitants. It is a part of almost every meal in families in easy circumstances, but is scarcely used by families who are in circumstances that require the practice of great parsimony. A great variety of lupines are used as food, especially in the soups. In some parts of the mountainous regions, chestnuts are a substitute for corn as long as they last. Fruits are plentifully used, particularly figs, grapes, and melons, as food; while the cheapness of onions, garlic, tomatoes or love-apples, and capsicums, render them valuable as condiments. The potato, which in the other parts of Europe has been so much extended of late years, has been but partially introduced into Italy; and, where it is cultivated, it occupies a very small proportion of the soil. Lettuces, asparagus, endive, artichokes, and several kinds of turnips and of carrots, are everywhere grown.

Animal food is far from being extensively used. The oxen yield in some parts excellent, in other very indifferent meat. The mutton is neither good nor abundant, but has been much improved of late years. Swine furnish a plentiful supply during the winter months: they are also prepared as bacon or hams, and above all as sausages, the fame of which latter has

reached unto England under the name of the city of Bologna, where they were early and extensively prepared. The large dairy farms in Lombardy, in which the cheese known by the name of Parmesan is made, and the oak and chestnut forests of Calabria, furnish the most and best swine's flesh.

The fisheries contribute largely to the supply of food in Italy, though from the number of fasts still countenanced by the Catholic church, not sufficient for the consumption; and the deficiency is procured by commerce with the English, French, and Americans, who convey to the sea-ports the salted cod-fish from the banks of Newfoundland. Their own fisheries on the coast give much occupation; the most considerable are those for the tunny, a very large fish, and for the anchovy, a very small one. These are conducted upon a large scale by joint-stock companies. The lakes and the rivers also yield some, though not a great proportion, of that kind of food which ecclesiastical restrictions render indispensable. The sugar-cane is not cultivated in the south of Italy, as it is found, that in point of strength, as well as of cost, the sugar made from it does not succeed in a competition with that substance when imported from the West Indies. The products of agriculture are sufficient for the clothing of all the inhabitants; for though wool is neither good nor plentiful, yet hemp and flax are grown everywhere, are manufactured at home, and, from the nature of the climate, linen can be substituted for woollen dress during most of the months of the year. Some raw wool is, however, imported to supply the manufactures, and some cloths, both from England and France, together with (in Lombardy) those from the other Austrian provinces, especially from Bohemia. Some cotton is grown in the southern divisions of Italy, but not sufficient to furnish materials for their very insignificant manufactures of that article.

The chief product of Italian agriculture is the silk. It is produced from every part, and much of it is converted into articles of dress or of furniture where it is collected; but the chief production of it is in Sardinia, Naples, and Lombardy, whence the looms of England, Prussia, Austria, Russia, and Germany are supplied. The value of this commodity exceeds that of all the other productions of Italy which are exported to foreign countries. The manufacture has of late years made great progress, which it is still steadily maintaining. The great increase which has taken place in the propagation of the mulberry-tree has, within the last 30 years, increased the quantity of raw silk to an extent that had never before been dreamed of.

Another very important Italian product, which is used partly as food, partly employed in home manufactures, and extensively exported as an article of foreign commerce, is the oil of the olive-tree. It is used as a substitute for butter in the south, is much appropriated to the manufacture of many kinds of soap, and is exported to England for the use of our various fabrics, chiefly those of wool, and as a luxury at our tables. The planting and watching cost but little labor or expense, and in a few years the income more than recompenses the labor. The best olive oil is produced near Genoa, in Lucca, in Tuscany, and in Calabria; but it is plentiful throughout the whole of Italy, except in Lombardy and in Piedmont.

The wines of Italy are not very highly valued in other countries, and almost the whole that is produced is consumed at home. Those of the north are for the most part disagreeably acid, and scarcely any of them are or can be preserved beyond one year. The vines are not so much grown in vineyards as in the hedgerows; a system which doubtless injures the quality of the wine. In the southern parts, however, where the vines are grown in low vineyards as in France, the wines are of a more fiery quality, and though prepared with little care, they only require to be better known to be esteemed by foreigners.

The minerals of Italy are of small value; and though mines of gold, silver, and copper were once wrought, the veins have long been exhausted. Some alum is found in the Papal dominions and the Neapolitan territory, some vitriol and antimony in Parma, and sulphur in the island of Sicily. In many places there are excellent marble quarries, the best near Verona and Carrara. Alabaster is found in many of the mountains. The salt manufactured on the seashore, and from saline springs, is more than is required for the home consumption, and a large quantity might be exported.

Direct trade between the United States and Italy is conducted through the ports of Leghorn, Genoa, and Palermo, to which may be added the Austrian port of Trieste. Exports to Sicily, Sardinia, and Tuscany, in 1854, amounted to \$469,143; while to Trieste they reached, during the same year, \$1,751,766. The value

of cotton exported to Sicily, Sardinia, and Tuscany, during the same year, was \$179,093; to Trieste, it reached \$1,370,402. The value of tobacco exported to Sicily, Sardinia, and Tuscany, in 1854, was \$144,082; to Trieste, it reached the sum of \$259,252. A large portion of the exports to Trieste, however, are purchased there for the German markets, that port possessing unusual facilities as a leading entrepôt for many of the States of Germany. Many American vessels clear from the ports of the United States with cargoes destined for the markets of "Italy generally;" at least such would seem to be their mode of clearance, from the custom-house returns; and the average annual value of cargoes thus destined, exceeds the whole amount of cargoes for designated points in the Italian peninsula, except Trieste. The following table exhibits the value of this triangular trade for a period of 36 successive years:

COMMERCE OF THE UNITED STATES WITH ITALY (INCLUDING MALTA TO OCTOBER 1, 1833), FROM OCTOBER 1, 1820, TO JULY 1, 1856.

The mercantile marine numbered at the close of the year 1854, 1,893 vessels (of which 210 were vessels of war), having a total tonnage of 31,637 with 9711 men.—*Foreign Com. U. S.*

Ivory, the name given to the teeth or tusks of the elephant, and of the walrus or sea-horse. Each male elephant come to maturity has two tusks. These are hollow at the root, tapering, and of various sizes, depending principally on the age of the animal. Color externally, yellowish, brownish, and sometimes dark; internally, white. The best are large, straight, and light-colored, without flaws; not very hollow in the stump, but solid and thick. The most esteemed come from Africa, being of a closer texture, and less liable to turn yellow, than those from the East Indies. The trade in London thus divide them:—First sort, weighing 70 pounds or upward; second sort, weighing 56 lbs. to 60 lbs.; third sort, weighing 38 lbs. to 56 lbs.; fourth sort, weighing 28 lbs. to 37 lbs.; fifth sort,

weighing 18 lbs. to 27 lbs. All under 18 lbs. are called *scrivelloes*, and are of the least value. In purchasing elephants' teeth, those that are very crooked, hollow, and broken at the ends, or cracked and decayed in the inside, should be rejected; and care taken that lead or any other substance has not been poured into the hollow. The freight is rated at 16 cwt. to the ton.—MILBURN'S *Orient. Com.*

Supply of Ivory.—The imports of elephants' teeth, in 1840 and 1841, were, at an average, 5556 cwt., of which 4520 cwt. were retained for consumption. The medium weight of a tusk may be taken at about 60 lbs.; so that the yearly imports of 1840 and 1841 may be taken at 10,372 tusks; a fact which supposes the destruction of at least 5186 male elephants! But, supposing the tusks could only be obtained by killing the animal, the destruction would really be a good deal greater, and would, most probably, indeed, amount to about 7000 elephants. Occasionally, however, tusks are accidentally broken, one lost in this way being replaced by a new one; and a good many are also obtained from elephants that have died in the natural way. Still it is sufficiently obvious, that the supply from the sources now alluded to can not be very large; and if to the quantity of ivory required for Great Britain, we add that required for the other countries of Europe, America, and Asia, the slaughter of elephants must, after every reasonable deduction is made, appear immense; and it may well excite surprise, that the breed of this noble animal has not been more diminished. The western and eastern coasts of Africa, the Cape of Good Hope, Ceylon, India, and the countries to the eastward of the Straits of Malacca, are the great marts whence supplies of ivory are derived. The imports from western Africa into Great Britain, in 1840, amounted to 1933 cwt.; the Cape furnished only 97 cwt. The imports during the same year from India, Ceylon, and other eastern countries, were 2418 cwt. The Chinese market is principally supplied with ivory from Malacca, Siam, and Sumatra.

The chief consumption of ivory is in the manufacture of handles for knives; but it is also extensively used in the manufacture of musical and mathematical instruments, chess-men, billiard-balls, plates for miniatures, toys, etc. Ivory articles are said to be manufactured to a greater extent, and with better success at Dieppe, than in any other place in Europe. But the preparation of this beautiful material is much better understood by the Chinese than by any other people. No European artist has hitherto succeeded in cutting concentric balls after the manner of the Chinese; and their boxes, chess-men, and other ivory articles, are all far superior to any that are to be met with anywhere else.

STATEMENT SHOWING THE IMPORTS OF IVORY INTO THE UNITED STATES FOR THE FISCAL YEAR ENDING JUNE 30TH, 1856.

Whence Imported.	Manufactures of. Unmanufactured.	
Russian Posses. in N. America.	\$898
Bremen.....	\$2,018
England.....	9,558	46,558
British Possessions in Africa...	21,945
France.....	4,367	206
Portugal.....	188
Ports in Africa.....	250,278
China.....	2,150	178
Other places.....	102	83
Total.....	\$18,520	\$320,100

Historical Notice.—It is a curious fact, that the people of all Asiatic countries in which the elephant is found, have always had the art of taming the animal and applying it to useful purposes, but that no such art has ever been possessed by any native African nation. Is this owing to any difference between the Asiatic and African elephants, or to the inferior sagacity of the African people? We incline to think that the latter is the true hypothesis. Alexander the Great is believed to have been the first European who employed elephants in war. It appears pretty certain that the elephants made use of by the Carthaginians were mostly, if not wholly, brought from India; and that they were managed by Indian leaders. Some of the latter were captured by the Romans, in the great victory gained by Metellus over Asdrubal. See, on this curious subject, two very learned and valuable notes in the *Ancient Universal History*. BUFFON'S *Article on the Elephant* is a splendid piece of composition.

Rendering Ivory Soft.—The various mechanical and chemical processes connected with the manipulation of ivory, are among the most interesting peculiarities of art. In rendering it soft and transparent, small pieces of the article are laid in strong phosphoric acid until they become transparent, then rinsed in water, and dried in pure linen. When dry it is translucent and hard, but softens as often as it is dipped in warm water or milk. The time of immersion in the acid differs with different pieces of ivory. If certain parts are to retain their original character, they are covered with a varnish before immersion. The acid probably acts by forming an acid phosphate of lime out of the boric phosphate which constitutes three fourths of ivory. The process of hardening ivory, which has become pliable by age, consists in boiling it for some time in a solution of gelatin.

Vegetable Ivory is now imported chiefly from the River Magdalen into Europe and the United States of America; in some years no less than 150 tons of it have been imported into England. The "nuts" may be purchased in the toy-shops of the British metropolis for a few pence each, but when bought in large quantities, they are obtained at a much cheaper rate. In August, 1854, 1000 "nuts" were sold in London for 7s. 6d. The ivory plant is confined to the continent of South America, where it grows between the 9th degree of north, and the 8th degree of south latitude, and the 70th and 79th of west longitude. It inhabits damp localities, such as confined valleys, banks of rivers and rivulets, and is found not only on the lower coast region, as in Darien, but also on mountains at an elevation of more than 3000 feet above the sea, as in Ocam. Among the Spaniards and their descendants, it is known by the name of *Palme de Marfil* (ivory palm); while its fruit is called by them *Cabeza de Negro* (Negro's head); and its seed, *Marfil vegetal* (vegetable ivory). The Indians on the banks of the Magdalena term the plant *Tagua*, those on the coast of Darien *Anta*, and those of Peru, *Pullipunta* and *Homero*. It is generally found in separate groves, seldom intermixed with other trees or shrubs, and where herbs are rarely met with.—*Botanical Magazine*, May, 1856.

Ivory Black. The mixture of charcoal and phosphate of lime obtained by burning bone, is sold under this name, and, like other forms of animal charcoal, is very effective in depriving certain substances of their color.

J.

Jack, in nautical language, is a flag of colors used in making signals. See **FLAGS**.

Jacmel, a sea-port of Hayti. This port, considering the scantiness of its supplies for foreign export, enjoys a considerable share of the navigation of Hayti. It forwards to Port-au-Prince most of the merchandise it imports, especially the large quantities of flax and silk textiles which it receives by the British steam-packets. The first rank in the commerce of this port, formerly held by the British, is now transferred to the United States. In the movements of 1850 there were under the American flag 60 vessels, out of a total of 151; under the English flag, 45 (including their regular royal mail steamers); and under the French flag only 5. The trade and navigation between the United States and the port of Jacmel during the last six months of 1854 is given as follows:—Number of vessels, 30; average tonnage of each, 140 tons; value of cargoes inward, \$661,599 32; value of cargoes outward, not given in official returns. Cargoes inward consisted of provisions, lumber, shingles, and assorted goods. Cargoes outward of coffee, logwood, lignum-vitæ, fustic, braziletto.

Jacobus, a gold coin, worth 25s., and so called from King James I. of England, in whose reign it was struck. There are two kinds of *Jacobus*, the old and new; the former valued at 25s., weighing six penny-weights ten grains; the latter, called also *Carolus*, valued at 23s., and in weight five pennyweights twenty grains.

Jacquard, a peculiar and most ingenious mechanism, invented by M. Jacquart of Lyons, to be adapted to a silk or muslin loom for superseding the employment of draw-boys, in weaving figured goods. Independently of the ordinary play of the warp threads, for the formation of the ground of such a web, all those threads which should rise simultaneously to produce the figure have their appropriate heads, which a child formerly raised by means of cords, that grouped them together into a system, in the order, and at the time desired by the weaver. This plan evidently occasioned no little complication in the machine, when the design was richly figured; but the apparatus of Jacquart, which subjects this manoeuvre to a regular mechanical operation, and derives its motion from a simple pedal put in action by the weaver's feet, was generally adopted soon after its invention in 1800. Every common loom is susceptible of receiving this beautiful appendage. It costs in France 200 francs, or \$40 in this country.

Jade, an ornamental stone, of which there appear to be two varieties, *common jade* or *nephrite*, and *saussurite* or *jade tenace*. Common jade is a silicate of magnesia, oxyd of iron, alumina. Its specific gravity varies from 2.9 to 3.0; hardness 7.0. Its color is leek green, passing into gray. It is very tough, and scarcely fusible before the blow-pipe. Nephrite was formerly worn as a charm, and was supposed to be a cure for disease of the kidney, whence the name from *νέφρος*, kidney. From its toughness it has been used for the blades of hatchets by the New Zealanders, and other savage nations. Humboldt speaks of jade stones being an article of trade among the natives of the north and south sides of the Orinoco. Jade is much used in Turkey and Poland for the handles of knives, daggers, swords, etc.; and in India, ornaments and trinkets, delicately worked, are made of it. In China, the jade is of a whitish color, and is called *yu*. It is formed into vases, rings, and other articles. A great variety of jade ornaments from India and China appeared at the Great Exhibition of 1851. Such articles are very costly, on account of the extreme difficulty

of working this refractory substance, but it has been suggested that mortars, pestles, and some other objects required by chemists, could be manufactured of jade of larger size than can now be made of agate, and, from the simplicity of the forms, at moderate cost. Jade is polished by carnelian, but it takes only a greasy, not a brilliant polish.

Saussurite is a double silicate of magnesia, lime, and oxyd of iron, with silicate of alumina; specific gravity 3.2 to 3.4, hardness 5.5. Its color is greenish-white, or ash-gray; its cleavage is in two directions, meeting at an angle of nearly 120°. Its lustre is pearly, resinous, or vitreous; it is extremely tough, and is fusible before the blow-pipe.—E. B.

Jaffa, or **Yaffa** (the ancient *Joppa*), is a sea-port town of Palestine, in north lat. 32° 3', east long. 34° 45'. It is situate on an eminence projecting into the sea, about 40 miles north-west of Jerusalem. It is mentioned in the Old Testament as the port at which the timber for Solomon's Temple was shipped. During the wars of the Maccabees, its shipping was set on fire by Jonathan; and it was again pillaged during the wars between the Romans and the Jews, 8400 of its inhabitants being put to the sword, and the town burned. Having subsequently become the refuge of pirates, the place was utterly destroyed. Gradually, however, it seems again to have risen to importance, for, during the reign of the Christian emperors, it was made the seat of a bishopric. In A. D. 636 it was taken by Omar. In the crusades it was taken by Baldwin I., and in 1186 retaken by Saladin. In more recent times it was stormed by Napoleon in 1797, when 500 Turkish prisoners were put to death. The harbor of Joppa has always been dangerous, owing to its exposure to the sea, and, being now nearly choked up with sand, vessels are obliged to keep at a distance from the shore. Notwithstanding all the danger and difficulty of landing, Joppa has for many centuries been the resort of pilgrims on their way to Jerusalem. The town chiefly faces the north. The buildings are surmounted by flattened domes, which rise in rows above one another like terraces, on the steep face of the eminence on which the town is built. The summit of the height is crowned with a castle; but though the general situation of the town is thus somewhat picturesque, its appearance on closer inspection is mean and comfortless. A wall 12 feet high defends the town on the landward side, and two forts protect the harbor. Joppa carries on trade in cotton, soap, fruit, coral, etc. The fruits, consisting of water-melons, oranges, lemons, etc., grow well in the sandy soil of the numerous neighboring gardens. It imports rice from Egypt. The inhabitants consist of Turks and Arabs, Romanists and Greeks, with some Armenians, as may be inferred from the three mosques, three churches, and three Armenian convents to be seen in the town. A British consul resides here. Population 4000.—E. B.

Jafna, the capital of the district of Jafnapatam. It stands at some distance from the sea, but communicates with it by a river navigable for large boats, and which falls into the sea near Point Pedro. The town is fortified and possesses a good citadel, which, though small, is exceedingly well built; but it was given up in 1795, after a short resistance, to the British troops. The situation is salubrious, and living is cheap; on which account many families have removed to this place from Colombo. The greater part of the inhabitants are of Mohammedan extraction, and are divided into several tribes, known by the names of Lubbaahs, Moplays, Chittees, and Cholias. The foreign settlers are more numerous than the native inhabitants. There are

manufactures of coarse cotton cloths, calicoes, handkerchiefs, shawls, stockings, etc., and there are also many artificers, such as goldsmiths, jewelers, joiners, and cabinet-makers.—E. B.

Jalap, or **Jalap** (Ger. *Jalapp*; Fr. *Jalap*; It. *Sciarappo*; Sp. *Jalapa*), the root of a certain convolvulus, so named from Xalapa, in Mexico, whence we chiefly import it. The root, when brought to this country, is in thin transverse slices, solid, hard, weighty, of a blackish color on the outside, and internally of a dark gray, with black circular striae. The hardest and darkest colored is the best; that which is light, spongy, and pale colored, should be rejected. The odor of jalap, especially when in powder, is very characteristic. Its taste is exceedingly nauseous, accompanied by a sweetish bitterness.—LEWIS'S *Mat. Med.*; BRANDE'S *Pharmacy*.

In Mexico, from 4000 to 6000 feet above the sea level, grows the plant which yields true jalap, and which has been called by botanists *Convolvulus purga*, and *Ipomœa purga*, the latter name being adopted by De Candolle. It has since, however, been placed in the genus *Exogonium*. The true jalap (*Exogonium purga*) has a tuberous perennial root, a smooth, twining, annual stem, a salver-shaped corolla, with long cylindrical tube, a calyx of five small, unequal sepals, and herbaceous stems. Its leaves resemble the ivy, and its beautiful red flowers open only at night. The dried tubers of this plant supply the drug jalap; these, as found in commerce, rarely exceed 1 lb. in weight; they are oval in form, and covered with a dark skin or cuticle. Internally they are yellowish gray, with deep brown concentric circles, and are hard and difficult to powder. Inferior sorts are more irregular in form, and are called *spurious jalap*, or, from their shape, *cocked-hat jalap*. Some roots are much worm-eaten, and are so called; but as the insects do not touch the resinous portions, such roots are available for extracts. Four kinds of jalap are known in commerce, two genuine and two spurious; first, dark, heavy, resinous tubers; secondly, lighter colored and less resinous; thirdly, *white or false jalap*, pieces of which are occasionally mixed with the true; and, fourthly, *jalap-stalk or woody jalap*, the slices of which are more fibrous and woody than the genuine. There are about 200,000 lbs. of the pure jalap annually exported from Vera Cruz on the Gulf of Mexico, the sea-port of Jalapa.

Jalapa, or **Xalapa**, a town of Mexico, capital of a cognominal department, in the State of Vera Cruz. It is situated on a small plain at the foot of a range of hills 55 miles north-west of the town of Vera Cruz, and about 4500 feet above the sea level. On account of its exhilarating climate it is a favorite resort of the inhabitants of Vera Cruz when the *comito prieto* is prevalent there. The only building of importance is an old church, which is believed by the people to have been founded by Cortez. Cotton is manufactured, but its trade has greatly diminished. In the neighborhood grows the creeping-plant, *Exogonium purga*, or, as it is called from this town, *Jalap*. The population of the department is estimated at 45,000, and the town at 16,000 persons.

Jamaica, an island lying off the Bay of Honduras, between the Caribbean Sea and Gulf of Mexico, within N. lat. 17° 40' and 18° 30', and W. long. 76° 10' and 78° 30', about 4000 miles S.W. of England, 80 S. of Cuba, 90 W. of St. Domingo, and 515 miles N. of Chagres, the Atlantic port of the Isthmus of Panama. It is the most southern of that group, which is called by some the Greater Antilles, by others the Leeward Islands. The latter name, however, is now generally applied to the smaller islands on the north-east, and sometimes to those on the south of the Caribbean Sea. It is the largest, and was formerly the most valuable of the British West Indies, being 140 geographical miles in length, by 50 in extreme breadth, and con-

taining about 4,080,000 acres, or 6400 square miles. Within its government are comprised, besides the three small islands called the Caymanas, Belize, or British Honduras, on the main land of Central America, with Ruatan and other islands in the Bay of Honduras. These places, though distant respectively 600 and 460 miles, have been called the dependencies of Jamaica, and are ruled by superintendents appointed by the governor. The title of Britain was disputed by Spain in the early part of the last century, and the Bay Islands were given up to that power by the treaty of London in 1786, but were re-occupied by the British during the subsequent war. Having, with the Mosquito Territory, formed the subject of dispute between Great Britain and the United States, arising out of the Clayton-Bulwer Treaty, they have (1856) been constituted as free territory under the republic of Honduras, with provisos against alienation, the erection of forts, and the introduction of slavery.

Jamaica was discovered by Columbus on the 8d of May, 1494, while coasting along the south of Cuba, during his second voyage. He called it St. Jago, after the patron saint of Spain, but it is now generally known by its Indian name Jamaica, a word signifying the Isle of Springs, according to the best authorities, though Long derives it from a kind of fruit. It is sometimes written Xaymaca by the Spaniards. On approaching the shore, Columbus called the nearest land after his first ship, Santa Maria, a name still preserved in Port Maria. He effected a landing a little to the westward, at Ora Cabessa, where, after a slight opposition from the natives, he took possession of the country, with the usual formalities, for the king of Spain. The inhabitants were the same mild, inoffensive race as those of Cuba and Hayti. Like the Arowaks of Trinidad and Guiana, they were probably offshoots of the great Mexican stock, and very different from the fierce Caribs of the Windward Islands. After a short stay, Columbus quitted Jamaica, which remained undisturbed for nine years. In June, 1503, on his fourth and last voyage, he was driven by a tempest, in which he lost two ships, to a bay on the north side of the island, which he named Sta. Gloria (now St. Ann's Bay), where he ran his remaining vessels ashore in a small inlet still called Don Christopher's Cove. The shipwrecked mariners were received with the greatest kindness by the Indians, and here Columbus remained upward of a year awaiting the return of messengers he had dispatched to Ovando, governor of Hispaniola, as Cuba was then called. During this time he suffered much from disease, as well as from the mutiny of his followers, whose gross misconduct alienated the Indians, and provoked them to withhold their accustomed supplies, until he dexterously worked upon their superstition by prognosticating an eclipse.

By Esquivel the natives were treated, according to Herrera, with unusual humanity. That his successors did not imitate him in this respect is proved by the astounding fact that of the Indian population, at this time estimated at from 60,000 to 100,000 souls, not a descendant of either sex existed in 1655, when the island fell into the hands of the English, nor, is it supposed, for nearly a century before. After a short sway, Esquivel died in Sevilla d'Oro, a town founded by himself on St. Ann's Bay, which is supposed by some to have been deserted on account of the ravages of ants, by others to have been destroyed during an insurrection of the Indians. Its premature fall was, however, most probably owing to the attacks of French filibustiers, or pirates, who for a long period infested these coasts. The site of the town may still be traced by mounds of earth, as well as in the names of certain fields belonging to the Seville sugar plantation. Melilla, near Port Maria, or, according to another opinion, at Martha Brae, near Falmoth, shared the same fate.

About the year 1523, Diego Columbus, visiting Jamaica from Hispaniola, founded on the River Cobre,

inland to the south of the mountain range, St. Jago de la Vega, St. James of the Plain, which gave the title of marquis to his descendants, and is still the official capital, under the name of Spanish Town. At some distance westward, on the coast, was built Oristan, which is now called Bluefields. Down to 1596 the history of Jamaica is only a record of the rapid disappearance of the Indians, under the Spanish yoke, and of intrigues at the court of Spain, having for their object the dispossession of the descendants of Columbus, whose rights were, however, successfully defended, and eventually centred in an heiress, through whom they passed by marriage to the house of Braganza, reverting afterward to the Spanish crown, in consequence of the revolution of 1640, which placed John, duke of Braganza, on the throne of Portugal. Long anterior to this last event, the union of the crowns of Spain and Portugal, under Philip II., in 1580, occasioned an influx of Portuguese colonists into Jamaica, who contributed much to its strength and prosperity, but were usually on indifferent terms with Spanish settlers. Attention had at an early period been paid to agriculture, the cotton-plant was extensively cultivated, and the sugar-cane, vine, and various kinds of corn and grass had been introduced; and whereas a small species of dog, called the alco, was the only domestic quadruped known to the aborigines, horses, horned cattle, and swine had been imported from Hispaniola, which multiplied amazingly, and a flourishing trade sprang up in lard and hides, as well as tobacco, sugar, and ginger.

The population, according to the return of 1855, consists of 181,633 males, and 195,800 females; but this is based upon the last census, that of 1844, when the population was returned at 380,000, of whom 16,000 were white, 68,000 colored, and the rest black, of whom about 1200 were maroons. Since then upward of 40,000 people have died from cholera and small-pox, and about 2000 have emigrated to Navy Bay to work on the railway over the Isthmus of Panama, a portion of whom only have returned. The careless treatment of children by the negroes, and their almost invincible repugnance to pay doctors' fees, which has necessarily reduced the number of medical practitioners, prevent the natural rate of increase; and the waste of public money during the protracted dispute between the Council and House of Assembly, has caused the number of immigrants imported to fall very short of other colonies. We find, in consequence, that while 49,000 arrived in British Guiana between the years 1840 and 1852 only 14,000 were brought to Jamaica. The following returns have been made by the Emigration Commissioners of Immigrants introduced into Jamaica from 1848 to 1855, both inclusive:

Emancipados from Havana.....	276
Sierra Leone.....	1870
St. Helena.....	2198
Madefra.....	879
China.....	472
Total.....	5,195

Besides which there were still in the island 1684 coolies who had arrived before 1847, and a considerable number of recaptured Africans. The criminal returns of this population are remarkably favorable; the number in prison throughout the island on the 31st December, 1855, was only 583; and Sir H. Barkly reports that the numbers convicted of crimes in Jamaica when compared with British Guiana were as 18 to 33.

The revenue of Jamaica was estimated, in a calculation made in 1830, on an average of ten years, at £490,000 currency, or about £327,000 sterling. This was independent of that raised by the vestries for parochial purposes, which amounted to about £300,000 currency, or £200,000 sterling. The public revenue of 1841 was £226,969, 18s. 3d.; the parochial, £177,491, 12s. 10d. sterling. The public expenditure, £291,-

415, 16s. 0d.; the parochial, £150,857, 16s. 8d. In the year 1854, owing to the suspension of the import and rum duties, and consequent large accumulation of taxable articles which had paid nothing to the treasury, the revenue fell to £96,624 sterling, while the expenditure was £197,638. In 1855 the following return was made: *Income*.—Ordinary revenue, £199,647; casual revenue, £26,771; total, £226,419. *Expenditures*.—Ordinary expenditure, £193,461; casual expenditure, £49,643; total, £243,105. In the same year the local or parochial taxes amounted to about £80,000. In the budget for 1856, the following estimates of the revenue and expenditure for the current year were presented to the Jamaica Legislature:

INCOME.	
Import dues.....	£125,000
Rum duties.....	30,000
Stamps.....	11,000
Tonnage dues.....	11,000
Fees.....	1,000
Stock and hereditaments.....	16,000
House tax (disallowed).....	6,000
Land tax.....	5,000
Interest on guaranteed loan in Colonial Bk.....	1,000
Total income.....	£206,000
EXPENDITURE.	
Collection of revenue.....	£20,105
Parochial items transferred.....	14,058
Church establishment.....	29,398
Administration of justice.....	20,292
Police.....	23,455
Governor and Privy Council.....	4,450
Legislative Council.....	2,064
House of Assembly.....	3,845
Executive committee.....	8,320
Sanitary establishment.....	10,120
Education (disallowed).....	6,000
Printing.....	4,000
Public works.....	3,500
Light-houses.....	1,000
Prisons.....	17,700
Insolvent deposits.....	2,000
Interest on loans.....	33,411
Miscellaneous, including £300 for militia, £800 to geologist.....	3,546
Total expenditure.....	£206,765

By an act of the Assembly in 1854, the Council fund of £6000 a year, originally granted in 1728, ceased, and it was provided that £25,000 should be raised annually as a permanent civil list, for the purposes of the government of the island, and a further sum of £30,000 for the interest on, and repayment of the guaranteed debt.

It is difficult to fix the value of the movable and immovable property in Jamaica, once estimated at £50,000,000. The latter, however, that is, the land with the buildings on it, is periodically valued for taxation, and the hereditament tax is raised upon a sum equal to 6 per cent. on such valuation—that being, according to an arbitrary assumption, the nett revenue of the land. Though the tax is paid upon many properties on which the cultivation has been given up, and which produce no revenue at all, this sum was fixed in 1850 at £693,382, 4s. 3d., on an estimated value of about £11,500,000. Since then the decline has been rapid; and when it is remembered that the fall in ratable property in the next year exceeded £2,000,000, there can be little doubt that the difference in value since the prosperous days of Jamaica amounts to at least 80 per cent. For many once valuable estates no purchaser could now be found on any terms. It is on record that 231 sugar estates have been abandoned, besides 243 coffee plantations, and 182 grass pens. It is notorious that the paper-circulation, which amounted to £258,816 in 1844, has dwindled to £70,000 in 1855. It is clear, therefore, that though the public and parochial taxation has been reduced from about £800,000 currency to less than £300,000 sterling, it is much more burdensome to the tax payer now. Indeed, when it is considered that the value of articles exported, expensive as they are to produce, does not reach £1,000,000, it is evident that the estates in the

aggregate yield no rental at all, but are maintained by non-resident proprietors possessed of other means, who are unwilling to abandon the hope of future improvement. Even supposing the whole money expended in raising these articles of export amounted to little more than double the public revenue of the country, a proportion, highly taxed as the island is admitted to be, quite beyond belief, it would follow that after payment of production, expenses, and taxes, little or no surplus would remain for the proprietor; but such expenses must in reality far exceed £600,000, and can only be provided, as before observed, by those proprietors who have other funds at their disposal.

It is necessary to explain the two forms of calculation to which reference has been made—currency and sterling. The former was an arbitrary mode of reckoning, unrepresented by any coinage, employed until the year 1840, by which £140 currency equalled nominally £100 sterling; but a premium of about 18 per cent. was paid in addition to place this sum in England, so that upward of £166 in Jamaica were needed to pay £100 in England. In 1840 an act passed establishing the English computation, fixing the pound sterling at \$5, or £1, 13s. 4d. currency, and making English money the legal tender. Spanish and Portuguese coins are still current, the highest being the doubloon, or ounce, worth about £3, 6s. 8d. Before this date, a "fivepenny," worth 3d. sterling, was the lowest coin. There is still no copper, and the lowest coin is the silver three-halfpence, coined especially for Jamaica, and called a prædial, as intended for the payment of agricultural laborers. In former days, the only paper currency consisted of island checks issued by the treasury. There are now two banks of issue, a branch of the Colonial Bank, and the Bank of Jamaica. A third, the Planters' Bank, has been given up since the trade of the colony declined. The present issue is usually from £70,000 to £80,000. Savings banks have also been established in the island.

The commerce of Jamaica depends almost entirely on its agriculture. It has gradually lost the greater portion of the transit trade in consequence of the revolt, and subsequent disorganization of the Spanish colonies on the mainland, the establishment of St. Thomas as a free port, and the rapidity of steam communication between Europe and the American coast, which diminished the advantages of an emporium in the West Indies. Its agricultural prosperity has declined in equal proportion, though, from different causes, the value of its staple having been depreciated by successive acts of the Imperial Government, whereby the differential duties, under the protection of which

the scheme of emancipation was originally intended to be carried out, were discontinued. In 1840 East India sugar was admitted on equal terms into the British market. Four years afterward the same advantage was conceded to foreign sugar, the produce of free labor; and in 1846 to slave-grown sugar. Protection has also been removed from molasses, coffee, and cocoa. Under these circumstances, the want of adequate labor has prevented Jamaica competing with those countries in which, from slavery and other causes, there is a sufficient supply.

The following tables illustrate these observations:

Years.	Value of imports.	Value of exports.
1809.....	£4,068,897	£3,093,294
1810.....	4,808,887	2,808,579
1853.....	864,094	837,276
1854.....	408,520	932,316

The exports consist of her own products only, the imports include those intended for re-exportation, as well as those taken for home consumption, which explains why, in the flourishing era of the transit trade, the balance should be apparently so much against Jamaica. The exports, too, are entered at their value in the place of growth, while to imports are added charges for freight, etc. The small imports of 1854 were partly owing to the goods imported in anticipation the year before, when the duties were not levied. The same cause accounts for the small quantity of rum exported in 1853, and the excess of the two following years, enough for two years' home consumption having been entered in the same year duty free. The following table gives the trade and navigation report for 1855:

ARRIVALS IN JAMAICA IN 1855.

From	No. of ships.	Tonnage.	Men.	Value of imports.

* No return.

The largest sugar crop was in 1805, which exceeded 150,000 hhd. ; that of 1855 did not reach 30,000 hhd. ; that of 1856 had fallen to 20,000 hhd. The largest coffee crop was in 1814, and exceeded 34,000,000 lbs. The great increase of pimento is unfortunately accounted for by the rapid spread of the tree, which grows wild in Jamaica, over lands formerly under cultivation. Since 1852 a small quantity of copper ore has been exported, amounting in 1854 to 37 tons. Besides these principal articles, there is exported a small quantity of tamarinds, cocoa-nuts, succades, shrub, ebony, lignum vite, and lancewood. There are five mining companies in Jamaica, all in their infancy—the Clarendon Consols, and Wheel Jamaica, in Clarendon; the Port-Royal and St. Andrews, and the Ellers-

lie and Bardowie, in St. Andrew; the Portland Mining Company in Portland. Of these the first two are at present the most promising. The principal imports into Jamaica are salt pork and beef, salt fish and oil, butter, lard, cheese, corn, corn-meal, oatmeal, flour, biscuits, rice, tobacco, wine and beer; hardware, cutlery and ironmongery; ready-made clothes, boots and shoes, and dry goods of all sorts; soap, candles, saddlery, and harness; shingles, lumber, wood-hoops, and coals.

Imports into the Island of Jamaica from the United States in 1854.—Flour, 13,823 barrels; candles, 7941 boxes; butter, 2378 kegs; lard, 2577 kegs; pork, 1433 barrels; hams, 20 barrels, 15 casks, 11 tierces; cheese, 108 boxes; meal, 2614 barrels; corn, 2191 bags;

bread, 977 barrels; beef, 241 barrels; coals, 3301 tons; lumber, 33,186 feet; rice, 1542 bags. Approximate value, \$499,515.

American vessels engaged in trade with Jamaica in 1852, 194; in 1853, 164; from all European ports, in 1852, 119; in 1853, 155.

The commercial resources of this island may be seen from the following tables of exports for three years, 1850-1852:

	1850.	1851.	1852.
Sugar.....bhd.	36,030	40,293	34,414

Molasses.....casks	9	40	11
Ginger.....lbs.	799,000	1,176,000	994,000
Pimento....."	4,059,000	4,439,000	5,438,000
Coffee....."	127,000	5,595,000	7,127,000

Port Regulations.—On every vessel entering Jamaica, there is levied under the customs-tonnage act, a port duty of 24 cents per ton. Light-house duty, 6 cents per ton. Hospital tax—vessels from out of the tropics, 8 cents per ton; from within the tropics, 4 cents per ton. Health officer's fees—on a ship or bark, \$2 88; on a brig or brigantine, \$2 16; on a schooner or sloop, \$1 44. Harbor dues—ship or bark, \$7 68; brig or brigantine, \$5 76; schooner or sloop, \$3 84. Jamaica embraces an area of 5520 square miles, and contains a population of about 36,000 whites, and 312,000 free blacks. Total population, 348,000.

Pilot dues in the ports of Kingston and Port Royal.—In—350 tons and over, \$23 04; 250 tons and over, \$17 28; 150 tons and over, \$14 40; 100 tons and over, \$11 52; 100 tons, \$5 04.

Out—350 tons and over, \$15 36; 250 tons and over, \$13 44; 200 tons and over, \$11 52; 150 tons and over, \$9 60; 100 tons and over, \$7 68; 100 tons, \$6 72. These charges are reduced when the vessel enters or clears from Port Royal only.

There is a steam communication between England and Jamaica, and *vice versa*, twice a month, in 19 days. The Royal Mail Steam-packet Company's ships leave Southampton on the 2d and 17th of each month, calling at St. Thomas, Porto Rico, and Jacmel, in Hayti, and reach Kingston on the 21st and 6th. They leave again for England on the 27th and 12th, making the course of post about 44 days. They also sail once a month between Jamaica and Honduras; course of post 10 days. There are frequent opportunities between Jamaica and Havana, and the United States. In the island there is a post twice a day between Kingston and Spanish Town, and a communication twice a week between these capitals and the country districts; besides expresses, on the arrival and departure of the mail packets. Jamaica being on the direct route from England to Nicaragua, can scarcely fail to share in the growing importance of the States of Central America.

Emancipation.—Hitherto its history, since emancipation, has been discouraging to the friends of liberty. The negro on whom the cultivation of the island depends, has gradually retired from labor, and retrograded in the social scale. This does not arise from any hostile feeling toward the whites, with whom he usually lives on the most amicable terms; it is the natural result of removing all restraint from a people low in civilization, and consequently with few artificial wants, in a country where land is superabundant. The Jamaica negro can earn enough on a sugar plantation in a few weeks to buy a small patch of freehold land. The wood upon it forms his cottage; and the vegetables which grow almost spontaneously support him in tolerable comfort. When his little property does not require his care, he works from time to time for hire; but as plantation after plantation is abandoned, and the country returns to its primeval forest, he is confined more and more to the society of his own race; and though not more addicted to crime, is rapidly receding into a savage state. During slavery the dissenting ministers possessed great influence over him;

he now prefers the established church, because it costs him nothing, but he cares little for either. Not feeling the want of education, he does not seek it for his children, whom he prefers employing in his own service. Hence, neither churches nor schools are wanted in Jamaica, but congregations and scholars. These observations are confirmed by the last returns, which fix the diminution of children in the schools in 1854, as compared with the previous year, at 2000, and show this decrease to be less conspicuous in those belonging to the established church of England and Scotland, than in those of the Baptists and Independents. We can scarcely blame the negro for following the bent of his inclination; but it is evident that under these circumstances, unless there is a large and immediate supply of immigrants, to meet the expense of whose introduction, averaging at least £10 per head, there are no available funds, all society will come to a speedy end, and the island become a second Hayti. Already the enormous depreciation of property has caused the ruin of so many, that the name of Jamaica proprietor, once used proverbially to indicate wealth, is now associated with poverty and distress.

Jamaica is of a long oval shape, and has been compared to a seal with the head pointed to the west. Its surface is beautifully diversified with hills and valleys. An elevated range, called, in the eastern or highest part, the Blue Mountains, and terminating in Dolphin Head, to the west, runs longitudinally through the island, and other high ridges intersect this chain. On the south the mountains are generally steep, with gigantic spires or buttresses rising from the plain at an average distance of 12 miles from the sea. Though difficult of access they are traversed by bridle-roads in various directions to the height of nearly 6000 feet; and several passes, or gaps, as they are called, of great altitude, connect the two sides of the island. On these elevated ranges the coffee attains the greatest perfection, and above, dense forests ascend to the highest peak, composed chiefly of beef-wood, as it is called from its color, and satin-wood. Under their shade the tree-fern grows to the height of 15 feet, and the flute-like note is heard of the solitaire, a bird only found in these wildernesses. On the north side the mountains approach the sea closely, but more gradually, their conical forms are gently rounded, and in St. Ann and Trelawny the lower slopes are shaded by pimento woods, the indigenous growth of the island, and elsewhere by orange groves, mango, and cedar forests, above which frequently towers the gigantic silk-cotton tree. The shady valleys between were once occupied by cacao walks, now destroyed; and on the lowlands, near the sea, were formerly the indigo-works, long since abandoned. Here are now the sugar estates, in which the dark green of the cane is varied by the golden tint of the guinea grass, and the cabbage and cocoa-nut palms shoot up in long lines close to the water's edge, from which they are separated by a fringe of mangroves, growing below high-water mark, and the beautiful but poisonous manchineel. The waving field of canes is broken at intervals by the white cluster of buildings composing the sugar-works. The mill, the boiling-house, with its tall chimneys, and the stables, stores, and bookkeepers' houses surround a large court-yard. Above, on an eminence, is usually the proprietor's mansion, and close by, though completely buried in the broad foliage of the plantain and banana, the negro village. On these plantations during crop the scene is most animated. Bands of negroes, with cutlasses, attack the rows of canes which tower above their heads; wagons, drawn by oxen or mules, in endless succession, carry the canes to the mill; women and children hurry with the dry stalks to feed the fires; and the shouts, without which a negro seldom does any thing, announce afar off, in this clear atmosphere, the neighborhood of a sugar estate. It is here, too, that the traveler sees most clearly the

decline of the country. At each end of the island, in the parishes of Hanover and Portland, he may journey for miles through deserted plantations. Ridges, overgrown with guava bushes, mark the site of the corn fields; rank vegetation fills the court-yard, and even bursts through the once hospitable roof. A curse seems to have fallen upon the land, as if this generation were atoning for the sins of the past. For while we lament the ruin of the present proprietors, we can not forget the unrequited toil which in times gone by created the wealth they have lost, nor that hapless race, the original owners of the soil, whose fate saddens the darkest page of history.

The sugar estates resemble generally those of the other islands, but Jamaica has a feature peculiar to itself. In the centre of the island, and toward the south and west, are large plains, or table-lands, at an elevation of about 1000 feet, covered with a luxuriant growth of guinea grass, dotted with groves of tall trees, and, at greater intervals, with white houses and villages. From an eminence the whole country resembles a series of English parks. These are the pens, or grazing farms, where horses and cattle of most excellent quality are bred. They are chiefly in St. Ann, Manchester, St. Elizabeth, St. James, and Hanover. The climate, at this elevation, is well suited to a European population, who can not work on the sugar plantations, but may with safety be employed on the light and healthy duties of the farm. From one of the many points of view on the mountain range the country presents an aspect of beauty and grandeur scarcely to be surpassed. Above tower the lofty peaks, with clouds on their summits—around are magnificent forests—beneath are the peculiar hollow basins, called cock-pits—below them deep ravines, or wider valleys; through these flow rivers or mountain torrents, occasionally falling from the rocky ledges in cascades which would attract notice in any part of the world. At a greater distance the wide plains are spread out like a map, checkered with towns and villages; and the deeply indented coast, terminating to the east in lofty cliffs, is washed by the glittering waters of the Caribbean Sea. The view of the island from the sea has long been celebrated. Soon after leaving Cape Tiburon, the western point of Hayti, the Blue Mountains are in sight, and along the south coast of Jamaica, from Point Morant to Kingston, the inhabited plains, sloping gradually up, till cultivation terminates in forest, present an aspect of no common beauty. From Fort Nugent, which is conspicuous under a steep hill, to Port Royal, runs a narrow sandy promontory, called the Palisades. Here is the great cemetery where so many victims to yellow fever lie buried that the name has become proverbial; and this neck of land incloses the harbor of Kingston, which is entered by a most intricate channel between Port Royal and Port Henderson, and beyond which the capital is seen stretching northward toward the amphitheatre of the Liguana Hills, and protected by the loftiest range of the Blue Mountains. The heights of the principal peaks have been computed as follows: Blue Mountain Peak, 7770 feet; the Portland Gap ridge, 6501 feet; Portland Gap, 5640 feet; and St. Catherine's Peak, 4970 feet. It is stated, however, by some authorities, that the three highest peaks on the grand ridge of the Blue Mountains, called Coldridge, have their respective summits 8184, 7656, and 7576 feet above the level of the sea.

The soil is in most places deep and fertile, and for the growth of sugar, pimento, and ginger, and, as some think, of coffee, has never been surpassed. On the north there is a reddish yellow soil. The brick mold, reckoned the best in the West Indies for the cane, is a deep warm hazel mold, easily labored, and requiring little manure. The black shell mold owes its fertility to the mineral salts and exuvies which it contains. On the south side are large natural salt

ponds, which of late years have been neglected. The principal soils in the interior are a red clay, a yellowish clay, a red grit, a loose conchaceous mold, a black mold or clay or marl, a loose vegetable mold on rock, a fine sand. The red sandstone of the lower mountains resembles much the porphyrite conglomerate of the higher, and both produce coffee; but while that grown on the former has been driven out of the market by the cheaply grown coffee of Ceylon, the latter retains its value, being considered by many superior to the Mocha which springs from a similar soil. Among minerals are—argillaceous dark purple schist; gneiss; steatite, and even serpentine; sienites, highly micaeous; and the hard lamellated amianthus, resembling petrified wood; white freestone; quartz of different kinds; limestone, and a kind of marble. Rich lead ore, impregnated with silver is found in St. Andrew; radiated antimony and rich copper ores, abounding in malachite, are found chiefly in Clarendon, Portland, and St. George; magnetic iron and cobalt in St. George and Metcalf; anthracite coal in Portland and St. George; but neither gold nor pure silver have been found, though the Indians possessed ornaments of both when discovered by the Spaniards. A species of marl, common in Jamaica, was eaten by the negroes during slavery, so much to the detriment of their health and value that the practice was made penal. The honeycomb limestone rock, of which a great part of the island is composed, contains no minerals, but is hollowed into innumerable caverns and fissures. Many of these are beautifully ornamented with stalactites, particularly one on the Roaring River estate, near Savana la Mar. In some of these fissures called "sinks," rivers suddenly disappear to rise again at a considerable distance. On the Sweet River estate several springs rise like fountains with great force in one field. On the road from Falmouth to Maroon Town, a considerable stream pours from an opening in the solid rock several feet above the ground, and the Rio Bueno streams at once from the foot of a perpendicular rock in St. Ann. There are fewer traces of fire in Jamaica than in the other islands; but the Burnt Hill, near Hope Bay, seems to be an extinct volcano. There is great variety of climate; the medium heat at Kingston is about 80°, and the minimum 70° Fahrenheit, throughout the year. At an elevation of from 4000 to 5000 feet, the average range is from 55° to 65°; the minimum in winter being 44°. On the Blue Mountain Peak, in August, the writer found the temperature 44° at sunrise, and ice of some thickness has been formed there in March. Snow has never been known to fall. The alternation of temperature is from 8° to 10° on the south side, and more on the north, but the transitions are not so sudden and detrimental as in many parts of the continent of North America. The grand compensation for excess of temperature is afforded by the breezes which regularly every morning set in from the sea to the land, and every evening from the land to the sea, to preserve the equilibrium which the noonday sun has disturbed; when these are sometimes interrupted the heat is intense, the thermometer rising to 100° Fahrenheit, and the island becomes unhealthy. There is no striking variety in the length of the day, or in the seasons, except the alternations of wet and dry. Storms of thunder and lightning are prevalent, and sometimes very mischievous in autumn. The hurricane season ranges from July to October. The periodical rains, which last ordinarily for six weeks, are called the May and October seasons, but there is great irregularity in the time of their falling. The north side usually suffers less from drought than the south, but even there the rains are sometimes very capricious, following the course of a river, or being stopped by a ridge of hills. The parishes of Vere and St. Dorothy, on the south side, have sometimes been more than a year without rain, to the destruction of vegetation and cattle.

Some parts of Jamaica, particularly near morasses, are extremely unhealthy, and there few escape intermittent fevers, or "fever and ague," as it is called; but in general the climate is favorable to those who live carefully, though when the yellow fever comes as an epidemic, which happens every seven or eight years, it carries off all alike. It is, however, rarely known at an elevation of 1000 feet, and in some of the hilly districts, especially the Santa Cruz Mountains and Pedro Plains, there are remarkable instances of longevity among the English settlers. The annual mortality among the white troops for twenty years ending 1837 was 180 in the 1000, or a seventh of the entire force. Since they have been fed on fresh provisions, and more especially since they have been encamped on high ground, this has been reduced to 34 per 1000. Of late years the cholera has made its appearance, and committed extraordinary havoc; and since emancipation, small pox has been more prevalent, on account of the negroes neglecting the vaccination of their children. The vegetable productions of Jamaica are far too numerous to be described. There are forest trees fit for every purpose, from ship-building to cabinet-making, among which the ballata, rosewood, satinwood, mahogany, lignum vitæ, lancewood, and ebony, are conspicuous; but the scarcity of labor makes it cheaper to import planks ready sawn from America. The logwood, the trunk of which resembles the clustered columns of Gothic architecture, and the fustic, are largely exported for dyeing. The Jamaica cedar (*Cedrela odorata*), with ash-like leaves, is valuable for the interior of houses, as its scented wood keeps off insects. The silk-cotton tree (*Ceiba Bombax* or *Eriodendron*) is one of the largest in Jamaica; its silky pods are used to stuff pillows, but, from want of adhesion in the fibres, is useless for manufacture. The pimento is indigenous, and furnishes the allspice. The bamboo, the coffee, the cacao or chocolate tree, are well known productions; the last, however, is disappearing, and the export has ceased. Several species of palm abound, the macca, the fan palm, and screw palm, but the noblest is the palmetto royal (*Areca oleracea*), the green top of which is called the mountain cabbage, and eaten as a vegetable. The cocoa-nut is the most valuable of all this tribe. The mango, which overspreads the island, forming a splendid forest tree, and affording food for man and beast, was introduced by Rodney, who took it from a French ship; the bread-fruit by the famous Bligh in 1793. The papaw has the peculiar property of rendering meat tender. The lace-bark tree, found near Maroon Town, has an inner bark of so delicate a texture that ladies' dresses have been made of it. The guava, from which the delicious preserve is made, is a weed of the country, and the fruit when raw scarcely eatable. The palma christi, from which castor oil is made, is a very abundant annual. A new species of silk-worm (the *Bombyx Cynthia*), which feeds on its leaf, has lately been introduced from India, by the Jamaica Society of Arts, founded by Sir C. Grey. The sunflower is sometimes cultivated for oil. A variety of the *Cactus Opuntia*, on which the cochineal feeds, is common, and from which, as well as from the insect, recent experiments have proved that a dye may be obtained. English vegetables grow in the hills; while the plains produce the plantain, cocoa, yam, cassava, ochra, beans and peas of various sorts, ginger, and arrowroot. Maize and guinea corn are generally cultivated, and the guinea grass, accidentally introduced in 1750, has overspread the whole island, and forms the most wholesome and strengthening food for horses and cattle. The principal fruits are the orange, the shaddock, the lime, the grape or cluster fruit, the pineapple, naseberry, granadilla, star-apple, custard-apple, mammee sapota, mango, banana, grapes, melons, the avocado pear, the bread-fruit, and tamarind, though the last three would be more correctly ranked

among vegetables. There is a botanic garden near Kingston, and a finer one at Bath, where many now naturalized exotics were first planted. The sarsaparilla is erroneously supposed to grow in Jamaica, though it is classed in the customs' returns there among the imports. It is brought from the Spanish main, and re-exported by the Jamaica Jews, in whose hands the trade is; hence it is called Jamaica sarsaparilla. The sugar-cane was cultivated at an early period in Jamaica by the Spaniards, and was so much extended by the English that, in 1671, we read of sugar works scattered over the whole island. There are several varieties, the most valuable being the one brought from Bourbon in 1799, which is of a bright yellow; and the Mont Blanc, of three sorts, white, violet, and blue. Besides which is the ribbon-cane, beautifully striped with various colors, which is coarse and dry, but more hardy than the other sorts. The statistics of the sugar and coffee cultivation have been given elsewhere. There are many beautiful flowers in the island, the most remarkable of which are the aloe, the yucca, the datura, the mountain pride, the portlandia; the cactus and cereus tribe, the various kinds of convolvulus and ipomœa, and two beautiful descriptions of plumeria, called the tree jasmine. Innumerable varieties of ferns grow in the mountains, and orchids in the woods. The pastures are infested by that interesting minosa, the sensitive plant. It is eaten by sheep, but is armed with minute thorns, which make troublesome wounds in their feet. There are many beautiful insects, among which the fire-flies are most remarkable. There are fourteen sorts of *Lampyridæ* or fire-flies, besides the *Elateridæ* or lantern beetles, which are larger and more luminous; but neither in flowers nor insects is Jamaica so rich as more southern islands. To compensate for this it has no venomous serpents, though abounding in harmless snakes and lizards. A large lizard, the iguana, is considered a delicacy, as are the land-crab and tortoise. The scorpion and centipede are poisonous, but not very common or dangerous. Ants, mosquitoes, and sandflies swarm in the lowlands. Bees, among which is a stingless variety, are numerous in the woods, and produce excellent honey. It is a popular error that in the tropics flowers have no scent and birds no song. The datura and orange are among many instances to the contrary in the former case; and as to the latter, Goss enumerates some twenty different song birds in Jamaica, among which may be mentioned the Jamaica nightingale, a kind of mocking-bird (*Merula Jamaicensis*), and a species of humming-bird (*Mellisuga humilis*). Parrots and pigeons are common, and the wild guinea fowl; also a species of goatsucker, called the mosquito hawk, and a great variety of water-birds, among which is the pelican and a sort of albatross. The crane, heron, plover, snipe, ortolan (or rice-bird of Carolina), and quail, are migratory. The aura vulture, or turkey buzzard, called the John Crow, is numerous, and valuable as a scavenger. By its instinct the concealed body of a murdered man has more than once been traced in Jamaica. The sea and rivers swarm with fish; among the larger ones are the shark, the nurse shark, the bonito, the sword and saw-fish; besides the snapper, mullet, king-fish, Spanish mackerel, the flying-fish, etc. The cachalot is found. Turtles abound; and the seal and manatee, or river cow, are sometimes found, and the crocodile (called erroneously alligator). Jamaica, when discovered, contained but few species of animals. Besides the alco, there was the utia or Indian cony, the muskrat, the armadillo, monkey, agouti, peccary, opossum, and raccoon. At present the only wild animals are the wild hog (an African variety, introduced from the Canaries), a kind of deer (the cariacou), goats, rats, and mice. The rats commit serious ravages among the canes, and those which feed only in the cane-fields are by some esteemed a delicacy. This species, called the

Charles Price rat, was introduced to destroy a smaller kind; but the remedy seems to have proved worse than the evil. The breed of oxen has been much improved by judicious crossing, and can scarcely be surpassed. The horses have much of the Arab blood. They are small but fleet, and at the island races have often beaten English racers, particularly some taken out by the Marquis of Normanby, when governor. The Cleveland bay has lately been introduced from England, with a view to size and bone. The mules are large, hardy, and sagacious, and much used for mountain-riding, as well as for carrying baggage and working on the estates. The sheep and pigs are of excellent quality, and the pork of Jamaica is considered much more wholesome than that of England, being frequently recommended to invalids. Goats are much reared by the negroes, but they are very mischievous in sugar and coffee plantations. The Cuba bloodhound is used as a watch-dog, being the species which thrives best in a hot climate; the English hound and terrier, which have frequently been introduced, soon degenerate and die. Poultry succeeds well, particularly the turkey, the Guinea fowl, and Muscovy duck.

The principal publications relating to Jamaica are: LONG's *History*, 1774; BRYON EDWARDS' *History*, 1809, with an Appendix, 1819; RENNY's *History*, 1807; MATHISON, 1811; HOWARD's *Laws of Jamaica*, 1827; BECKFORD's *History*; DALLAS' *Maroon War*; STEWART's *Jamaica*; MONK LEWIS' *Tour*; MADDEN's *Jamaica*; MONTGOMERY MARTIN, 1836; PHILIPPO's *Past and Present State of Jamaica*, 1843. The earlier histories are scarcely applicable to the present day, while many of the later publications are mere vehicles for conveying the authors' views for or against slavery. By far the best and most reliable information is contained in the dispatches of successive governors, published in the Parliamentary Blue Books; many of which, and particularly those of Sir Charles Grey, contain admirable expositions of the state of the country, and causes of its decline. The natural history of Jamaica has also been the theme of many writers—Sloane, in 1692; Brown, 1754; Barham, 1794; Lunan, 1814. These authors have a most able and enthusiastic successor in Gosse, whose *Journal of a Naturalist in Jamaica*, 1851, and *Birds of Jamaica*, 1847, are delightful books. For vivid pictures of scenery and life in Jamaica, *Tom Cringle's Log*, and *The Cruise of the Midge*, by MICHAEL SCOTT, a Kingston merchant, are unrivaled.

The Caymanas, or Cayman Isles, are three small coral islands or keys, in N. lat. 19° to $19^{\circ} 20'$, and 30 to 40 leagues west north-west from Point Negril, Jamaica, and about the same distance south of Cuba. Grand Cayman lies off the centre of the Yucatan Passage; Cayman-Braque or Brac, and Little Cayman, are near each other, and about 34 miles north-east from Grand Cayman. They were discovered by Columbus, but no settlement was ever made by the Spaniards. Grand Cayman, the only one occupied, is about a mile and a half long by a mile broad, and contains about 1000 acres. It is very low, entirely without springs, and overgrown with low stunted shrubs. These islands are favorite breeding-places for turtles, immense shoals of which animals frequent the low sandy shore for the purpose of depositing their eggs.

James, Capt. Thomas. This English navigator was employed by a company of merchants of Bristol, in connection with one Luke Fox, in 1631, on a voyage of exploration for the discovery of a north-west passage. Sir Thomas Roe presented him to Charles I., who greatly encouraged the enterprise. He sailed from the port of Bristol on 8d May, and wintered on an island in Hudson's Bay, in latitude about 52° , from whence he proceeded northward as far as 65° ,

when his further progress was prevented by the great accumulation of ice, and he returned to England, where he arrived 22d October, 1632. During the ensuing year, he published his "Strange and Dangerous Voyage for the Discovery of a North-west Passage to the South Sea." He made some discoveries on the coast of Hudson's Bay, to the western side of which country he gave the name of *New Wales*, in honor of the prince, afterward Charles II. His journal contains much curious and interesting matter connected with the sufferings of himself and his companions during their sojourn on the Isle of Charlton.

Japan. The empire of Japan consists of a chain of islands lying off the eastern coast of continental Asia, and extending south-east and north-west between north lat. 31° and 48° , and east long. 129° and 150° . Inclosed between this chain of islands and the opposite coasts of Corea and Manchu Tartary, is the Sea of Japan, which communicates by means of straits with the Chinese Sea on the south, the Pacific Ocean on the east, and the Sea of Okhotsk on the north. To the east, Japan has no nearer land than California, 5000 miles off; the nearest part of China is about 420 miles, and of Kamschatka 270 miles distant. The term Japan is probably a corruption of the Chinese name, *Ji-pun-quo*—i. e., Kingdom of the Source of the Sun, or Eastern Kingdom. Marco Polo, who was the first to bring intelligence of this country to Europe, and who acquired his information in China, calls it *Zi-pangu*. The Japanese name is Nipon, or Nifon—i. e., Sun-source.

The empire is divided into Japan proper—consisting of the three large islands of Nipon, Kiu-siu, and Sitkokf, and the numerous small islands. Nipon, the largest and most important of the group, and that which gives name to the whole empire, has an estimated area of 100,000 square miles; its length being more than 900 miles, while its average breadth exceeds 100. It is thus about one fifth larger than Great Britain. Its form is that of a curve or crescent, with the concave side toward the main land. South of Nipon, and separated from it by a narrow channel, is the island of Kiu-siu, or Ximo, about 200 miles in length and about 80 in average breadth, thus containing an area of about 16,000 square miles. Lying north-east of Kiu-siu, and eastward of the southern extremity of Nipon, is the island of Sitkokf, or Sikoko, about 150 miles in length by 70 in average breadth. It is separated from Nipon by a long strait in some parts not more than a mile in width; and from Kiu-siu by Bungo Channel, which is about 80 miles broad. North of Nipon, and separated from it by the Sangar Straits, is the large Island of Yesso, a conquest and colony of the empire. Its form is that of an irregular triangle, and its area is computed at 30,000 square miles. The southern portion of the island of Krafto, or Sagalien, which is separated from Yesso by the Strait of Pouse, and the three southernmost of the Kurile Islands—Kunashir, Iturup, and Ourup—belong to Japan.

The small islands which surround these are generally rocky and barren, but occasionally rich and fruitful. The entire number of islands composing the empire of Japan is estimated at above 1000, and the area of the whole empire at not less than 170,000 square miles. The coasts are difficult of access, not only from the multitude of rocks and islets which beset the passages, but also from the severe gales which, more than any other part of the ocean, agitate these narrow seas. Several dangerous whirlpools also occur among the rocks. Kämpfer remarks, that nature seems to have designed these islands to be a sort of little world, secluded and independent from the rest, as well by rendering it dangerous to approach their shores, as by endowing them plentifully with every thing necessary for luxury and comfort, and thus enabling them to subsist without any commerce with other nations. The Japanese policy, which rigidly

forbids all intercourse with strangers, in other circumstances impracticable, has been greatly facilitated by the interposition of these natural barriers.

Climate.—The climate of Japan must vary considerably between its northern and southern extremities; but, except at a few points, we possess very little information on the subject. In the southern part of the empire, it is said in many respects to resemble that of England. At Nagasaki, in the island of Kiu-siu, lat. 33° , the average temperature in the month of January was 35° , and in August 98° of Fahr. At this point the weather is very changeable. Rain is frequent at all seasons of the year, but especially in the months of July and August. In December and January the ground is covered with hoar frost, and occasionally with snow, except in very mild winters. In summer the land is cooled by the sea-breeze, which blows from the south during the day, and from the east at night. At Simoda, on the island of Nipon, in north lat. $34^{\circ} 39' 49''$, east long. $138^{\circ} 57' 50''$, we learn, from the account of the American expedition (1852-54), that "the climate is more or less variable in the winter and spring. The presence of snow upon the lofty peaks, although there is seldom frost or snow at Simoda itself, and the not unfrequent rains, with the ever necessary fogs, give an occasional humidity and rareness to the atmosphere, which are chilling to the senses, and must be productive of occasional inflammatory diseases, such as are frequent in the spring and winter with us. The change of wind alternates often between the warm sea-breezes from the south, and the cold blasts from the snow-capped mountains inland, and produces the usual effects, doubtless, of such variations. In summer it is occasionally very hot in the daytime, but the nights are refreshed by the sea-breezes. From April 19 to May 13, a record of the thermometer gives 72° as the highest, and 58° as the lowest point; and of the barometer, $29^{\circ} 38'$ and 30° . As the season advances the mercury rises, no doubt, much higher, reaching probably 85° of Fahr., or more." Golownin, a Russian naval officer, who was for two years a prisoner at Hakodadi in Yesso (north lat. $41^{\circ} 49'$, east long. $140^{\circ} 47'$), describes its climate as follows:—"The ponds and lakes freeze, snow lies in the valleys and plains from November till April, and falls in as great abundance as at St. Petersburg. Severe frosts are indeed uncommon, yet the temperature is often two degrees below the freezing point. In summer the rain pours in torrents at least twice a week, the horizon is obscured by dark clouds, violent winds blow, and the fog is scarcely ever dispersed. Apples, pears, and peaches hardly attain ripeness, and the orange and lemon will not bear fruit." Of the climate of the still more northern part of the empire we have no precise account; but the same writer informs us that on the coast of Sagalien, which is but little further north than Paris, the sea is not clear of ice so early as the Gulf of Finland. Fogs are also, as might be expected, very prevalent in Japan, and thunderstorms are frequent.

Surface.—The surface of the principal islands is in general very irregular, though in the interior some plains of considerable extent occur. In many places hills descend close to the sea-shore, or leave only a narrow strip of land between the water and their bases. The highest mountain is said to be Fusi, an extinct volcano, on the island of Nipon, westward of the Bay of Yeddo. Its summit is clad in perpetual snow, thus indicating a height of not less than 12,000 feet above the level of the sea. Several mountains of considerable elevation are seen to rise in the northern part of Nipon, in Yesso, and in Sagalien, and some of them are active volcanoes. Besides the outbursts of frequent volcanic eruptions, no country is more frequently visited by destructive earthquakes. Kämpfer enumerates six active volcanic mountains. "Earthquakes," says he, "are so frequent that the natives

regard them no more than Europeans do ordinary storms." In 1586 a succession of earthquakes took place and lasted for 40 days, causing the destruction of the best part of the city of Yeddo, and the death, it is alleged, of 200,000 of its inhabitants. In 1783 the eruption of a volcano in the island of Kiu-siu, accompanied by violent earthquakes, destroyed in a single province 27 villages. Another volcanic eruption took place in the same island in 1793, accompanied by earthquakes which continued from March to June, and caused, according to official returns, the death of 53,000 persons, with a proportional destruction of property. On 23d December, 1854, an earthquake occurred which was felt on the whole coast. Of the town of Simoda only a few temples and private edifices, that stood on elevated spots, escaped destruction. The fine city of Osaca, on the south-eastern side of Nipon, was completely destroyed, and the capital Yeddo did not escape without injury. On 10th November, 1855, an earthquake at Yeddo is said to have caused the destruction of 100,000 dwellings and 54 temples, and the death of 30,000 persons.

Rivers.—The rivers are numerous, but short, shallow, and rapid. They are not navigable for vessels of burden, but some of them may be ascended by small boats for some miles from the sea. The principal lake of Japan is that of Oitz, in the southern part of the island of Nipon. It is about 60 miles in length, but of inconsiderable breadth.

Geology.—Little is at present known of the geological formation of the Japanese islands. The volcanic formation appears to prevail, but by no means to the exclusion of the plutonic and sedimentary. The useful mineral products, so far as yet known, are gold, silver, copper, quicksilver, tin, lead, iron, coal, sulphur, and salt. With the exception of tin and iron, these seem to be all very abundant. The gold is found in many parts of the empire, sometimes as ore, and sometimes from the washings of the earth or sand. Silver is equally plentiful with gold, and it is probable that the quantity of these metals annually exported from the country, when the trade was open, amounted in value to a million and a half sterling. Copper abounds through the whole group, and sometimes of a quality not to be surpassed by any in the world. The natives refine it, and cast it into cylinders about a foot long and an inch thick. A specimen analyzed by Dr. Percy gave 0.13 per cent. of nickel, 0.03 per cent. of iron, and extremely minute traces of tin and gold. The coarser kinds they cast into round lumps or cakes. Iron ore rich enough for the purpose of smelting appears to be confined to three provinces, and the metal is consequently dear. "Iron," says Kämpfer, "is much of a price with copper, iron tools being full as dear, or rather dearer, than those of copper or brass." The same is stated with respect to the proportional value of iron and copper by Golownin. Lead and quicksilver are said to be abundant, but they have never been articles of export. Tin has been discovered in small quantities, and of a quality so fine and white that it almost equals silver; but of the extent to which it may be procured little is known, as the Japanese do not attach much value to it. Zinc, according to Kämpfer, is not produced in Japan, and in his time calamine used to be imported from Tonquin for the manufacture of brass wares. Zinc, however, is expressly stated by the governor-general Baron Van Imhoff to be an article of export as well as brass. This was 50 years after Kämpfer's time. Sulphur, as might be expected in a region so volcanic, is very abundant. In some places it lies in broad deep beds, and may be dug up and removed with as much ease as sand. A considerable revenue is derived by the government from this source. Coal appears to be found in many parts of the country, and is used for fuel. Siebold speaks of it as being in common use throughout the country, and on visiting one of the mines he

saw enough to convince him that it was skilfully worked. Being bituminous, it is, for domestic purposes, generally converted into coke. Rock-salt seems to exist in some parts of the country, but does not appear to be much used, the culinary salt in use being made from sea-water by an unskillful and expensive process. By saturating masses of sand with sea-water in the sun, a strong lye is obtained, which is afterward boiled in earthen vessels, and yields an expensive and impure muriate of soda. No diamonds have been found, but agates, carnelians, and jaspers are met with, some of them of great beauty. Pearls, frequently of great size and beauty, are fished up on nearly all parts of the coast.

Vegetable Productions.—The vegetable productions of Japan are, for the most part, those common to temperate regions. Timber is, however, so scarce, that no one is permitted to cut down a tree without permission from the magistrate, and only on condition of planting a young one in its stead. The most common forest trees are the fir and cedar—the latter growing to an immense size, being sometimes more than 18 feet in diameter. In the northern parts of the empire two species of oak are found which differ from those of Europe. The acorns of one kind are boiled and eaten for food, and are said to be both palatable and nutritious. The mulberry grows wild in great abundance, and the varnish-tree (*rhus vernic*) abounds in many districts. In the south, the bamboo cane, though a tropical plant, is found either in the wild or cultivated state, and is largely used in the manufactures. The camphor-tree is of great value here, and lives to a great age. Siebold visited one which Kempter had described as having been seen by him 185 years before. It was healthy, and covered with foliage, and had a circumference of 50 feet. The country people make the camphor from a decoction of the root and stems cut into small pieces. Chestnut and walnut trees are both found. Among the fruit trees are the orange, lemon, fig, plum, cherry, and apricot.

Animals.—Extensive cultivation leaves no room for wild animals; and tame animals, not being used for food, are not multiplied beyond the felt necessity for their use. The horses are small, but hardy, active, and of good bottom. William Adams, an English mariner of the time of James I., describes them as "not tall, but of the size of our middling nags, short and well trust, small headed and very full of mettle, in my opinion far excelling the Spanish jennet in pride and stomach." Oxen and cows are only used in plowing and carriage, milk and butter not being used as articles of food. Buffaloes of an extraordinary size, with hunches on their backs, like camels, are used to draw carts and carry heavy goods on their backs. Sheep and goats were formerly kept at Firando by the Dutch and Portuguese, and might be bred in the country to great advantage if the natives were permitted to eat their flesh, or knew how to manufacture their wool. They have a few swine, kept chiefly for trading with the Chinese, among whom they are in great demand. Dogs are to be found in large numbers in the half domesticated state in which they generally exist in the East. This is not true, however, of one species, resembling somewhat an English spaniel, which is considered so valuable as to form part of every royal Japanese present. It is conjectured that the English variety may have sprung from some presented by the emperor to the king of England. The wild animals are bears, wild boars, foxes, monkeys, deer and hares. Rats and mice are very common, as well as two small species of weasel or ichneumon, which live, half tame, under the eaves of houses.

Wild fowl are very abundant, consisting chiefly of geese and ducks, which migrate in great numbers to the shores of Japan in winter. Numerous species of pigeons are to be found, and woodcocks, pheasants, snipes, larks, etc., are common. There are two spe-

cies of pheasant, and one of peacock, peculiar to Japan. Domestic poultry are kept by the natives almost solely for ornament or amusement. Some of the reptilia are of large size, and, along with the insect tribes, are dreaded for their deadly and destructive powers.

The shallow bays and creeks around the islands swarm with shoals of fish, which, indeed, constitute nearly the whole animal food of the Japanese, and furnish them plentifully with oil for domestic purposes. In their coarse taste, the intestines of the whale, and even the refuse of blubber, are considered good enough for food. The Japanese are the boldest and most expert of all Asiatic fishermen. Their fishing voyages extend to the rigorous seas of Sagalien and Kuriles in pursuit of herring, with which they manure their cotton fields. They are the only Asiatic people that pursue the whale. The women are said to be expert divers for shell-fish, with which the shores of Japan abound.

Natives.—The Japanese are described as an active, vigorous people, of the middling size, and their bodily and mental powers more closely assimilated to Europeans than Asiatics. The common people, according to Thunberg, are of a yellow color, which sometimes borders on brown, and sometimes on white. The laboring classes, from the exposure of the upper parts of their bodies in summer, have their naturally fair complexion deepened into brown. Their dark brown eyes are oblong, small, and sunk deep in the head. The eyelids forming a deep furrow gives them the appearance of being keen-sighted. Their heads are large, and their necks short, their hair black and glossy with oil. Their noses, without being flat, are yet rather thick and short. Dr. Ainslie gives a somewhat different account of their complexion. He represents them as perfectly fair, and indeed blooming, though this seems to apply chiefly to the women. Thunberg also mentions that the descendants of the oldest and noblest families of the princes and lords of the empire are somewhat majestic in their shape and countenance, being more like Europeans; and the ladies of distinction, who seldom go out in the open air without being covered, are perfectly white. Siebold, speaking of the inhabitants of Kiu-siu, corroborates this view, and says that "the women who protected themselves from the influence of the atmosphere have generally a fine and white skin, and the cheeks of the young girls display a blooming carnation." The married women of Japan dye their teeth black, by means of a corrosive composition, so powerful that by mere touch it burns the flesh into a purple gangrenous spot, and in spite of the utmost care in its application, invariably taints the gums, destroying their ruddy color and vitality. "The Japanese women, always excepting the disgusting black teeth of those who are married, are not ill-looking. The young girls are well formed, and rather pretty, and have much of that vivacity and self-reliance in manners which come from a consciousness of dignity, derived from the comparatively high regard in which they are held. In the ordinary mutual intercourse of friends and families the women have their share, and rounds of visiting and tea-parties are kept up as briskly in Japan as in the United States."—*American Expedition.*

Language.—Superficial observation led to the belief that Japan was colonized by the Chinese; but a more accurate knowledge of the physical characteristics and language of the people has rendered this opinion untenable. Indeed, the Japanese themselves consider it a high disgrace to be compared with the Chinese. Dr. Ainslie states that the only occasion on which he saw a Japanese surprised into a passion, and, forgetting his habitual politeness, lay his hand on his sword, was on a comparison being made between the two nations. The structure of the languages of the two countries is essentially different, that of Japan being polysyllabic, while all the dialects of the Chinese are monosyllabic.

It is true that, like the Latin in Europe during the middle ages, the mandarin dialect of the Chinese is in use among the learned here, as in Corea, Tonquin, and elsewhere; and hence many Chinese words have been introduced into the Japanese; but the introduction of these only makes the structural difference the more strikingly apparent. The *Yomi*, or primitive language of Japan, is used in poetry and works of light literature. The *Koye*, or Chinese language, slightly varied in pronunciation, is employed by the *bonzes* or priests in their religious books. The vulgar language of the country is a mixture of the two. Close affinities have not been traced between the *Yomi* of Japan and any other Asiatic language. By some, at least, it is thought to be most analogous to the languages of the Tartar race, to which, in spite of diversity in physical characteristics, it is now most commonly believed that the Japanese belong.

Population.—In regard to the population of Japan, all our information rests merely on conjecture. Some authorities estimate it at more than 10,000,000, while others make it more than four or five times that amount. All travelers who have visited the country bear testimony to the populousness of the parts visited by them. Thus, Kämpfer, who passed four times over that part of the country between Nagasaki and Yeddo, says—"The country is populous beyond expression, and one would scarce think it possible that, being not greater than it is, it should nevertheless maintain and support such a vast number of inhabitants. The highways are an almost continued row of villages and burghs. You scarce come out of one but you enter another; and you may travel many miles, as it were, in one street without knowing it to be composed of different villages but by the different names that were formerly given them, and which they afterward retain though joined to one another. It has many towns, the chief whereof may vie with the most considerable in the world for largeness, magnificence, and the number of inhabitants."

The men of all classes are exceedingly courteous, and although inquisitive about strangers, never become offensively intrusive. The lower people are evidently in great dread of their superiors, and are more reserved in their presence than they would be if they were left to their natural instincts. The rigid exclusiveness in regard to foreigners is a law merely enacted by the government from motives of policy, and not a sentiment of the Japanese people. Their habits are social among themselves, and they frequently intermingle in friendly intercourse. "The Japanese," says Kämpfer, "are very industrious and inured to hardships. Very little will satisfy them. They generally live on plants and roots, tortoises, shell-fish, sea-weeds, and the like. Water is their common drink. They go bare-headed and bare-legged. They wear no shirts; they have no soft pillows to lay their heads on, but sleep on the ground, laying their heads, instead of a pillow, on a piece of wood, or a wooden box somewhat depressed in the middle. They can pass whole nights without sleeping, and suffer all manner of hardships." The following apparently very correct picture of this people is given by an anonymous writer of the reign of Elizabeth: "The inhabitants show a notable wit and an incredible patience in suffering, labor, and sorrows. They take great and diligent care lest either in word or deed they should show their fear or dullness of mind, and lest they should make any man (whosoever he be) partaker of their troubles and wants. They covet exceedingly honor and praise; and poverty with them bringeth no damage to nobility of birth. They suffer not the least injury in the world to pass unrevenged. For gravity and courtesy they give not place to the Spaniards. They are generally affable and full of compliments. They are very punctual in the entertainment of strangers, of whom they will curiously inquire even trifles of foreign people, as

of their manners, and such like things. They will as soon lose a limb as omit one ceremony in welcoming a friend. They used to give and receive the cup at one and the other's hands, and before the master of the house begins to drink, he will proffer the cup to every one of his guests, making show to have them begin. Fish, roots, and rice are their common junkets; and if they chance to kill a hen, duck, or pig, which is but seldom, they will not, like churls, eat it alone, but their friends will be partakers of it. Although essentially an abstemious and sober people, they are not averse occasionally to strong potations."

The Japanese laws are very short and intelligible, and the proceedings under them are as simple as the laws themselves. There are no professional lawyers, every man being deemed competent to plead his own cause. If a party is aggrieved, he appeals to the magistrate, who summons the other party before him. The case is then stated by the complainant in his own way, and the accused is heard in reply. The magistrate examines witnesses, and is said frequently to display great acuteness in the detection of falsehood. He passes sentence, from which there is no appeal, and it is carried into execution *instantly*. If the matter in dispute be of great importance, the magistrate may refer it to the emperor in council. Sometimes in trifling cases he orders the parties to go and settle the matter privately with the aid of their friends, and it is well understood that the matter must be settled, or unpleasant consequences will result. See *Ency. Brit.*, 1856; De Bow's *Review*, ix.

Revenue.—The great source of revenue in Japan is the rent of land, with an impost on houses, in the manner of a ground rent. There appears to be no tax on articles of consumption, no capitation tax, and no transit duties. The cultivators of the soil appear to be mere villeins, simply occupants cultivating as metayers. In lands belonging to the crown, the proportion of the crop considered rent is four parts in ten, and in the rest six in ten, most commonly the latter. These proportions apply to every kind of crop—corn, pulses, and cotton. The land, in order to determine the rent, is surveyed by sworn appraisers twice a year, once before the seed is sown, and again immediately before harvest. Those that cultivate untilled ground have the whole crop for two or three years. Among their many excellent laws relating to agriculture, one is, that whosoever does not cultivate his ground for the term of one year forfeits his possession. It would appear, from the proportion of crop taken as rent, that the impost on the land does not materially differ from that assumed as land-tax under the Mohammedan government of Hindoostan, and continued in some places by ourselves. This will enable us to make an approximate estimate of the rental of Japan—that is, of the principal source of its public income. This, of course, will suppose a similar condition of society and rate of population in Japan and the country with which it is compared. Let us take, therefore, the same Indian territories by which we have attempted to estimate the population. These have, in round numbers, a population of 46,000,000, and yield a land-tax of £10,000,000. This proportion would give to Japan, with its estimated population of 40,000,000, a rental of nearly £8,700,000 to be divided between the imperial governments, feudatory princes, hereditary nobles, and the soldiery.

To the rent of lands is to be added the ground-rent of the houses, which is said to be at the rate of 1s. 8d. for each fathom of frontage, without regard to depth, unless it exceed 15 fathoms, when the rate is doubled. Whether the impost applies to all houses, wherever situated, or only to those in towns, is not stated; but if the former be the case, estimating each house to have an average of five inhabitants, and also five fathoms of frontage, would give the income from this source at more than £3,300,000, or, adding this to the land-rent,

would make the annual revenue of the empire about £12,000,000.

The Japanese being chiefly dependent on the soil for subsistence, have arrived at a high state of perfection in the arts of agriculture. Though a great part of the country is hilly or mountainous, and the soil in general rather poor, yet almost every available foot of land is cultivated, and very abundant crops are raised. Where the land is inaccessible to the plow it is cultivated by manual labor. Like the Chinese, they pay great attention to manuring and irrigation. As animal food constitutes hardly any part of their subsistence, no pastures or meadows are to be seen. Rice constitutes the main object of agriculture, as it forms the bread corn of the people from one end of the empire to the other. Its cultivation extends to the island of Yesso, and as far north as 45 degrees of latitude. The rice of Japan is known to excel every other in Asia, and this may not be owing exclusively to its skillful cultivation, but partly to the climate and the distance of Japan from the tropics. From it the inhabitants distill a drink called *saki* (a kind of rice beer), in very general use. Wheat and barley are grown, but the former is not in much use, and the latter is the chief provender of cattle. Rye, maize, panic, millet, and the *Cynosu-rus cororanus* are also raised. Beans and peas of different kinds are cultivated in great abundance, particularly the bean *Dolichos soja*, from which *soy*, a kind of sauce, prepared by boiling and fermentation, is made. Among esculent roots and pot-herbs the following are successfully cultivated: the bata, the potato, carrot, turnip, cabbage, radish, lettuce, gourd, melon, and cucumber. The fruits are generally those of Europe, as the orange, lemon, peach, fig, pear, chestnut, walnut, and cherry.

The tea-plant in Japan, as in China, takes the place of the vine in the temperate regions of the west, and of the coffee in tropical countries. "The tea shrub," says Kämpfer, "is one of the most useful plants growing in Japan, and yet it is allowed no other room but round the borders of rice and corn fields, and in other barren places unfit for the culture of other things." In a few places the plant, according to Siebold, receives more attention; generally, however, hardly as much as our hawthorn hedges, and thus the leaves are unfit for the consumption of strangers. Its use, however, is universal among the natives. It was introduced into this country from China in the ninth century. Tobacco was first introduced by the Portuguese in the early part of the 16th century, about the same time that it was introduced into England, and it is remarkable that the Japanese emperor instituted a persecution against its growers and smokers at the same time that King James issued his *Counter Blast*, and with as little effect in arresting its use. The plants cultivated in Japan for textile purposes are cotton and hemp in the northern islands. The mulberry is grown for the silk-worm. In husbandry cotton ranks next in importance to rice, and furnishes materials for clothing the great mass of the people.

Manufactures.—In the manufacture of cotton fabrics the Japanese display considerable skill, but in this respect they do not equal the Hindoos. Their best silk is said to be superior to that of China. In the manufacture of porcelain, too, they are said by some to excel the Chinese. Specimens of great beauty and delicacy, at least, have been produced, though some assert that, owing to the exhaustion of the best clay, such articles can no longer be manufactured. Like the Chinese the Japanese have long practiced the manufacture of paper and glass. Formerly they did not know how to make the flat pane for window glass, and probably what they do make is of an inferior quality, as they still purchase thick mirror glass from the Dutch, to grind into lenses. Paper they manufacture in great abundance, as well for writing and printing as for tapestry, handkerchiefs, etc. It is made of very

various qualities, and some of it is as soft and flexible as cotton cloth. Indeed, that used for handkerchiefs might be mistaken for cloth, so far as toughness and flexibility are concerned. This paper is made of the bark of the mulberry (*Morus papyrifera*) by means of the following process: In December after the tree has shed its leaves, they cut off the young shoots, about three feet in length, and tie them up in bundles. They are then boiled in a lye of ashes in a covered kettle, till the bark is so shrunk that half an inch of the wood may be seen projecting at either end of the branch. When cool the bark is stripped off, and soaked in water for three or four hours until it becomes soft, when the exterior black cuticle is scraped off with a knife. The coarse bark, which is full a year old, is then separated from the fine, which covered the younger branches, and which makes the best paper. The bark is then boiled again in clear lye, continually stirred with a stick, and fresh lye from time to time added, to make up for the evaporation. It is then carefully washed at a running stream, by means of a sieve, and incessantly stirred until it becomes a fine pulp. For the finer kinds of paper this process is repeated, a piece of linen being substituted for the sieve. After being washed, it is beaten with sticks of hard wood on a wooden table, till it is brought to a pulp, which is put into water and dissolved and dispersed like meal. This is put into a small vessel with a decoction of rice and a species of *Hibiscus*, and stirred until it has attained a tolerable consistence. It is then poured into a larger vessel, whence it is taken out, and put in the form of sheets in mats or layers of grass straw. These sheets are laid one upon another, with straw between, and pressure is applied to force the water out. After this they are spread upon boards in the sun, dried, cut, and gathered into bundles for sale and use. The well-known lacquer ware to which Japan has given name, is unequalled for beauty and durability by that of any other nation. We have ourselves of late years imitated, but certainly not equalled it. They display considerable skill in working the metals. In wood work, caskets, cabinets, and the like, they are unsurpassed. Some of their swords are said to be equal to the finest Damascus blades; and Golownin states that their carpenters' and cabinet-makers' tools are equal in temper to those of a similar kind in England. They are exceeding quick in observing any improvement brought in among them by foreigners, and copy it with great skill and exactness. Clocks, watches, and astronomical instruments are made by them, copied from European models.

Arts.—In certain branches of the fine arts the Japanese have attained no small skill. They are ignorant of anatomy and perspective, and therefore barbarous in their sculptures and landscapes; but in the representation of a single object they manifest great accuracy of detail, and a truthful adherence to nature. Architecture, as an art, can hardly be said to have an existence—their temples, palaces, and private houses being all low and temporary structures, generally of wood; and the frequency of earthquakes leads them to bestow less care on their buildings than in other circumstances they might do.

Trade.—The Japanese carry on a large internal traffic, which, from the peculiar characteristics of their country, is in a great measure by coasting. The numerous straits and creeks, with their shallow waters, though generally unfit for ships of burden, are sufficiently commodious for the small craft of the Japanese, which rarely exceed 60 tons burden. The inland transport is by horses, oxen, and porters, there being very little river or canal navigation. Kämpfer, who, however, refers to the busiest parts of the country, that between the chief port Osaco and the two capitals, speaks of its commercial activity as follows: "How much is carried on between the several provinces of the empire! How busy and industrious the

merchants are everywhere! How full their ports of ships! How many rich and mercantile towns up and down the country! There are such multitudes of people along the coasts and near the sea-ports; such a noise of oars and sails and numbers of ships and boats, both for use and pleasure, that one would be apt to imagine the whole nation had settled there, and all the inland parts were left quite desert and empty." This was said 160 years ago, and it may be safely assumed that the uninterrupted peace which the country has since enjoyed has not impaired its commercial prosperity. That the Japanese are a commercial people may be inferred from the order, neatness, and propriety with which every thing connected with their trade is conducted. They have gold, silver, and copper money, as well as bills of exchange. Their shops have signs, and their goods are packed and labeled with a truly mercantile care and neatness.

The foreign intercourse of Japan was, more than two centuries, and till within the last few years, solely confined to the Dutch and Chinese. Even with these the trade was limited, being with the Dutch for a considerable time restricted to a single ship annually, and with the Chinese to ten junks. The exports and imports were even limited as to value, and the sales and purchases fixed by a tariff of the Japanese government. The Dutch were confined to the small island of Desima, in the harbor of Nagasaki, which is only about 640 feet in length by 240 in extreme breadth. A small stone bridge connects the island with the town of Nagasaki, and a strong Japanese guard was always stationed here, no one being allowed to pass either to or from the island without license. The whole island is surrounded with a high fence, on the top of which are placed iron spikes. On the north side are two water-gates, which were kept always shut, except to admit or let out the Dutch vessels. When a ship arrived her guns and ammunition were first taken out, and she was afterward searched in every part, and an exact list made of every thing on board. The crew were then permitted to land on the island, where they were kept, as long as the ship remained, under the inspection of guards. Every Japanese official at the Dutch factory was bound twice or thrice a year to take a solemn oath of renunciation and hatred of the Christian religion, and was made to trample crosses and crucifixes under his feet. The Dutch were at all times surrounded by Japanese spies, whom they were obliged to employ as interpreters, clerks, servants, etc.

As the empire is again in some measure thrown open to foreign intercourse, it may not be unprofitable to speculate on the nature and value of a trade with it. The commodities which have been chiefly in demand in Japan, are iron, steel, lead, tin, quicksilver, cinnabar, sapan-wood, black pepper, cloves, nutmegs, sugar, putchuk, deer-skins, ivory, Chinese and Tonquin raw silk, Indian cotton goods, cotton yarn, mirrors and other glass ware, and English woollens. At one time or another all these articles found a market in Japan, and most of them are imported by the Dutch and Chinese at the present time. In a free trade, or any approach to it, with Japan, we may suppose that iron and steel, high-priced commodities there, would become staple imports. The climate would give rise to a consumption of woollens; and although the Japanese are clothed in their own cotton, judging from what has taken place in India, where both the raw and wrought articles are cheaper than in Japan, we may infer that cotton fabrics might be imported with advantage. Cotton yarn or twist has long been one of the regular articles of import, although it was long the high-priced manufacture of Java spun with the distaff that was imported. Mirrors and glass ware would, no doubt, find a ready market. Sugar would certainly be in demand, as Japan produces none; and the same may be said of nearly all kinds of spices and dyes.

woods. Even cotton wool and rice might be occasionally imported, as they are regularly into China. According to M. Caron, whose information refers to 1636, or the period preceding the last persecution, the European nations imported annually into Japan from 540,000 to 675,000 lbs. of Chinese raw silk, 200,000 deer-skins, and 100,000 other kinds of peltry.

With respect to the exchangeable products from Japan, gold, silver, and copper were largely exported when the trade was open. While the Dutch were carrying on their trade at Firando, and still unrestricted, they exported annually gold to the value of £170,000, and silver to from £330,000 to £385,000. But the Spanish and Portuguese trade was free at the same time, and these nations are stated to have exported more largely, so that we may conclude that a million and a half of the precious metals were, from near the beginning to near the middle of the 17th century, exported from Japan. Of copper, the Dutch exported in some years as much as 1800 tons. Most important, however, in this part of the world will be the supply of coal, which the islands are said to furnish abundantly. It will also be seen from what we have already said of the productions of the country, that there are many things among them that may become valuable as exports, while a demand for other articles will no doubt lead to their introduction as subjects of trade.

After the expulsion of the Portuguese in 1639, and before the restrictions were so stringent as they afterward became, the entire value of the foreign trade was estimated by the Dutch governor-general, the Baron Van Imhoff, at £333,000; while in his own time (1744) it had declined to £264,583, of which one third only was Dutch, the rest being Chinese. In 1805 the cargoes of two ships laid in at Batavia, were sold in Japan for £35,416, with which, or rather with the balance after deducting heavy local charges, copper and camphor were purchased, which in Batavia sold for £195,733. The adventure of next year was neither so large nor so prosperous, for the outward cargo brought in Japan only £24,325, and the return cargo of copper and camphor produced when sold in Batavia only £101,644. These favorable speculations however, arose entirely from the enormous war prices for copper and camphor. Since then the trade has become still smaller, and, as already stated, is confined to a single ship. In the earlier period of its trade Japan was not only free to all the world, but was not even burdened with imposts on either ship or cargo; presents, however, required to be made to the emperor, the provincial governors, and one or two other parties.—E. B.

Money.—Accounts are kept in taels, mace, and candarines; 10 candarines make 1 mace, and 10 maces 1 tael. The Dutch reckon the Nangasaki tael at $3\frac{1}{2}$ florins, equal to about 6s. 2d. The gold coins current are the new and old itjib and cobangs, or copangs; the silver coins are, the nandiogin, itaganne, and kodama. They are in general very simple, struck plain and unadorned, the greatest part of them without any rim round the margin, and most of them without any determined value. For this reason they are always weighed by the merchants, who put their chop or stamp upon them, to signify that the coin is standard weight and unadulterated. The new cobangs are oblong, rounded at the ends and flat, about 2 inches broad, scarcely thicker than an English farthing, of a pale yellow color; the die on one side consists of several cross lines stamped; and at both ends there is a rectangular figure, with raised letters on it, and, besides, a moonlike figure, with a flower on it in relief. On the other side is a circular stamp, with raised letters on it; and within the margin, toward one end, two smaller sunk stamps with raised letters, which are different on each cobang; they are valued at 60 mace.

There are old cobangs occasionally met with, which are of fine gold, somewhat broader than the new. The old cobang weigh 371 Dutch asen, or 275 English grains, and the gold is said to be 22 carats fine, which would give 44s. 7d. for the value of the old cobang. But the Japanese coins are reckoned at Madras only 87 touch, which is 20, 22, 25 carats; this reduces the old cobang to 41s. 10d. The new cobang weigh 180 grains; the gold is about 16 carats fine, and the value 21s. 8d. The oban is thrice the value of the cobang. The itjib is called by the Dutch golden bean, and is made of pale gold, of a parallelogramical figure, and flat, rather thicker than a farthing, with many raised letters on one side, and two figures or flowers in relief on the other; the value of this is half of a cobang. There are old itjibs also to be met with; these are thicker than the new ones, and in value 22 mace 5 candarines. Nandiogin is a parallelogramical flat silver coin, of twice the thickness of a halfpenny, 1 inch long and $\frac{1}{2}$ inch broad, and formed of fine silver. The edge is stamped with stars, and within the edges are raised dots. One side is marked all over with raised letters; and the other on its lower and larger moiety, is filled with raised letters, and at the same time exhibits a double moonlike figure. Its value is 7 mace 5 candarines.

Itaganne and kodama are denominations by which various lumps of silver, without form or fashion, are known, which are neither of the same size, shape, nor value. The former of these, however, are oblong, and the latter roundish, for the most part thick, but sometimes, though seldom, flat. These pass in trade, but are always weighed in payment from one individual to another, and have a dull leaden appearance. Seni is a denomination applied to pieces of copper, brass, and iron coin, which bear a near resemblance to our old farthings. They differ in size, value, and external appearance, but are always cast, and have a square hole in the middle, by means of which they may be strung together; and likewise have always broad edges. Of these are current, sjumon seni, of the value of 4 common seni, made of brass, and almost as broad as a halfpenny, but thin. The common seni are the size of a farthing, and made of red copper; 60 of them = 1 mace. Doosa seni is a cast iron coin, in appearance like the last, of the same size and value, but is so brittle that it is easily broken by the hand, or breaks in pieces when let fall on the ground. The seni are strung 100 at a time, or as is most commonly the case, 96 on a rush. The coins in one of these parcels are seldom all of one sort, but generally consist of 2, 3, or more different kinds; in this case, the larger ones are strung on first, and then follow the smaller; the number diminishing in proportion to the number of large pieces in the parcel, which are of greater value than the smaller. The schuit is a silver piece of 4 oz. 18 dwts. 16 grs. Troy, and is 11 oz. fine, which gives it value £1 5s. 3d. The name is Dutch, referring, probably, to its shape, like a boat.

Weights.—These are the candarine, mace, tael, catty, and picul, thus divided:

10 candarines	=	1 mace.
10 mace	=	1 tael.
16 taels	=	1 catty.
100 catties	=	1 picul.

The picul = 125 Dutch lbs., or 133½ lbs. avoirdupois. It is, however, said to weigh only 130 lbs.

Measures.—The revenues of Japan are estimated by two measures of rice, the man and koif; the former contains 10,000 koifs, each 8000 bales or bags of rice. The long measure is the inc, which is about 4 Chinese cubits, or 6½ feet English nearly; and 2½ Japanese leagues are computed to be about 1 Dutch league.—*MILBURN'S Orient. Com.*

The principal, or more important towns of the empire, are Yedo (or Jeddo), Mijako (or Kio), etc.; Nangaski, Saga, Kokura, etc.; Simoda, Kotsi, Takamutsi, etc.; Hakodade, Matsumae, etc.

Commercial Intercourse.—At an early period the Portuguese founded a settlement, and established trade with the Japanese, having succeeded in winning the favor of several of the native princes, through the instrumentality mainly of Christian missionaries. In 1642, Fernando Mendez Pinto, a Portuguese, embarked in a junk from Macao to Lew-Chew; but encountering adverse winds, he was driven to one of the western islands of the Japanese archipelago. About the same period, the celebrated Xavier arrived at Goa, and, proceeding soon after to Koyosima, made so favorable an impression on the Prince of Satsuma that an active and profitable intercourse at once sprung up between the western ports of Japan and Macao. This intercourse continued uninterrupted during a period of nearly 40 years, when an edict was issued permitting the Portuguese to continue their trade as before, but forbidding them to bring any more missionaries, or even to speak on religious subjects. In 1635, under the reign of Yeye Mitson, a prison was constructed off Nangasaki, and all the Portuguese found in the country were there confined, and the commercial privileges which they had so long enjoyed were transferred to the Dutch, who were generally believed to be the instigators of the severe measures put in force against the Portuguese. A sanguinary battle between the Portuguese and native Christians, amounting to 38,000 men, on the one side, and the Dutch, and such of the natives as sympathized with them in their hostility to the Portuguese, on the other, was the result of these rigorous measures. The former fortified themselves in Simabara, and the latter made their attack under the command of the Dutch director Kockebecke. The fortress was soon reduced, and the Portuguese, rather than submit to their rivals, to whom they attributed all the misfortunes that had befallen them, perished to a man. An edict was immediately published, forbidding the Portuguese to enter the country. The intelligence of these proceedings soon reached Macao, and four of the most distinguished citizens were sent to conciliate the favor of the government of Japan. They arrived at Nangasaki in 1640, and were immediately put under arrest, and condemned to death for entering the country in violation of the edict. The following inscription, written, it is said, by the Dutch director, Kockebecke, was placed on their grave: "So long as the sun shall warm the earth, let no Christians be so bold as to come to Japan; and let all know, that the King of Spain himself, or the Christian God, or the Great Saca, if he violate this command, shall pay for it with his head." The Portuguese have never since been permitted to renew their intercourse with Japan.

The first formal edict in favor of the Dutch was issued in 1611, and the privileges of trade which were then conceded have continued, modified at various times, to the present day. In the earlier period of this trade, return cargoes consisted chiefly of silver and gold, Japanese copper being then but little known in Europe. This latter article, however, soon became one of the leading staples of Japanese export trade. In a work, entitled "Notes of the Voyage of the Morrison from Canton to Japan," published in 1839, the following reference to the Dutch trade at this period is made: "The Dutch were now left in sole possession of the trade with Japan; and, since that time, it is well known, their monopoly has never been disturbed. Their subsequent political intercourse has been limited to an occasional mission from Batavia, and the visits of the Dutch chief of the factory to Yedo, formerly made annually but now once in four years. Charlevoix mentions embassies in 1664, 1656, and 1659. It was while the second of these missions was at Yedo, that two thirds of that city and 100,000 of its population were destroyed by fire. It remains to trace, briefly, the use the Dutch have made of the monopoly to which they have so long aspired. Of the assortment

and value of their import cargoes, in the 17th century, we have little or no account. Their returns had been in silver, chiefly, until 1641, when the directors of the Company suggested returns in gold. Japanese copper was at this time in little estimation in Europe, because little known; but afterward, on a rise in value, it became an important return. The first order for 20,000 piculs was sent out in 1655."

Various restrictions and prohibitions have been, from time to time, imposed upon Dutch commerce by the Japanese authorities. The imports and exports were limited, and the number of vessels was finally restricted to four, three, and two, as before the late treaty. The profits realized by the Dutch from this trade have never been accurately ascertained. The author already cited, referring to the restrictions imposed by the Japanese government, remarks: "Under these circumstances, the trade, which had yielded an annual profit of 500,000 to 600,000 florins for the 30 years previous [to 1714], would no longer pay the charges." Efforts have been made, at different periods, by the English and French governments, as well as by that of the United States, to open commercial intercourse with Japan; but, with the exception of the very limited concessions granted by the treaty of 31st March, 1854, between the United States and Japan, and concessions nearly similar allowed to the British, by treaty, subsequently ratified, and the privileges granted to the Dutch by the treaty of 1855, without success. Some years since, Russia endeavored to establish commercial relations with Japan; but the proposal was declined, and the envoys were ordered not to return again on pain of death.

The treaty, already referred to, between the United States and Japan, which was concluded March 31, 1854, ratified August 7, 1854, exchanged February 21, 1855, and proclaimed June 22, 1855, is as follows: "The United States of America and the empire of Japan, desiring to establish firm, lasting, and sincere friendship between the two nations, have resolved to fix, in a manner clear and positive, by means of a treaty or general convention of peace and amity, the rules which shall in future be mutually observed in the intercourse of their respective countries; for which most desirable object the President of the United States has conferred full powers on his commissioner, Matthew Galbraith Perry, special ambassador of the United States to Japan, and the august Sovereign of Japan has given similar full powers to his commissioners, Hayashi, Daigaku-no-kami, Ido, prince of Tsus-Sima, Izawa, prince of Mima-saki, and Udono, member of the board of revenue. And the said commissioners, after having exchanged their said full powers, and duly considered the premises, have agreed to the following articles: Article I. There shall be a perfect, permanent, and universal peace and a sincere and cordial amity between the United States of America on the one part, and the empire of Japan on the other part, and between their people respectively, without exception of persons or places. Article II. The port of Simoda, in the principality of Idzu, and the port of Hakodade, in the principality of Matsumai, are granted by the Japanese as ports for the reception of American ships, where they can be supplied with wood, water, provisions, and coal, and other articles their necessities may require, as far as the Japanese have them. The time for opening the first-named port is immediately on signing this treaty; the last-named port is to be opened immediately after the same day in the ensuing Japanese year. [Note.—A tariff of prices shall be given by the Japanese officers of the things which they can furnish, payment for which shall be made in gold and silver coin.] Article III.—Whenever ships of the United States are thrown or wrecked on the coast of Japan, the Japanese vessels will assist them, and carry their crews to Simoda, or Hakodade, and hand them over to their coun-

trymen appointed to receive them; whatever articles the shipwrecked men may have preserved shall likewise be restored, and the expenses incurred in the rescue and support of Americans and Japanese who may be thus thrown upon the shores of either nation, are not to be refunded. Article IV.—Those shipwrecked persons and other citizens of the United States shall be free as in other countries, and not subjected to confinement, but shall be amenable to just laws. Article V.—Shipwrecked men and other citizens of the United States, temporarily living at Simoda and Hakodade, shall not be subject to such restrictions and confinement as the Dutch and Chinese are at Nagasaki, but shall be free at Simoda to go where they please within the limits of seven Japanese miles (or *ri*) from a small island in the harbor of Simoda, marked on the accompanying chart hereto appended; and shall in like manner be free to go where they please at Hakodade, within the limits to be defined after the visit of the United States' squadron at that place. Article VI.—If there be any other kind of goods wanted, or any business which shall require to be arranged, there shall be careful deliberation between the parties in order to settle such matters. Article VII.—It is agreed that ships of the United States resorting to the ports open to them shall be permitted to exchange gold and silver coin and articles of goods for other articles of goods, under such regulations as shall be temporarily established by the Japanese government for that purpose. It is stipulated, however, that the ships of the United States shall be permitted to carry away whatever articles they are unwilling to exchange. Article VIII.—Wood, water, provisions, coal, and goods required, shall only be procured through the agency of Japanese officers appointed for that purpose, and in no other manner. Article IX.—It is agreed that if at any future day the government of Japan shall grant to any other nation or nations, privileges and advantages which are not herein granted to the United States and the citizens thereof, that these same privileges and advantages shall be granted likewise to the United States and to the citizens thereof, without any consultation or delay. Article X.—Ships of the United States shall be permitted to resort to no other ports in Japan but Simoda and Hakodade, unless in distress or forced by stress of weather. Article XI.—There shall be appointed by the government of the United States consuls or agents to reside in Simoda, at any time after the expiration of 18 months from the date of the signing of this treaty: provided that either of the two governments deem such arrangement necessary."

The harbor of Simoda is near the south-eastern extremity of the peninsula of Idzu, and affords a safe and capacious anchorage. Hakodade lies on a spacious and beautiful bay of that name, and, for accessibility and safety, is one of the finest in the world—capable, says the *Hong Kong Register*, of holding all the fleets of the Pacific in security.

Port Regulations of Simoda.—Three natives have been appointed pilots for American vessels entering or departing from the port of Simoda, and the following rates of pilotage have been established by the proper authorities, viz.: Vessels drawing over 18 feet, pay \$15; over 13 feet, and less than 18 feet, \$10; under 13 feet, \$5.

"These rates shall be paid in gold or silver coin, or their equivalent in goods; and the same shall be paid for piloting vessels out, as well as into port. When vessels anchor in the outer roads, and do not enter the inner harbor, only half the above compensation shall be paid to pilots. A look-out place shall be established at some convenient point, from which vessels appearing in the offing can be seen and reported; and when one is discovered, making apparently for the harbor, a boat shall be sent to her with a pilot. And in order to carry this regulation into full effect, boats of suitable size and quality shall always be kept in

readiness by the harbor-master, which, if necessary, shall proceed beyond Rock Island, to ascertain whether the vessel in sight intends entering the harbor or not. If it may be the desire of the master of the said vessel to enter the port, the pilot shall conduct her to safe anchorage, and, during her stay, shall render every assistance in his power in facilitating the procurement of all the supplies, he may require. The prices for supplying water to American vessels at Simoda shall be 1400 cash* per boat-load (the casks being furnished by the vessel). And for wood delivered on board, about 7200 cash per cube of 5 American feet."

The foregoing is a full summary of the concessions granted to American intercourse by the treaty with Japan of March 31st, 1854. As a means of opening commercial relations with that empire, its provisions have proved inefficient; but, before submitting any notice of facts that have come to knowledge of the Department relative to this subject, it is deemed appropriate to give the leading provisions of the treaty entered into by Great Britain with Japan. The first article of this treaty opens the ports of Nangasaki and Hakodade to British vessels to repair and obtain supplies only. It opens all parts of these ports; but, as respects anchorage, vessels must conform to the instructions of the local government. Safe and commodious places are to be designated for the repair of vessels. Workmen, material, and other necessary supplies to be furnished by the local government, in accordance with a tariff to be agreed upon, which shall regulate the manner of payment. All official communications to be conducted in the English language, as soon as the Japanese shall have acquired a knowledge of that language. A place to be reserved as a burial-ground for the English at Medsuma Sima, which will be inclosed by a stone wall and suitably protected. The second article stipulates that at each of the ports of Nangasaki and of Hakodade, the regulations of the port shall be observed; but the Japanese government will see that these regulations shall be such as to create no difficulties and interpose no obstacle whatever to the general object of the treaty, which is essentially designed to facilitate amicable relations between Great Britain and Japan.

The third article declares that only vessels in distress or dismantled can enter other ports than Nangasaki and Hakodade, without permission of the Japanese government; but ships of war possess, as a necessary attribute of their public character, the general right to enter all the ports of friendly powers; while, however, this right shall suffer no prejudice or restriction, the vessels of war of her Britannic majesty will not enter any other than open ports, without necessity, nor without offering proper explanations to the imperial authorities. The fourth article provides that British ships and subjects in Japanese ports shall conform to the laws of Japan; and that if any subordinate British subjects commit offenses against the laws, they shall be delivered to their own officers for punishment; and that if superior officers, or commanders of ships, shall break the laws, it will lead to the closing of the ports specified: but it is not intended by this article that any acts of individuals, whether high or low, previously unauthorized or subsequently disapproved of by her majesty the Queen of Great Britain, can set aside the convention entered into with her majesty alone by his imperial highness the Emperor of Japan. The fifth article secures, in the fullest sense, to British ships and subjects, in every port of Japan, either now open or hereafter to be opened, an equality, in point of advantage and accommodation, with the ships and subjects or citizens of any other nation, without prejudice, however, to any peculiar privileges hitherto conceded to the Dutch and Chinese in the port of Nangasaki.

* 600 copper cash are equal to 43 cents (arbitrary value). The currency of Japan is similar to that of China, in which 1 tael = 10 maoe = 100 candareens = 1000 cash = \$1.48 U. S. currency.

If, therefore, any other nation or people be now, or hereafter, permitted to enter other ports than Nangasaki and Hakodade, or to appoint consuls, or to open trade, or to enjoy any advantage or privilege whatever, British ships and subjects shall, as of right, enter upon the enjoyment of the same. The sixth article declares that the convention shall be exchanged at Nangasaki, on behalf of her majesty the Queen of Great Britain, and on behalf of his highness the Emperor of Japan, within 12 months from the 14th day of October, 1854.

The governor of Nangasaki communicated, in October, 1854, to Sir James Sterling, the following standing port regulations: ARTICLE 1. Ships shall anchor within two sima, and there await the direction of the governor. 2. No fire-arms are to be discharged. 3. No person to land on any of the islands. 4. No soundings to be taken, nor boats to be pulling about. 5. Should any communications be desired, a boat of the upper officers shall be called; but no communication shall be held with merchant boats, and no exchange of articles take place, or trading of any sort.

The above being, according to the law of Great Japan, all commanders and other officers shall obey the same, and orders shall be given to the crew that the aforesaid law shall not be broken.

An arrangement, made subsequently to the convention with Great Britain, requires that British ships, intending to visit Japan, shall be provided with a document in proof of their nationality, and as a check upon the conduct of vessels in Japanese ports; and her majesty's government has directed a form of certificate of registration to be adopted, which has been accepted as satisfactory by the Japanese authorities; and merchant ships arriving in Japanese ports are to submit their certificate of registration to the officers to be appointed by the Japanese authorities, and to permit them to make such extracts from it as may seem good to them, before such ships can be admitted to obtain repairs and supplies. Her majesty's ships of war are not to be provided with such documents; but the officers in command, upon proper application, will afford all reasonable information regarding their ships.

Holland has also recently formed a provisional treaty with Japan, but it is stated that the Dutch government withholds it from publication. The Singapore papers give the following summary of its provisions: "The Dutch are no longer limited to Decima, but may freely resort to Nangasaki and the immediate neighborhood. The island of Decima is placed at the disposal of the Dutch, and the buildings thereon sold to Holland. This island will serve as an entrepôt for the Dutch, where they can land their goods without payment of duties or search. The keys of the water-gates and of the entrepôt warehouses will remain with the Dutch chief factor. The usual duties will not be exacted until goods are brought to Nangasaki. The trade with the Dutch government remains on the former footing. Free exercise of religion and right of burial is conceded to the Dutch. There shall exist, henceforward, freedom of communication with other ships entering or departing from the roads. A definitive treaty is to be hereafter concluded; but, until that takes place, the present agreement is to be considered in force."

The above is, in substance, all that has been published relative to the convention between Holland and Japan; but, until the definitive treaty, alluded to in the last paragraph, shall have been entered into, the intercourse between the two countries will be of the same limited character that has hitherto existed. Indeed, the Japanese evince an almost invincible repugnance to opening their ports to foreign commerce, and, in their interpretation of treaties, concede nothing beyond what is specifically granted. Thus, the term "temporary residence" in the treaty with the United States, is so strictly interpreted that citizens of this country, who desired to land at one of the open ports,

were required, before being permitted to go ashore, to state how long they intended so to reside; and intimations were given that "four or five days" would be sufficient to satisfy the words of the treaty. In one case, the applicants, whose object appears to have been to reside permanently at one of the open ports, for the purpose of establishing a dépôt for the supply of whaleships, were informed that, until they stated the exact number of days they intended to stay on shore for "temporary residence," they would not be permitted to sleep one night from their vessel.

On the 17th August, 1855, the American schooner *Wilmington*, Brown master, of New London, Connecticut, arrived at Simoda from Hong Kong, with a miscellaneous cargo, supposed to be suitable for trade at that port. Shortly after casting anchor, some 15 or 20 officers came on board, and desired to know on what business the vessel came into port. They were informed that she brought a cargo of American commodities, which the captain wished to sell or exchange for goods of Japanese manufacture. They then informed the captain that they could not trade; that the people at large would be much pleased to do so, but that the emperor had positively prohibited all commercial intercourse, under penalty of death to the offenders. A letter was addressed to the governor of the city of Simoda, which was returned in the same envelope, with a verbal message to the effect that he would not be permitted to land a single article for trade, nor could he present any for trade on shipboard. Wood and water (the former at \$5 per cord) were offered; but fresh provisions, it is stated by the captain, were refused. The vessel was, night and day, surrounded by guard-boats until she cleared from the bay. The *Wilmington* then proceeded to Hakodade, where she met with more liberal treatment, but permission to trade was refused, as at Simoda. The only provisions to be purchased consisted of beans, turnips, scallions, and such vegetables. The cattle the Japanese look upon as sacred, and will neither sell nor kill them. The captain and crew were permitted to go ashore and visit wherever they pleased. They were also exempted from the vigilance of guard-boats, as well as from the constant attendance of guards, as at Simoda.

It seems evident, therefore, so far as appears, that, under the present treaty, the Japanese government will not permit any trade to be carried on; nor is there much probability of the treaty receiving any more liberal interpretation than that given to it by the officials at Simoda. It is, as the Japanese aver, a treaty of peace and amity only, strictly guarded against any concession or clause under which American citizens could claim the privileges of general trade.—*Com. Rel. U. S.*

To America undoubtedly belongs the credit of having been the first to re-establish commercial relations with Japan. The increased traffic in this part of the world, particularly between eastern Asia and north-western America, and the importance of the whale-fishery in the Japanese seas, had rendered it very desirable to have free access to at least some of the ports of Japan. Repeated attempts had been made by England, Russia, and the United States, but without success, when at length the United States' government resolved to make an effort worthy of the object, and accordingly fitted out an expedition under the command of Commodore M. C. Perry. The commodore sailed from Norfolk in the *Mississippi* war-steamer, on the 24th of November, 1852, to be followed as soon as possible by the other vessels of the expedition. He arrived in the Bay of Yeddo on the 8th of July, 1853, with four vessels, two war-steamer, and two sloops of war, and after some negotiations he delivered the letter of the President, promising to return for an answer in the spring. The rest of the year was spent at Loo Choo and China, and on the 12th of February, 1854,

the squadron reappeared in the Bay of Yeddo, having by this time been increased to nine vessels, three steam-frigates, four sloops of war, and two store-ships. A treaty was concluded on the 31st of March, in terms of which the ports of Simoda in the island of Nipon, and Hakodade in Yesso, are opened for the reception of American ships, where they will be supplied with wood, water, provisions, coal, and other articles, so far as the Japanese possess them. Ships in distress, or from stress of weather, may enter other ports; and seamen shipwrecked on any part of the coast are to be aided and carried to either Simoda or Hakodade. Shipwrecked seamen and others temporarily residing at these ports, are, at Simoda, free to go anywhere within the limits of 17 English miles from a small island in the harbor, and in like manner at Hakodade within 12 miles. Ships of the United States are also permitted to trade under such regulations as shall be temporarily established by the Japanese government for that purpose. All the privileges that may hereafter be granted to any other nation are to be accorded to the United States. On the 7th of September following, an English squadron, consisting of a frigate and three steamers, under the command of Rear-Admiral Sir James Sterling, entered the harbor of Nangasaki. The primary object of this visit to Japan was to search for Russian vessels, but it was also intended to attempt to establish friendly relations between the two nations. A treaty was entered into, the effect of which is to open absolutely and at once to British ships of every description, for effecting repairs and obtaining fresh water, provisions, and other supplies, two of the most convenient harbors in Japan—Nangasaki and Hakodade; to open inferentially to British ships in distress any other port in Japan it may be expedient for them to seek shelter in; to secure eventually to British ships and subjects in every port of Japan which may hereafter be open to foreigners, equal advantages with the ships and subjects of the most favored nation, excepting only the advantages at present accorded to the Dutch and Chinese. It imposes in return for these concessions, no other obligation on British ships and subjects than that of respecting the laws and ordinances of the ports they visit. More recently the Russians have succeeded in obtaining a similar footing in Japan. See *Ency. Brit.*, 8th. edition; *HUNT's Mer. Mag.*, i., 208, xxxi., 234, 626, xxxiv., 120, 742; *Nor. Am. Rev.*, x., 83 (by N. HALE); *Quar. Rev.*, xxii., 107, lii., 159, vi., 357; *PERRY's Japan Exped.*, 1854; *Living Age*, x., xiv., xxiii.; *DE Bow's Rev.* ix., 441.

Japanned Wares (Ger. *Japanische ware*; Du. *Japansch lakwerk*; Fr. *Marchandises de Japon*), articles of every description, such as tea-trays, clock-dials, candlesticks, snuff-boxes, etc., covered with coats of Japan, whether plain, or embellished with painting or gilding.

Japanning, a species of lac-varnishing, in imitation of the lacquered ware of Japan, which, with that of China, is esteemed the best in the world. The ware may be lacquered upon wood, metal, or papier-maché grounds. A description of the process as practiced in China may serve to explain the sources of superiority. The article, if of wood, being made very dry, light, and smooth, is primed with a mixture of ox gall and rottenstone, which is rubbed smooth before the varnish is applied. The varnish is composed of 605 grains of gum-lac in 1200 grains of water, to which are added 38 grains of oil of *Camellia sasanqua*, pig's gall, and 19 grains of rice vinegar. The ingredients are well mixed in full daylight, when the varnish gradually deepens into a brilliant black. A very thin coat of this varnish is applied with a flat hair brush. The article is left in a steamy heat, and is then rubbed down in water with very fine pumice. A second coat of lac-varnish is next applied, and the polishing is repeated, which two operations are continued until a perfectly even and brilliant surface is

attained, a finer quality of lac being used for the later coats, of which there are never less than three, nor more than 18. The object is ornamented by an artist, who draws the design in white lead, engraves it, and fills up the details. The article is next painted with the camphorated lac of Kouang-si, which serves as a basis for the gilding. It is completed by varnishing.

In our method of japanning, the wood intended for the best works is thoroughly dried, since any warping or shrinking would be fatal to the finished surface; for which purpose well-seasoned wood is cut nearly into the required forms, and exposed for several days to a gradually increasing heat in the japanner's stove. The articles are then finished as to form, and are again stoved, after which the cracks are stopped with putty or white lead. For black japanned works, a ground of ivory-black mixed with dark-colored animè varnish is applied. This is dried in the stove, and coated with varnish three or four times, the work being stoved between every two coats. For colored grounds, the varnish mixed with the proper color is laid on in one or two coats, and the work is completed by several successive varnishings and dryings. Ordinary painters' colors ground with linseed oil or turpentine and mixed with animè varnish are employed for various black or brown surfaces with gilt edges, imitations of marble, fine-grained woods, tortoise-shell, etc. The colors mostly used are flake-white or white lead, Prussian-blue, vermilion, Indian-red, king's yellow, verdigris, lamp-black, and the various tints produced by their admixture. The varnishes used are copal, seed-lac, animè, and mastic. The lac varnish is the best for hardness, but its color prevents its use for delicate grounds, so that for such purposes it is either mixed with gum varnish, or copal varnish is used instead. Copal or animè varnish made without driers is applied, in from two to six coats, after the color has been laid on. See VARNISH.

Japanners sometimes use a priming of size and whiting, which is laid on with a brush, and left for a day or two to dry; it is then made smooth by rubbing with rushes and a wet cloth. When this is quite dry, the grounds are laid on, and finished by varnishing and polishing with rottenstone, or in the case of a white ground, with putty or starch, and oil. It must, however, be remarked, that a priming, or artificially prepared ground, is objectionable, the japanning being more liable to crack than when executed on the actual surface of the object itself. A gold ground is formed by varnishing the work with japanner's gold size, and when nearly dry, but still clammy, covering it with gold dust applied on a piece of wash-leather; the effect of such a ground when highly varnished is very brilliant. Japan work is ornamented with drawings or engravings, on the principle of transfer, for which purpose the engraving is printed, or the drawing executed on fine paper previously prepared with a coat of isinglass or gum-water. When this is dry it is placed face downward upon the japan ground, which is covered with a thin coat of copal varnish. A sponge dipped in warm water is then applied to the back of the paper, which dissolves the isinglass, loosens the paper, and leaves the print on the work. Another method is to execute the print on an elastic composition of glue, etc., which receives the impression well, and can be laid down at once on the japanned surface. The whole of the processes require so much drying, that stoves are requisite to hasten the work.

The great demand for japanning is for works in *papier maché*, to which article we must refer for further information on the subject. Common articles of furniture are sometimes said to be japanned, thereby implying that they are more durable than common painted articles. The term as thus used is, however, incorrect, since the colors employed on such common works are only mixed with turpentine instead of oil. For japanning works in metal, they are cleaned with

turpentine to get rid of grease or oil, unless the oil should be linseed, in which case the articles are stoved until the oil becomes quite hard. Japanning is then performed in the usual manner.—E. B.

Jasper (Ger. *Jaspiss*; Du. *Jasiss*; Fr. *Jaspe*; It. *Diaspro*; Sp. *Jaspe*; Rus. *Jaschma*). This stone is an ingredient in the composition of many mountains. It occurs usually in large amorphous masses, sometimes in round or angular pieces; its fracture is conchoidal; specific gravity from 2 to 27. Its colors are various; when heated it does not decrepitate; it is usually divided into four species, denominated Egyptian jasper, striped jasper, porcelain jasper, and common jasper. It is sometimes employed by jewelers in the formation of seals.

Java, the first in importance, although only the third in magnitude of the islands in the Indian Archipelago, lies between east long. 105° 12' and 114° 4', and south lat. 5° 52' and 8° 40'. In form it is long and narrow, being 666 miles in length from east to west, by from 56 to 136 miles in breadth. Area 50,260 square miles. To the north-west it is parted from Sumatra by a strait, at its narrowest part only 14 miles wide, and with islands between; and to the east from Bali, by a strait of no more than two miles broad. On its low, and in some measure sheltered north coast, Java has a good many islands, by far the largest and most important of which is Madura, separate from it by a strait at one part only about a mile wide. On the bold precipitous south coast there are very few islands, and only two of a considerable size, Baron and Kambangan. The coast line of Java, which is about 1400 English miles in extent, has many bays on its northern coast, but it is not deeply penetrated by any one of them, so that it has properly no harbor but one, that of Surabaya, formed between the main island and Madura, where the strait that divides them is still narrow. The southern coast is still less indented. Here there are two harbors only, Pachitan—inconvenient and unsafe—and Chalachap, formed between the main island and Kambangan, both out of the way of intercourse, and little frequented. On other parts of the south coast there is no safe anchorage, while dangerous surge rolls in on the shore in all seasons. With the single exception named, the ports of the northern coast are but open roadsteads, with good anchoring ground; but the want of land-locked harbors is not felt so near the equator, where hurricanes are never experienced, and where the weather is only occasionally tempestuous at the change of the monsoons.

The physical outline of Java may be divided into five different sections of various breadths. Beginning from the western end and following the line of the northern coast, the first section ends with the eastern side of the bay of Batavia. This is about 75 miles in average breadth. The second extends east as far as Cheribon, in long. 108° 36', and is about 95 miles broad. Both these divisions are mountainous, the mountains being of less elevation than in the other parts of the island, but more crowded, and with narrower valleys. They constitute the proper country of the Sundas, who speak a distinct language, and are less advanced in civilization than the Javanese, the nation which occupies all the rest of the island. The third section extends from Cheribon to the western side of the promontory of Japara, in about long. 110° 30', and its breadth does not exceed 60 miles, the island being greatly narrowed by the bay which extends for 140 miles from the point of Indramaya to that of Sapara. The fourth section extends from the promontory of Japara to that portion of the island which is opposite to the western end of Madura, and this has an average breadth of 100 miles. The fifth section embraces the remainder of the island, and is no more than 50 miles in breadth. In the three last sections, the mountains are of greater elevation, the

plains more spacious, and along their northern coasts there runs generally a belt of alluvial land varying from 5 to 15 miles in depth.

The geological formation of Java is eminently volcanic. A range of mountains runs in a longitudinal direction through the centre of Java, the peaks of which vary from the height of near 4000 to near 12,000 feet above the level of the sea. No fewer than 46 of those peaks are volcanoes, 20 of which are in a state of greater or less activity. The craters are sometimes of great extent, and their walls illustrate the structure of the mountains, which is either vertical and irregularly columnar, or disposed in oblique or horizontal strata.

Java has no extensive collection of water, salt or fresh, and no large lagoons connected with the sea. There exist, however, a few beautiful mountain lakes. One of those lies within the mountain Wilis ("the green"), which parts the plains of Madiyun and Kadiri, and is known by the name of *Gabal*. There is a second in the province of Cheribon, known by the Sanscrit name of *Talaga*, or the reservoir; and a third is in the province of Pasuruhan and called *Bafunila*, or the blue water. In Java, however, there are several extensive marshes, which, in the season of the rains, become lakes, are navigated, and have fisheries. The rivers of Java, especially on its northern side, are numerous; but from the form of the island, they are of small size. None of them are navigable for vessels of burden, and few even for boats beyond the reach of the tide. They are all, more or less, obstructed by mud or sand-bars at their mouths. Though of little utility for trade, they are excellently adapted for irrigation. Few of the rivers of Java have specific names, but take their appellations generally from the places they pass by, and change them with every new one, a circumstance which may, perhaps, be owing to their small size and great number. There are, however, a few exceptions, in some of the larger, as the *Saraya*, a river of the province of *Bafumas* and the *Praga*, with its tributaries the *Elos Rivers* of *Kadu*, all debouching on the southern coast.

Climate.—The climate of Java is what may be expected in a narrow sea-girt country between five and eight degrees south of the equator, having plains almost on a level with the sea, and inhabited land 5000 feet above it. The wet season begins with October and ends with March, and the dry with April and ends with September. The monsoons are those of the southern hemisphere, the north-western corresponding with the wet season, and the south-eastern with the dry. The setting in of these monsoons is irregular, and, even during their prevalence, there is some dry weather in the wet, and not unfrequently rain in the dry. At the equinoxes, when the monsoons change, the weather is very unsettled, and most tempestuous at the commencement of the winter solstice in September and October. Thunder-storms are then frequent, and often destructive to life. Land and sea-breezes are experienced within 15 miles of the northern and southern coasts, and in particular localities of its eastern and narrowest extremity the south-eastern monsoon blows with great force across the whole island. The temperature, so far as the seasons are concerned, is equable. Near the level of the sea, which is that of the great alluvial band, which runs along the northern side of the island, and of the wide plains of the interior, Fahrenheit's thermometer seldom falls below 70°, and seldom rises above 90°. According to the elevation of the land, every variety of temperature is experienced from this last to 5° below the freezing point. Snow never falls, even on the highest peaks; but on these at the height of winter, in July and August, ice a few lines thick is formed, and hoar frost is seen every morning, called by the natives, *poison-dew* (*ambun-upas*), from its pernicious effect on vegetation. In the inhabited mountain valleys, at

the height of 4000 feet, the thermometer is usually about 20° below what it is at the level of the sea. Here is experienced a climate agreeable and congenial to the European constitution; and here, the corns, fruits, flowers, and esculent vegetables of temperate regions, have long been acclimated. In point of salubrity, the climate of the high lands of Java is unexceptionable, and that of the low, containing the mass of the population, is generally equal to that of any other tropical country. In a few spots of the alluvial band of the northern coast, such as *Batavia* and *Cheribon*, deleterious malaria have occasionally prevailed, arising from the neglect of canals and water-courses, or from these being obstructed by volcanic débris; but these are exceptions, as are also a few forest tracts of the interior of the island. The extensive cultivation of rice by irrigation might have been expected to generate malaria, but such is not the case, nor has it ever been alleged to have done so in the country itself.

The elephant is not found in Java, nor does there exist any evidence of its ever having been indigenous, and this is the more remarkable as it is abundant in *Sumatra*. The animal, however, was known to the Javanese for ages, and was probably imported occasionally for the use of its princes. Java has one rhinoceros peculiar to itself, and differing even from those of *Sumatra*. It is an animal easily tamed, and when so, gentle in its habits. Besides the domesticated hog, Java has two wild species, the *Sus verrucosus* and *Sus vittatus*. Both are very numerous, and their depredations are a serious impediment to agriculture.

A wild ox is found in the forests of Java, the same as that found in the peninsula and *Borneo*, but which is wanting in *Sumatra*. It is the *Bos sondaicus* of naturalists. The Dutch naturalists inform us that all attempts to tame it have been vain, as in the case of the buffalo of the American prairies. According to the Javanese, however, it will pair with the domesticated cattle, producing a fertile offspring, to which they attribute the largest breed of their oxen. The buffalo, *Bos bubalus*, is found wild in many of the forests of Java, but considered by naturalists to be derived from individuals in the domestic state that had escaped from servitude. The horse nowhere exists in Java in the wild state, but the numbers of this animal and of horned cattle in the domestic state throughout the island are very large, the Dutch returns reckoning the first at 320,000, and the last at about 2,000,000.

Fish are plentiful along the whole northern coast of Java, and a few species are of excellent quality, but, upon the whole, the abundance and the quality are not equal to those of the shores of the Straits of *Malacca*. The fresh water fish are all of very inferior quality and no migratory species frequent the rivers for spawning as they do on the rivers of the eastern side of *Sumatra*. Shell-fish are very abundant on the northern coast, especially oysters of excellent quality, and prawns, the last being much used by the people in the shape of the condiment called by the Javanese *trasi*. The fisheries of the exposed southern coast of the island are unimportant.

Java, whether the inhabitants be of the Javanese or *Sunda* nation, is peopled by the same race, the *Malayan*. This is characterized by a short and squat person, the stature being about two inches less than that of the European, the Chinese, the Hindoo, the Persian, or Arabian. The face is round, the mouth wide, the cheek-bones high, the nose short, small, never prominent as with the European, and never flat as with the African negro. The eyes are always black, small, and deep-seated. The complexion is brown, with a shade of yellow, not so dark as with the majority of Hindoos, and never black as with some of them. Fairness is, indeed, in estimation with the Javanese and others of the same race. The hair of the head is abundant, always black, lank, and harsh, or at

least never soft or silky. The hair on other parts of the body is either scanty or altogether wanting. The beard consists only of a few short straggling hairs, and there is none at all on the breast or limbs. The Javanese, personally, are not an agile people, and make very indifferent runners or wrestlers. As to moral character, the Javanese of the present day may be described as a peaceable, docile, sober, simple, and industrious people. The practice of running a muck, so frequent with the other cultivated nations of the Archipelago, is of very rare occurrence with them. Java was populous, and to a considerable degree civilized for many ages before it was known to Europeans. De Barros describes the Javanese, at the arrival of the Portuguese, as what they still are, "the most civilized people of these parts" (*gentes de mais policia*). They were then found carrying on trade from Sumatra to the Moluccas; they furnished bread-corn and manufactures to the less advanced nations in return for their rude productions, and they had effected conquests or settlements in Malacca, Palembang in Sumatra, and in the two fertile islands of Bali and Lombok. In fact, it is certain that the Javanese were, at this time, a far more civilized, probably even a more numerous people than either the Mexicans or Peruvians, who became known to Europe nearly at the same time. The essential part of Javanese civilization seems to be of native origin and to have sprung up in the island itself, although it subsequently received considerable accessions by intercourse with Hindoostan.

With the exception of the people of Bali and Lombok, the Javanese are the only nation of the Archipelago that can be said to be almost exclusively agricultural. With the exception of the fishermen of the northern coast, and a small proportion of artisans, the computed ten millions of the population of the island is directly or indirectly engaged in agriculture, and have made a respectable progress in it. To regulate the processes of agriculture, the Javanese have a rural calendar still in use. This consists of a year of 360 days, beginning with the winter solstice of the southern hemisphere in the end of June, and divided into twelve seasons of unequal length, varying from 23 to 41 days each. It details the times for clearing and preparing the land, for sowing, for transplanting, and for reaping the different crops. The native terms by which the seasons are named, are, for the most part, the ordinal numbers of the vernacular language, while the adaptation of the seasons to the latitude of Java sufficiently show that this calendar is a Javanese invention, and not borrowed from strangers. Irrigation, in so far as the rice crop is concerned, multiplies the productive powers of the soil from five to tenfold, according to the abundance of water, and the facility of using it, and has been carried to such an extent in Java that the majority of the arable land of the island consists of rice fields. The perennial streams and rivers, as they descend from the mountains, are, by means of embankments and trenches, diverted into small fields surrounded by low dikes, which can be flooded or drained at pleasure. The process of forming such lands is expensive and laborious, but when once formed, they are easily preserved. When the water for irrigated lands is sufficiently abundant and continuous, two crops of rice are raised within the year, and in some cases even three within fifteen months, the sun being hot enough to ripen rice in every season. The husbandman may follow his convenience as to the time of sowing, and in contiguous fields may be seen at once sowing and reaping rice, with every intermediate stage of the growth of the plant. When the water is not sufficiently copious for two crops, the rice is sown in the wet or hot season; and in the dry, or cold, crops considered of secondary value are produced, such as pulses, oil-giving plants, and cotton. No manure is ever applied to irrigated lands, nor are fallows practiced.

Dry or upland arable is of small value compared to irrigated land. On the best dry lands rice is occasionally grown, but more generally these lands are used for such crops as pulses, oil-giving plants, cotton, sugar-cane, and tobacco, and on the mountain-slopes, at an elevation of 2000 and 3000 feet, for coffee. In the most fertile parts of Java, which, from the neighborhood of the high mountains, are usually also the most picturesque, the scenery is at once agreeable and magnificent, and certainly for grandeur and beauty excels all that may be seen, even in Italy, that country which in summer bears the nearest resemblance to Java. In such situations we have mountains 10,000 feet high, cultivated to half their height, the valleys below having all the appearance of a well-watered garden.

When Java first became known to Europeans, its principal agricultural products were rice, pulses, sesame, ground-pea, and other oil-giving plants, indigo and cotton, with palms and indigenous fruits. European intercourse has added to these, maize, tobacco, and coffee. The quantity of its great staple, rice, which it produces, can only be estimated. With the exception of a small quantity of maize, rice is the only bread-corn of the Javanese; and, therefore, if we take the consumption per head at a quarter, or 448 lbs., this, on a computed population of 10,000,000, will make the total annual produce the same number of quarters. The export is, at present, too inconsiderable materially to affect this computation, for in 1848 it amounted to no more than 217,000 quarters. From the first appearance of Europeans, and no doubt for many ages before, Java was the greatest granary of the other countries of the Archipelago. Recently the extensive culture by *corvée* labor of such products as sugar, coffee, and indigo, under an idle and pernicious hypothesis that some peculiar commercial advantage to the State belonged to their culture, has greatly interfered with the production of corn. The export of it has consequently diminished, and the price materially risen; the consequence of which has been, that countries immemorably supplied by Java, now draw their corn from other places, such as Bali, Lombok, Siam, and Arracan.

Mechanic Arts.—The state of the mechanic arts among the Javanese is far below that of their agriculture, but still in advance of that of the other nations of the Archipelago; and with the exception of textile fabrics, not below that of the Hindoos. About thirty different crafts may be enumerated as practiced among them, the most important of which are the blacksmith or cutler, the carpenter, the kris-sheath maker, the coppersmith, the goldsmith, and the potter. Both bricks and tiles are, at present, largely made; and excellent bricks are found in the remains of many ancient temples, proving that the art of manufacturing them has been known for many ages. Coarse unglazed pottery, similar to that of Hindoostan, is also made; and the names of the different sorts all belong to the vernacular language. Beyond the manufacture of this coarse article, the Javanese have not advanced—all their better pottery having been for ages received from China. Their skill in carpentry is displayed in house and boat building, in the fabrication of agricultural implements, and of the hilts, shafts, and scabbards of warlike weapons. The ordinary dwellings of the peasantry consist of a rough frame of timber, thatched on the coast with the leaves of the nipa palm, and in the interior with grass; having walls and partitions of split, flattened, and plaited bamboo work. They are always built on the ground. The dwellings of the upper classes differ, chiefly, in their greater size, with the exception of the palaces of the princes and higher nobility. Boat-building is an art extensively practiced all along the northern coast of Java. Their boats vary in form and size from mere fishing canoes to vessels of fifty tons. The building

of ships is, at present, carried on under the direction of Europeans, the workmen, however, being all Javanese. When Europeans became first acquainted with the Javanese, they were possessed of vessels of large size, well entitled to the name of ships. The agricultural implements of the Javanese are, like those of nearly every other Asiatic people, simple and rude.

The Javanese of the present day have no architecture that deserves the name, and apart from the temples of their ancient worship, no relics remain of any kind of domestic architecture, of bridges, of reservoirs, or of embankments of rivers, such as are found in the country of the Hindoos. The remains of the remarkable edifices connected with the Hindoo religion are abundant; but it is singular that an improved architecture ceased with that religion, and that no Mohammedan structure of solid materials or beauty has been constructed since the adoption of the Mohammedan religion toward the end of the 15th century.

It is in working the metals, however, that the Javanese have most excelled, and as they acquired this comparative excellence without possessing any of the metals themselves, but having all of them imported, the fact may be considered as evidence of comparatively advanced civilization. According to the Javanese, the first rank among artisans is to be ascribed to the blacksmith, or at least to the cutler. The most esteemed product of his skill is the dagger, the well known kris. Every man, and boy of 14, wears at least one kris as part of his ordinary dress, and men of rank two, and sometimes four. Even ladies of high rank occasionally wear one. Swords are used only in native warfare, and are much less esteemed than the kris, the national weapon. The Javanese spear, a plain pike with an iron head, is a formidable weapon, from its long shaft of from 12 to 14 feet. Some of the Javanese crises, from their antiquity, are highly appreciated, and when sold bring enormous prices. The Javanese had also, before the arrival of the Portuguese, a knowledge of gunpowder and artillery. De Barros, in describing an expedition which invaded Malacca in 1513, says, "that it was furnished with much artillery, made in Java, for," adds he, "the Javanese are skilled in founding or casting, and in all work in iron, besides what they have from India."

The Javanese, although they manufacture gold and silver ornaments of considerable beauty, execute nothing equal to the filigree work of Sumatra. In works in brass, their chief excellence consists in the fabrication of musical instruments, a full band of which is known throughout the Archipelago by the Javanese name of *gambelan*. The instruments consist chiefly of bars, constructed after the manner of the *staocata*, or of the gong, a word which has found its way into our dictionaries and is genuine Javanese. Some of these gongs have been made three feet in diameter. Musical instruments of this description are still manufactured in Java, and form an article of exportation, as, indeed, they are said to have done on the first arrival of the Portuguese.

The only textile material of native produce is cotton, rather a coarse article, and the only kind of cloth made from it is a stout durable calico, the muslins and other fine textures of continental India being unknown as manufactures. The processes of cleaning and preparing the cotton, of spinning, weaving, and dyeing, are all carried on by women, and are purely domestic operations, as is the case with all the other nations of the Archipelago. The usual mode of giving variety of colors to the web is the simplest possible, consisting in weaving the previously colored yarn in stripes, checkered or tartan patterns, so frequent with the other tribes, being against the taste of the Javanese. Another mode peculiar to this people consists in covering with melted wax the part of the cloth not intended to be dyed before putting it in the

vat, the process necessarily requiring repetition in proportion to the number of colors intended to be given. The only material, besides cotton, from which cloth is made by the Javanese is silk, and as the art of rearing the silk-worm has never been successfully introduced into Java, the raw material has always been imported. At present it is imported from China, an inferior silk, from which a coarse cloth is wrought with the same implements as that of cotton. Paper is a manufacture peculiar to the Javanese. It is of the nature of the papyrus of the ancients, and not of the beautiful and ingenious fabric which the nations of Europe acquired from the Arabs of Spain, and so long known to the Chinese.

Two languages are spoken in Java, of the same general structure, belonging to the same class of tongues, and having many words in common, yet essentially differing from each other. These are the Javanese and Sunda. The Javanese has been immemorably a written language, and its alphabet has extended to the Sunda language. Inscriptions on stone and brass carry us back in its history to the 12th century. The written character is of two descriptions, that found in ancient inscriptions, and that at present current. They seem, however, to be essentially the same, and not to differ more than black letter from modern manuscript.

History.—Java was unknown even by name to the civilized nations of ancient Europe, and even to those of the middle ages. It is first named by Marco Polo, who, in his junk voyage from China to the Persian Gulf, passed through the northern part of the Archipelago about the close of the 13th century. He gives the name as *Ciaua* or *Java*, but his information being mere hearsay, is in other respects erroneous. Thus, mistaking probably the products of its commerce for its indigenous productions, he enumerates among the latter cloves and nutmegs, and gold in quantity "exceeding all calculation and belief," although it produces none at all. No sooner had the Portuguese reached India by the Cape of Good Hope than the name became familiar enough to Europeans. L. Barthema visited the island and remained fourteen days in it, but his account is obviously false or worthless, for he describes parents as selling their children to be eaten by the purchasers, and himself as quitting the island in haste for fear of being made a meal of. Edoardo Barbosa, although he had not visited it, describes its productions, its trade, its manufactures of arms, and the persons, dress, and manners of its inhabitants, with much accuracy. Pigafetta, although his information respecting it was derived, as he tells us, himself, from the old pilot who accompanied him from the Moluccas, is even more correct than Barbosa. How very little, however, was really known of Java by the early Portuguese of India, is to be seen from what De Barros, master of all the Indian archives, says of it in his *Third Decade*, published in 1663, no less than 52 years after the conquest of Malacca, and several years after his countrymen had visited China, discovered Java, and traded with both. He makes it consist of two islands, Java and Sunda; and his work contains a rude map, in which a great river, or rather a strait of the sea, is represented as dividing them. This he calls the River Chiamo, which may possibly be the Chitando of the Sundas, a considerable stream at the eastern boundary of their country, and which, in their language, signifies, "boundary water or river."

It was in the reign of the second prince of this dynasty, that the Dutch made their first appearance in Java, under Houtman, in 1595. In 1610 they obtained permission from the Sunda prince of Jacatra, to build a fort near the spot on which now stands the city of Batavia. In 1619 this fort was besieged by the joint forces of the princes of Jacatra and Bantam, aided and abetted by the English. It was relieved by a Dutch fleet under admiral Koen, and the assailants defeated

and driven off. It was after this event that the name of Batavia first given to the fortress was bestowed on the town. In 1628 Batavia was besieged by a numerous army sent against it by the reigning prince of Mataram, with the hope of expelling the Dutch from the island; but by the skill and courage of the European garrison, the rude and disorderly host was baffled and routed. From this time the history of Java is properly that of its European conquerors. No considerable territorial acquisition, however, was made until 1677, when the Dutch obtained a cession of the principality of Jacatra. From that time up to the year 1830, every war carried on by them with the native princes, whether as principals or auxiliaries, invariably ended in a cession of territory to the former; so that, at present, hardly one fourteenth part of the island is in possession of native rulers, and even that is entirely tributary and dependent. From the year 1674 to 1880, the Dutch, as principals or auxiliaries, have been engaged in no fewer than four great wars, all of long duration; one of which, begun in 1674, lasted for 34 years; one in 1718, lasted for 5 years; one in 1740, for 15 years; and one in 1825, for 5 years; so that, of one third part, at least, of a period of 156 years, civil war raged in the island. The Dutch have divided their possessions in Java into 20 provinces or residences, each of which is administered by a resident or prefect. Six of these belong to the country of the Sundas, and 14 to that of the Javanese. The two remaining native States, although administered by their own princes, are virtually Dutch provinces, and placed under the control of an officer, with the same title as those of the provinces under direct Dutch rule.

Population.—Attempts have been made at various times to estimate the total population of Java. The first of these was by the historian Valentyn, who estimates the population in his time (1726) at 3,199,750; and including Madura, 3,591,500. This estimate was made shortly after a civil war of five years' duration. In 1755, immediately after the finest parts of the island had been the theatre of a civil war of 15 years, an estimate was made which gave Java only 1,941,911, or including Madura, 2,001,911. This would seem to show that in less than 30 years a decrease had taken place exceeding a million and a quarter. At the close of the last century, estimates of the population were made, which raised the joint population of Java and Madura to 3,559,611. This was after a continued peace of 45 years; and shows, compared to the last estimate, an increase exceeding a million and a half. In 1808 another estimate was made, and by this, the number was made 3,780,000. In 1815 a census was attempted during the temporary occupation of the English, which raised the population of Java to 4,390,661, or including Madura, to 4,615,270. In 1826 a census was taken which gave the population at 5,403,786. 10 years later, another was taken, and this raised the number to 7,861,551; and consequently gave a decennial increase at the rate of about 44 per cent. The census of 1845 made the joint population of Java and Madura 9,580,781, or of Java alone, 9,235,038. The last census is that of 1852, and this made the joint population of Java and Madura 9,943,075. The population was estimated as being, on 31st December, 1853, 10,290,000.

Revenue.—The revenue of the European government of Java is that of the whole island, including Madura; excepting as to some taxes on consumption, the territories are subject to the two remaining native princes, embracing an area of 2229 square miles, and a reputed population of 850,000. It is derived from multifarious sources, and may be briefly described, taking the figures from the public accounts of 1843, as given by Mr. Temminck. These may be sufficient for a general view, as no material change has since been made in the fiscal system.

During the five years' temporary occupation of Java by the British government, from 1811 to 1816, nearly

the whole ancient system of monopolies, forced deliveries, and corvée labor was overthrown, and free culture, open trade, and free labor substituted for them. The merit of this great revolution in the administration of the island belongs to the late Sir Stamford Raffles, the British lieutenant-governor of Java, under the supreme government of India; and he carried his bold and valuable innovations into effect with a courage, industry, and perseverance entitled to the greatest praise. The financial system which he adopted, however, was not so happy, in so far as the land-tax was concerned, for it proceeded on the principle of the States entering directly into an arrangement with each individual occupant of a few acres, in the case of Java probably not fewer than half a million. Under this system, the tax was paid either in money or in kind, at the option of the occupant; and being generally paid in the latter, it followed that the government was converted at once into warehouse-keepers, and corn-merchants. As in other territories on the continent of India, the new system was found mischievous and impracticable. The land was over-assessed, and the hypothetical land-tax could not be realized.

After two years' trial, the Dutch commissioners who received charge of the island, judiciously abandoned the Ryotwarrie system of 1814, and arranged with the heads of the village corporations for the land-tax, leaving its distribution among the occupants to these corporations themselves. This natural and simple system, the only one suited to such a state of society as that of Java, after being in operation for 14 years, was partially relinquished in 1832, and the old system of forced deliveries of certain agricultural products, and of corvée labor in raising them, was, to a large extent, restored. The pretext for this was the hope of greater gain, and the assumption that, by the immemorial usage of the country, the State was entitled to take, at its option, its tax in money, in kind, or in corvée labor. Under this system, a considerable portion of the tax on rent is remitted, and some of the best land with the labor of its peasantry has been appropriated to the cultivation of products deemed peculiarly fitted for the markets of Europe, such as coffee, sugar, and indigo, with tea, cinnamon, and cochineal, and the last three expressly introduced into the island for this special purpose. By this impolitic measure, the Dutch government has become, once more, a cultivator, a trader, and necessarily, from its position, to a certain extent, a monopolist trader. The evil effects of such a system on that wealth, which is the only source of public revenue, must be obvious to every enlightened statesman.

The actual amount of the tax on rent or land-tax remaining to the Dutch government, after deducting exemptions, was, in 1843, allowing 20d. to the florin, £835,551. To this, however, is to be added a sum of £26,215 for the quit-rents of land sold at various times in fee-simple to Europeans, with other items of the nature of a land-tax, as the rents of certain fish-ponds, or stews, amounting to £27,302, making the total land-tax realized £889,128. No account is rendered of remissions on account of land appropriated to the culture of produce for government, but a few facts are stated which will give a tolerable notion of the extent to which this very barbarous system is carried. The number of Javanese families from which corvée labor was exacted for the culture of coffee, in 1841, was 453,289, and for that of sugar, indigo, and cinnamon, 350,955, making the total number, exclusive of those employed in the cultivation of tea and cochineal, which is not stated, 704,244 families, equivalent to a population exceeding three millions and a half, or 40 parts in 100 of the entire population of the European portion of the island. The quantity of land set aside for the cultivation of sugar, indigo, and cinnamon, amounted in 1841 to 317,635 acres, and this consisted of the richest irrigated lands of the island, usually yielding two

yearly harvests, and equal in value to 10 times that of the average of all dry lands. The quantity of land, of an inferior description, appropriated to the culture of coffee and tea, all peculiarly fitted for the growth of maize, is not stated, but some notion of it may be formed from the number of families employed, as above given, and from the number of trees, which amounted in 1841 to 336,922,460.

The taxes on consumption are multifarious, consisting of monopolies, excises, customs, transit and market duties, taxes on fisheries, and on the slaughter of cattle. The chief monopolies are those of the vend of opium and salt. In 1843 the first of these amounted to £796,630, and the last to £384,159. The monopoly of opium is at once productive and unexceptionable in principle. That on salt is, of course, a poll-tax, which amounts to about 4s. on each family, and is only less onerous than our own in Bengal, from the salt of Java, the produce, chiefly by solar evaporation, of its northern coast, being better, cheaper, and more economically distributed to the consumers than that of Bengal. Another monopoly is that exercised in certain caves producing the esculent swallow-nests, and this, as the birds are the chief manufacturers, and strangers the chief consumers, is an unexceptionable source of revenue. In 1843 its amount was £24,271. The sale of timber from the teak forests, which are the exclusive property of the government, constitutes another monopoly, of which the produce in the same year was £42,141. These different items make the total revenues arising from monopolies £1,247,201. In the public accounts the monopoly of the tin of Banca is set down as Javanese revenue, and stated at the sum of £250,000. As the revenue of Java alone supplies the funds with which the mining and smelting is carried on, this branch is therefore correctly enough included in the financial resources of that island.

The export and import duties of Java in 1843, including port charges, amounted to £460,840; and the market, transit, and ferry dues, came to £262,672. The tax on the slaughter of cattle was £39,341, and that on fish and fisheries £27,911. It is not necessary to add that the two last, as taxes on necessities of life, are injurious imposts. A strange want of attention to an obvious principle is evinced by the European government of Java, connected with the slaughter of cattle. The slaughter of the buffalo is expressly prohibited, with the avowed object of increasing the number of this animal for the benefit of agriculture. The certain effect of the prohibition, however, must of course be the very reverse of what is intended, for the rearing of these animals, is surely discouraged, not promoted, by depriving the owners of a market for the old, imperfect, or superfluous ones.

The expenses of the government of Java in 1843, were given at the sum of £6,291,606. Thus, then, the expenditure exceeded the amount of the taxes by the enormous sum of £3,082,249, to be made good by the contingency of profits on produce remitted to Europe. The civil charges came to £827,825, the military to £720,319, the naval to £138,846, and the extraordinary expenditure, on account of Sumatra, to £220,076. The expense of dispatching government produce, exclusive of freight and charges, amounted to £75,212, while the interest of the public debt, nearly all incurred in 27 years' time, came to £1,018,463, or about half of that of British India, with 120,000,000 of inhabitants, and which it has taken a century to incur.

Trade.—The internal trade of Java embraces that of all the Netherlands possessions in India, as it is the entrepôt for the whole of it. It includes also a large remittance for the public revenue in the shape of produce, as coffee, sugar, indigo, tin, and spices. Java and the other Dutch possessions were delivered over by the English in 1816, with a considerably improved commerce, and certainly, at all events, with a clear field for the establishment of a liberal system. The

opportunity has assuredly not been taken advantage of. Double duties have been imposed on all goods imported under a foreign flag, and other contrivances of the exploded mercantile system have been had recourse to, in order to give trade a direction to Holland, a costly expedient, injurious to the colony, and of no substantial value to the mother country. In 1824, and within eight years after the restoration, a new East India Company was set up as one of these contrivances, the Handel Maatschappij or trading association. This association is merchant, shipowner, agent, for the sale of the government produce in Europe, carrier of this produce, and farmer of some branches of the public revenue of Java. Originally, there was guaranteed to it a fixed and certain interest on its capital stock, and even the sovereign of the Netherlands was a sleeping partner of it. The false hypothesis on which this retrograde policy was adopted, was a supposed necessity for encountering what was called the overgrown capitals and enterprise of England and America, as if the free capital and enterprise of Holland, which, under greater difficulties had achieved much greater things, was unequal to carry on the trade of its own colony without pillowing and bolstering.

The values of the exports from Java, and their destination, in 1846, 1836, and 1826, were as follows:

Countries.	1846.	1836.	1826.
	Florins.	Florins.	Florins.
Netherlands.....	89,608,848	27,232,588	6,518,525
Indian Archipelago.	9,826,548	6,708,153	4,857,788
Great Britain.....	2,865,987	189,592	349,098
China, Macao, etc.	1,886,703	3,818,706	1,976,192
France.....	1,326,149	1,944,145	42,232

Other places.....	711,868	369,315	959,735

The previous statements show that the produce and trade of Java have increased during the last 12 years with a rapidity unknown in any other colony, Cuba, perhaps, excepted; and if the resources and capabilities of this noble island be fully developed, it is quite impossible to say how much further her trade may be extended and her resources developed.

Principal Port.—Batavia, a city of the island of Java, the capital of the Dutch possessions in the East Indies, and the principal trading port of the Oriental Islands, lat. 6° 8' south, long. 106° 50' east, on the north-west coast of the island, at the mouth of the Jacatra River, on an extensive bay. The harbor lies between the main land and several small uninhabited islands, which, during the north-western monsoon, afford sufficient shelter and good anchorage. Population in 1842, 53,860, including about 8000 Europeans; the rest are Chinese, Javanese, Malays, etc. It is built on marshy ground, and intersected by canals in the Dutch style. It is defended by a citadel and several batteries, and has a considerable garrison and marine arsenal. Other authorities represent the population of Batavia, in 1832, at 118,000; viz., Europeans, 3000; Chinese, 25,000; Aborigines, 80,000; Moors, 1000; Arabs, 9000. Batavia has a bank, with branches at Samarano and Surabayo. This place was long considered very unhealthy, but has been much improved by drainage. Mean temperature of year, 78°.

The Jacatra is navigable by vessels of 40 tons two miles inland; ships of from 800 to 400 tons anchor in the bay, 1½ miles from shore. Batavia is the great commercial emporium of the Asiatic Archipelago, and absorbs by far the greatest proportion of the trade of Java and Madura; the annual exports of which islands amount to 60,300,000 florins (\$25,123,000), and the imports to 30,000,000 florins (\$12,000,000).—E. B.

See *Quar. Rev.*, vi., 487, xvii., 72; *HUNT'S Mer. Mag.*, ii., 328, xxxiii., 369; *Ed. Rev.*, xxxi., 395.

In 1853 the foreign commerce of Java and Madura amounted to \$17,712,241 for general imports, and to \$28,677,183 for exports. The imports and ex-

ports during this year exceeded those of the preceding year—the former \$1,596,164, or 9.9 per cent.; the latter \$6,294,489, or 21.83 per cent.; thus exhibiting the most practical illustration of the increasing trade of these rich and fertile islands. The share assigned to

the Netherlands in the general trade of 1853 represented, for imports, 42.23 per cent of the whole; and for exports, 76.09 per cent. The trade with the United States with these islands, during the same year, was 1.39 of the whole.

COMMERCE OF THE UNITED STATES WITH THE DUTCH EAST INDIES, FROM OCTOBER 1, 1850, TO JULY 1, 1856.

Tariff.—The tariff regulations of Java are divided into six different classes, viz.: Class 1 relates to duties on wines and spirits, etc.; class 2 relates to duties on cotton and woolen goods; class 3 relates to sundry imports from Europe, America, and the Cape of Good Hope; class 4 prescribes the duties on the products of the Indian Archipelago; class 5 relates to merchandise being the produce of countries east of the Cape of Good Hope, not included in any of the foregoing classes; class 6 prescribes the export duties levied on the products of Java. All these classes recognize a discrimination in favor of the Dutch flag; but, under the treaty of August 26, 1852, between the United States and Holland, these discriminations do not apply to the American flag when importing or exporting from or to the same places as the national flag. The article, by virtue of which the vessels of the United States are equalized with those of Holland, reads thus: Art. II. "The above reciprocal equality in relation to the flags of the two countries is understood to extend also to the ports of the colonies and dominions of the Netherlands beyond the seas, in which goods and merchandise, whatever their origin may be, imported or exported from and to any other country in vessels of the United States, shall pay no higher or other duties than shall be levied on the like goods and merchandise imported or exported from and to the same places in vessels of the Netherlands. The bounties, drawbacks, or other privileges of similar denomination, which may be there granted on goods and merchandise imported or exported in vessels of the Netherlands, shall also, and in like manner, be granted on goods and merchandise imported or exported in vessels of the United States."

From the preceding table it appears that in 1853 the United States just trebled in one year the number of vessels bearing their flag in that remote corner of the globe. This is to be ascribed to the liberal commercial treaty of 1852, equalizing the United States' and the Dutch flags in the colonial trade. The subjoined tariff of duties of the island of Java has been prepared from a copy printed at Batavia in 1844, with modifications and changes down to June, 1855, transmitted from the United States' consulate at that port:

Port Charges at Java.—The harbor dues are one half a rupee per ton; but a ship having once paid this charge can touch either at Samarang, Soerabaya, or go to a foreign port and return, if within six months from date of payment, without further expense. Ships can

anchor and remain in the roads, and can communicate with the shore, receive provisions, water, etc., without charge of anchorage fees. The roads are south of a line drawn from the Rhoneland to the Neptune shoal. All letters must be immediately delivered at the custom-house, except consignees' letters, and such as may be intended for the captain or supercargo. There are no pilots for Batavia or Samarang. For Soerabaya pilots can be had at Point Pauka coming from the west, and at Passaroeng coming from the east. Filtered water is sent alongside in government tanks, with a force-pump and hose, at a charge of 57 cents

per hogshead, and in the outer roads at 66 cents. When a blue flag is flying at the main-mast head of the guard-ship, or at the signal staff of the lookout-house at the head of the canal, it is unsafe to attempt entering the river.

Tariff of Duties for the Island of Java.—By Dutch vessels are meant vessels belonging to Holland, and no others. Under the Dutch flag are comprehended the flags of Asiatic princes which are placed on the same footing as the Dutch flag. The pound in this tariff is the old Amsterdam pound. To the duties in the tariff, 5 per cent. is added for breakwater.

DUTIES ON COTTON AND WOOLEN GOODS IMPORTED INTO JAVA.

Articles.	Rate of duty.	Remarks.
Dutch	25 per cent.	
In Dutch vessels, with certificates of Dutch origin	12½ "	On appraised value, according to tariff of prices, corrected every three months.
European and American, if from countries between which and Holland friendly relations subsist.	25 "	
From countries between which and Holland friendly relations do not subsist.	50 "	
From Dutch India and favored States in the Indian Archipelago	25 per cent.	On appraised value, according to the market price of the day.
From do, in Dutch Indian vessels, provided they have not touched at any foreign port.	12½ "	
All other countries east of the Cape of Good Hope, except Chinese goods in Chinese junks.	25 "	On invoice value, with addition of 80 per ct., or appraisement according to market prices.

IMPORT DUTIES ON SUNDRY GOODS THE PRODUCTS OF EUROPE, AMERICA, AND THE CAPE OF GOOD HOPE.

Articles.	Rate of duty.	Remarks.
Beef, salted, smoked, etc.	24 per cent.	In Dutch vessels, with certificate of Dutch origin, 12 per cent.
Books, music, maps, and charts.	6 "	
Butter	24 "	As above, free.
Cheese.	24 "	As above, one half these duties.
Candles, wax.	\$0 10 per lb.	
" spermaceti.	0 10 "	
Clothing, wool and cotton	25 per cent.	Direct from Holland in Dutch vessels, 12 p. ct.
" silk and linen	12 "	In Dutch vessels, with certificate, etc., 6 p. ct.
Copper and copper ware.	24 "	As above, 12 per cent.
Coal.	Free.	Direct from Holland, in Dutch vessels, free.
Corks.	12 per cent.	In Dutch vessels, with certificate, etc., 6 p. ct.
Carriages.	24 "	As above, 12 per cent.
Cards, playing.	24 "	As above, 12 per cent.
Cordage.	24 "	As above, 12 per cent.
Casks, new.	24 "	
Cattle, as cows, sheep, etc.	Free.	
Drugs and medicines.	12 per cent.	Direct from Holland, in Dutch vessels, 6 p. ct.
Flour.	24 "	Dutch flour packed according to the tariff of 1828, 12 per cent.
Furniture.	24 "	
Glass, china, and earthenware.	24 "	In Dutch vessels, with certificate, etc., 12 p. ct.
Gold and silver plate, lace, thread, and military ornaments.	24 "	In Dutch vessels, with certificate, etc., 12 p. ct.
Gold and silver coin.	Free.	As above, 12 per cent.
Gold and silver bullions.	"	
Hams.	24 per cent.	As above, 12 per cent.
Horses and mules.	Free.	
Hats.	24 per cent.	As above, 12 per cent.
Iron, in bars, pigs, rods, etc.	12 "	Direct from Holland, in Dutch vessels, 6 p. ct.
Iron ware and machinery.	24 "	In Dutch vessels, with certificate, etc., 12 p. ct.
Jewelry, pearls, and precious stones, set or not, if real.	Free.	
Lumber.	12 per cent.	Direct from Holland, in Dutch vessels, 6 p. ct.
Leather, and articles of leather.	24 "	In Dutch vessels, with certificate of Dutch origin, 12 per cent.
Lead.	24 "	
Linen of hemp or flax.	24 "	As above, free.
Musical instruments.	6 "	As above, free.
Naval stores, except cordage.	12 "	Direct from Holland, in Dutch vessels, 6 p. ct.
Opium, prohibited.		
Provisions, other than those named in this tariff.	24 "	Direct from Holland, in Dutch vessels, 12 p. ct.
Paper.	24 per cent.	In Dutch vessels, with certificate, etc., 12 p. ct.
Perfumery.	24 "	Direct from Holland, in Dutch vessels, 12 p. ct.
Paints, linseed oil, etc.	12 "	In Dutch vessels, with certificate, etc., 6 p. ct.
Pictures, plates, and prints.	12 "	As above, 6 per cent.
Pork, salt, smoked, etc.	24 "	As above, 12 per cent.
Steel in bars, etc.	12 "	Direct from Holland, in Dutch vessels, 6 p. ct.
Steel ware.	24 "	In Dutch vessels, with certificate, etc., 12 p. ct.
Stone for building.	12 "	As above, 6 per cent.
Marble tiles.	12 "	Direct from Holland, in Dutch vessels, 6 p. ct.
Flints, prohibited, unless especially permitted.	12 "	As above, 6 per cent.
Segars, Havana	\$0 80 per lb.	Direct from Holland, in Dutch vessels, \$0 40.
All other kinds, European and American.	0 40 "	In Dutch vessels, with certificate of origin,
Snuffs of all kinds.	0 16 "	one half these duties.
Saddles and harness (same as leather).		
Soap.	12 per cent.	Direct from Holland, in Dutch vessels, 6 p. ct.
Silver. (See Gold.)		
Silk and silk goods.	12 "	As above, 6 per cent.
Salt, prohibited.		
Tin and tin ware.	24 "	In Dutch vessels, with certificate, etc., 12 p. ct.
Tobacco leaf, manufactured.	\$0 06½ per lb.	Direct from Holland, in Dutch vessels, one half of this duty.
Tar. (See Naval stores.)		
All goods not mentioned in this tariff, the products of Europe, America, and Cape of Good Hope.	12 per cent.	As above, 6 per cent.

JAVA TARIFF—EXPORT DUTIES.

Articles.	Rate of duty.	Remarks.
Arrack.....	Free.	
Birds' nests.....	12 per cent....	Under Dutch flag, 6 per cent.
Camphor, Japan.....	\$2 80 per tub.	To Holland, in Dutch vessels, \$1 40.
Cotton goods, Japanese.....	4 per cent....	Under Dutch flag, 2 per cent.
Coffee.....	Per picol of 125 lbs., 12 p. ct.	To Holland, in Dutch vessels, 6 per cent, giving bond for the difference.
Copper, Japan.....	\$2 80 per picol	Under Dutch flag, \$1 40.
Copper coin, Dutch.....	Free.	
Gold and silver coin, by Chinese, to China.....	5 per cent....	In sums less than \$200, for owner's use, free, provided permission be obtained.
In other cases.....	4 " " " " " "	
Gold and silver not coined, and Japan cobangs.....	4 " " " " " "	
Horses.....	\$16 00 each....	Under Dutch flag, one half these duties.
Hides, cow.....	8 20 per 100....	
" buffalo.....	2 40 p. picol	To Holland, in Dutch vessels, one half these duties.
Indigo.....	4 per lb.	
Jewels, pearls, and precious stones.....	Free.	
Oil, coconut.....	\$1 20 per picol	
Ratans.....	12 " " " " " "	
Rum, Java.....	4 80 p. legger	Under Dutch flag, one half these duties.
Rice.....	4 per picol	
Spices, cloves.....	7 60 " " " " " "	
" mace.....	8 00 " " " " " "	
" nutmegs.....	7 60 " " " " " "	To Holland, in Dutch vessels, one half these duties.
" wild nutmegs.....	4 per cent....	
" pepper, black.....	30 cts per picol	
Sugar, Java, 1st and 2d sorts.....	6 per cent....	As above, free.
" brown, and molasses if, in the opinion of the collector, not suitable for export to Europe or America.....	20 cts. per picol	Under Dutch flag, free.
Salt.....	Free.	
Tortoise-shell.....	4 per cent....	Under Dutch flag, 2 per cent.
Tobacco, Java.....	4 " " " " " "	
Tin.....	\$1 60 per picol	To Holland, in Dutch vessels, 80 cents.
Triparang.....	4 per cent....	Under Dutch flag, 2 per cent.
Wax.....	4 " " " " " "	
Wood, sandal wood.....	40 ct. per picol	Under Dutch flag, one half this duty.
sapan wood.....	8 " " " " " "	To Holland, in Dutch vessels, one half this duty.
Goods not mentioned above, being the products of the Indian Archipelago.....	4 per cent....	Under Dutch flag, 2 per cent.
Goods, the maximum import duty on which is 25 or 24 per cent.....	4 " " " " " "	As above, free.
All other goods.....	4 " " " " " "	As above, 2 per cent.

Jeddo, Jedo, or Yedo, the capital of Japan, and the largest city in that empire, is situate on a gulf, on the western side of the island of Nipon, in N. lat. 35° 32', E. long. 140°. It stands on a large plain at the head of the gulf, which is here so shallow that vessels generally discharge their cargoes a league or two below the city. Jeddo is said to be 7 miles in length by 5 in breadth, and to have a circumference of 20 miles. It is not inclosed by walls, but is intersected by numerous broad canals and ditches, having on each side high embankments, on the top of which are planted rows of trees. A river of considerable size flows through the town into the harbor. The houses are small and low on account of the frequency of earthquakes. They are built of wood with thin clay walls, and are divided into rooms by paper screens. The floors are covered with mats, and the roofs with shavings of wood. Being thus entirely composed of combustible materials, fires are frequent and destructive. As the families of princes, lords, and nobility of the empire are obliged to reside continually at Jeddo, there are numerous houses of a superior class. These, however, are only one story in height, and have no towers. They are distinguished from the other houses by large court-yards, stately gates, and fine varnished steps leading up to the door. There are besides numerous temples, monasteries, and other religious buildings. The imperial palace is near the middle of the town, and is said to be more than eight miles in circumference. It consists of several palaces or castles, with large gardens and orchards. Besides being the residence of the court, Jeddo contains flourishing manufactures, and carries on an extensive commerce. The population is variously estimated from 700,000 to 1,500,000, and even more. See JAPAN.

Jeremie. This is the smallest port in the island of Hayti open to foreign commerce. The anchorage at Jeremie is so dangerous that scarcely a year passes without one or more shipwrecks, or other serious casualties, being recorded. In 1849 there entered and

cleared 76 vessels, with an aggregate of 8200 tons; and in 1850 there entered and cleared 91 vessels, measuring 11,536 tons. The following summary exhibits the general trade of this port for 1850:

Countries.	Value of imports.	Articles and quantities of exports in 1850.	Pounds.
United States.....	Francs. 1,064,000	Coffee.....	4,593,919
France.....	244,000	Cocoa.....	541,371
Great Britain.....	248,000	Campeche.....	6,429,059
Denmark.....	118,000	Guyac.....	54,500
		Wax.....	3,128

Jersey, the largest and most important of the English Channel Islands, is situate in the Bay of St. Michael, 13 miles west of the nearest coast of France, and 85 miles from the nearest point on the English coast; N. lat. (St. Helier's) 49° 11' 3'', W. long. 2° 7'. It is 12 miles in length, from east to west, and 7 in breadth from north to south, and has an area of about 40,000 acres. The north coast of the island is rocky, bold, and precipitous, rising sometimes to the height of more than 200 feet above the sea. The Channel Islands are considered as belonging to the crown, but as forming no part of the realm, so that they are not represented in Parliament; and Acts of Parliament, as such, have no legal force as regards them, unless they are therein specially named, or unless the acts, in virtue of an order of council, are registered on the records of the islands. In their institutions, customs, and laws, the people still retain much that is Norman; and, in this respect, Jersey has retained considerably more of the old institutions and of their free spirit than the sister island of Guernsey. The people appear to have at all times enjoyed much freedom and great privileges.—E. B.

Jet, or Pitch Coal (Du. *Git*, *Zwarte barnsteen*; Fr. *Jais*, *Jayet*; Ger. *Gagat*; Lt. *Gogata*, *Lustrino*; Lat. *Gagus*, *Gagates*), of a black velvet color, occurs massive, in plates; sometimes in the shape of branches of trees, but without a regular woody texture. Internal lustre shining, resinous, soft; rather brittle; easily

frangible; specific gravity 1.3. It is used for fuel, and for making vessels and snuff-boxes. In Prussia it is called black amber, and is cut into rosaries and necklaces. It is distinguished by its brilliancy and conchoidal fracture.—*THOMSON'S Chemistry.*

Jetsam. See FLOTSAM.

Jettée, the border made round the stilts under a pier, in certain old bridges, being the same with stalling; consisting of a strong framing of timber filled with stones, chalk, or other materials, to preserve the foundations of the piers from injury.

Jetty-head, a name usually given in the royal dockyards to that part of a wharf which projects beyond the rest; but more particularly the front of a wharf, the side of which forms one of the cheeks of a dry or wet dock.

Jewelry. Worn by most of the early nations. So prodigious was the extravagance of the Roman ladies, that Pliny the elder says he saw Lollia Paulina wearing ornaments which were valued at \$1,605,000. Jewels were worn in France by Agnes Sorel, in 1434. The manufacture was extensively encouraged in England in 1685. See GOLD.

Jib, a large triangular sail, between the fore-top-mast head and the boom (thence called jib-boom), which projects beyond the bowsprit.

Jidda, or **Djidda**, a sea-port town of Arabia on the Red Sea, 64 miles west from Mecca, of which it is the port; N. lat. 21° 29', E. long. 39° 15'. It stands on a gentle elevation, rising from the sea, while the surrounding country is a bare desert. Jidda, as respects cleanliness and regularity of plan, is superior to most eastern towns. The streets, though unpaved, are comparatively well laid out and wide. The houses are built of coralline stone, from the shores of the Red Sea, and from the perishing nature of this material, are not very durable. In the suburbs, the houses are mere huts constructed of reeds and bushwood.

Jidda has long been famous as the commercial emporium of Arabia, and indeed is solely dependent for its existence upon its trade. Situate about the middle of the east coast of the Red Sea, only about 120 miles distant from the opposite shore of Nubia, and within two days' journey of Mecca, it is peculiarly fitted for the importation of foreign goods as well as for the exportation of home produce. The harbor, however, like most of the other ports on the Red Sea, is inconvenient, and the entrance rather intricate. On account of the shallowness of the harbor, large ships are obliged to discharge their cargoes in the offing about two miles from the shore. The imports from Egypt and Abyssinia comprise corn, rice, butter, sugar, clothing, oil, tobacco, musk, and incense; from India, muslins, shawls, spices, and cocoa-nuts; while the Malay islands and the Mozambique coast send hither slaves. The imports are conveyed by ships to Suez, whence they find their way to the Mediterranean ports, or by caravans to Mecca and Medina, from which cities they are dispersed to Syria, Asia Minor, and Turkey. Dates, and the celebrated balm of Mecca, are brought from the interior for shipment. Next to grain, the most important article of trade is perhaps coffee, which is obtained in large quantities from Mocha. The number of vessels belonging to the port is estimated at about 250. The government of Jidda is in the hands of the Pasha of Egypt, and the town is garrisoned by Egyptian troops, amounting usually to about 400. The population is very fluctuating; the permanent population does not probably exceed 10,000, while, on the arrival of the merchant fleets, and during the feast of Ramadthan, there may be as many as 20,000 strangers within its walls.—E. B.

Jobber, a person who undertakes jobs, or small pieces of work. In some statutes, jobber is used to signify a person who buys and sells for others. See BROKER.

Jobbing is the business of a jobber.

Stock-jobbing denotes the practice of trafficking in the public funds, or of buying and selling stock, with a view to its rise or fall. The term is commonly applied to the practice of buying and selling stock for time, or of accounting for the differences in the rise or fall of any particular stock for a stipulated time, whether the buyer or seller be possessed of any such real stock or not.

Joint-stock Companies are, in England, a species of partnership in which a number of persons contribute funds or "stock" for the accomplishment of some trading or other profitable object. The peculiarity from which the term is derived is the contribution of stock apart from joint management. In an ordinary partnership the members bring more or less of their own personal management into the affairs of the company; and although, in peculiar circumstances, a partner may abstain from any interference, such a person, called in the trading world "a sleeping partner," is treated by the law in all respects as if he participated in the privileges and responsibilities of his working brethren. The distinctive peculiarity of the joint-stock company is, that their members throw their stock into the venture without directly participating in the management, which may be either in the hands of a selected number of the shareholders, or in that of persons who do not contribute at all to the undertaking. The subject thus presents considerations stretching far beyond the boundary of the mere laws affecting the rights and obligations of individual partners into the field of politics and history. It is at once obvious that these arrangements, by which the wealth of indefinite numbers can be concentrated in the hands of a few, are capable of creating a political influence which will have more or less the character of a ruling or governing power, according to the strength of the otherwise constituted authorities with which it may come in contact. It was by this sort of concentration of the wealth of many in the hands of a few that some of the religious societies of the middle ages became formidable rivals of the monarchies; the Society of the Knights Templars rising conspicuously above all others, and threatening to establish a sort of corporate empire, presiding over the European monarchies. Subsequently the Jesuits, in their government of Paraguay, afforded evidence of the power at the command of clever men regulating a common fund, which alarmed crowned heads no less than the usurping tenor of their doctrines. The great union of the Hanse Towns, before which the robber monarchies and aristocracies of central Europe fell, was again an instance of the power of concentrated wealth when measured against pure monarchical and aristocratic authority; and the expanding resources of the republic of Venice, and of other wealthy oligarchies, seemed to be raising a new ruling power which would gradually absorb and supersede the old dynasties, whether autocratic or aristocratic, by which nations were ruled. The expansion of trade by the discovery of America and a new passage to India, and still more perhaps the recasting of the political state of Europe by the Reformation, broke up these great concentrated masses, and distributed the power of collective wealth into smaller groups. Still the influence of joint-stock associations has ever, from time to time, arisen in formidable rivalry with other forms of political power, sometimes creating an effectual barrier to political oppression, but at others threatening the liberties and just rights of communities by a spirit of aggrandizement and rapacity. Perhaps the most curious single instance of a struggle between concentrated wealth and a ruling dynasty will be found in the history of Russia. The merchants of Novgorod increased in wealth and influence until they became a virtual republican government, gradually absorbing under their influence the surrounding territory. "Who can resist God and the great Novgorod?" became a saying of

the 15th century. The Grand Dukes of Muscovy commenced a systematic war against the royal company of merchants, and it seemed for some time a question whether Russia should be ruled by a commercial company or an autocracy. After many scenes of cruelty and rapacity, the latter prevailed. But the influence of Novgorod was not entirely extinguished until the foundation of St. Petersburg drew the northern trade of Russia into a new channel, where it came effectually under imperial control.

British history affords many memorable instances of the influence of joint-stock operations. It became the policy of the crown, from Queen Elizabeth's reign downward, to cherish commercial combinations, as a balance against the power of the aristocracy, and sometimes the body thus started with a stock of exclusive privileges acquired an influence dangerous alike to the authority of the crown and to the rights of the subject. The Russian Company, which had been licensed just before the accession of Elizabeth, acquired so much influence under her fostering care as to spread its transactions into Persia on the one hand, and embark in the whale fishery of Spitzbergen on the other. This potent body was in use to send ambassadors to the Grand Duke of Muscovy. But his successors, the czars, were not inclined to encourage such fellowship, and gradually enfeebled the haughty corporation by restricting its foreign privileges, and encouraging the rival company of Holland. The celebrated Turkey or Levant Company was chartered in 1581. Just 18 years afterward was formed, under far less pompous auspices, that East India Company which has been destined to rule over a greater empire than that of Julius Caesar or Charlemagne. See INDIA. Many African and American companies were formed in the 17th century, and created much excitement by their aggressions and rivalries. The Scots, excited by witnessing the enterprise and prosperity of England, in which the invidious navigation law of Charles II. prohibited them from participating, resolved to establish a great national joint-stock company for themselves. In 1695 they formed the "African Company," better known as the Darien project, subscribing a capital of four millions, the greater portion of which was paid up. This was held in its day to be a marvelous pecuniary effort for a portion of the empire which, a century and a half later, entered on railway projects involving in one year an outlay of sixteen millions. The company obtained from the Scottish Parliament more absolute power than even the great corporations of England; being authorized to hold a monopoly of certain trades, to occupy and govern territories, and to make peace and war. It commenced the execution of a variety of projects on a grand scale, and their disastrous result was a signal instance of that unscrupulous spirit of aggrandizement and oppression to which trading corporations are so liable. The Scottish company, probably, like many of the other bodies of adventurers, committed some questionable acts, but none sufficient to justify the rancorous hatred of the English rival companies, which, while the Scots were prevented, as an alien nation, from having their share in the English companies, denounced the corporation set up by the nation, which they thus counted separate and independent, for an infringement of a monopoly purely English. King William was too dependent on the moneyed power in England to hold an even balance of justice between opponents so unequally matched, and the Scottish colony was ruined.

Among the English companies of that age, several were successively established for trading with Africa and America. Their chief object and source of gain was one that would be fortunately held in detestation by the greater portion of British speculators at the present day—the supply of captured negroes to the plantations, foreign as well as British. The culmination of these projects in the great South Sea scheme

of 1719 is a well-known chapter in English history. The names of the many preposterous satellite schemes by which it was surrounded have often been cited as instances of folly calculated to tax the credulity of soberer periods, as projects in which the inhabitants of the wisest of nations actually embarked. If it were any consolation to find their neighbors guilty of greater follies than their own, the British of that age might find such consolation in a view of the French Mississippi scheme. The corporate power thus created not only professed to absorb the trade, finance, and banking of France, but projected the creation of a transatlantic empire, which, from its centre in Louisiana, should gradually absorb the American continent.

Since the passing of the Patents Act in the reign of James I., the crown alone was precluded from granting powers of trading monopoly in royal charters, and the companies which, since that period, have obtained any monopolies in England beyond those created by the simple instance of their large capital, have held their powers from Parliament. The crown continued to grant monopolies in foreign trade till 1693; when, in the celebrated question of the old East India Company, the practice was condemned by a vote of the House of Commons. A remarkable instance lately occurred of an attempt by some enterprising men to carry out a project something like that of the East India Company, independently of authority either from the crown or Parliament. It was represented that the islands of New Zealand were admirably suited for colonization, and should be immediately attached to the British colonial empire by the right of occupancy. There was, however, a strong disinclination on the part of British statesmen at that period to encumber the imperial government with the management of additional colonies. The adventurers conceived the idea of occupying the islands with independent British emigrants. The novelty of their views, and the energy and eloquence with which these were enforced, attracted a number of ardent spirits around them, who were taught that in these happy islands, possessed of all the advantages of our British climate without its drawbacks, they were to found that empire of Anglo-Saxon origin, by which the southern portion of the world was to be eventually ruled. It seemed hard that the government, declining to occupy the colonies, should discourage this project; but there were many grounds for dreading from it evil consequences, among which the most obvious and immediate was, that when the colony began slightly to prosper, it would attract the cupidity of some other European power, from which it could not be protected without an interference which might involve the British government in formidable disputes. Hence, in the year 1840, the British flag was hoisted in New Zealand, and although "The New Zealand Company" was incorporated, and afterward became the medium for the disposal of large tracts of land, its position was so humble in comparison with the splendid visions entertained by its promoters, that after a long series of intricate disputes, they resigned their charter to the government in 1850.—E. B.

The chief objects for which joint-stock companies have lately been constituted are banking, insurance, works for the supply of cities with water and gas, canals, shipping, and harbors, and, at the head of all, railways. The railway system, indeed, is the form in which both the government and the people have of late felt the pressure of joint-stock power, and known the influence of which it is susceptible. The history and effect of the railway system will be found under its proper head.

Jonk, Jonque, or Junk, in naval affairs, is a kind of small ship, very common in the East Indies. These vessels are of various dimensions; and differ in the form of their building, according to the different

methods of naval architecture used by the nations to which they belong. Their sails are frequently made of mats, and their anchors of wood.

Journal, a day-book, register, or account of what passes daily. *Journal*, in merchants' accounts, is a book in which every particular article is posted out of the waste-book, and made debtor. This is to be very clearly worded and fairly engrossed. *Journal*, in navigation, a sort of diary or daily register of the ship's course, winds and weather, together with a general account of whatever is material to be remarked in the period of a sea voyage. In all such journals, the day, or what is called the 24 hours, terminates at noon, because the errors of the dead-reckoning are at that period generally corrected by a solar observation. The daily compact usually contains the state of the weather; the variation, increase, or diminution of the wind; and the suitable shifting, reducing, or enlarging the quantity of sail extended; as also the most material incidents of the voyage, and the condition of the ship and her crew; together with the discovery of other ships or fleets, land-shoals, breakers, soundings, and the like.

Juan Fernandez, or **Mas-a-tierra**, a rocky island in the Pacific Ocean, about 400 miles off the coast of Chili, of which it is a dependency. Lat. $33^{\circ} 45'$ S., long. $79^{\circ} 2'$ W. It is 18 miles long and 6 miles broad, rises to 3,000 feet above the ocean, has steep shores, and a desolate appearance from the sea; but in its north half, in which is Cumberland Bay, are some fertile valleys, producing figs, grapes, and sandal wood, cork, and other timber trees, and it is leased from the Chilean government by settlers from the United States and Tahiti. The solitary residence here for four years of a Scotchman, named Alexander Selkirk, is supposed to have formed the basis of Defoe's well-known tale of "Robinson Crusoe." **Mas-a-fuera** is another rocky and precipitous island, lying to the west. Lat. $33^{\circ} 49'$ S., long. $80^{\circ} 27'$ W.

Juniper. The juniper-tree belongs to the natural order *Coniferae*, and is useful both for its wood and its berries. The Virginian species, which is called *red cedar*, affords a light and durable material valuable in ship-building. It attains the height of about 30 feet, and grows well in barren soil. The berries used for flavoring gin are obtained from the *Juniperus communis*, and about 200 tons of them are annually imported to this country. They are also used for imparting pungency to beer. When roasted and ground, they afford a substitute for coffee. The oil of juniper is an important ingredient in varnish for pictures, wood-work, etc. The berries have also a diuretic property, and are used in medicine. The heavy duty to which they were subject in England was abolished in 1845.

Junk, in nautical language, a name given to any remnant or piece of old cable, which is usually cut into small portions, for the purpose of making points, mats, gaskets, sennets, and the like. See **JONK**.

Jute. Jute is a remarkably beautiful fibre—soft, silky, and easily spun; and if to its other advantages were added those of strength and durability, it would probably supersede all other fibrous materials. But it is as rapid in its decay as in its growth, and is, in reality, the most perishable of fibres. From the period of its first production in the clear state, it slowly, and of its own accord, changes its color, losing the beautiful pearly white, which at first distinguishes it, and assuming successive shades of fawn-color and brown. At the same time, its strength proportion-

ately diminishes. Circumstances hasten or retard this decay, and moisture is particularly injurious to it. High-pressure steam almost melts it away, so that when sail-cloth, adulterated with jute, is submitted to high-pressure steam (of only 30 lbs. pressure), for four hours, mere washing afterward removes the jute. It is believed that an improvement in the process of setting would increase both its strength and durability; but it is very doubtful if it can ever be rendered equal in these respects to either hemp or flax.

The extent of the foreign traffic which has already been established in this fibre, notwithstanding its imperfections, may be judged of from the fact, that in the years 1850 and 1851, the quantity of jute exported from Calcutta alone was valued at 2,000,000 rupees, or £200,000, and the jute or gunny-cloth at an equal sum, and that it has already obtained a considerable place among the raw materials employed in manufactures.—P. J. of T. See **HEMP**.

According to Braithwaite's "Commerce of Liverpool," 100,000 bales of jute are used annually in England, valued at £20 per bale. The grass is sent to Dundee and other places, and the fibre so resembles caterpillar's thread, that it is used to adulterate silk. It is made into coverings, called "baggings," for cotton bales; and, after various uses, finds its way to the paper-mill, for the manufacture of coarse wrapping-papers.—**HEREPATH'S Journal**.

This article is now largely introduced in the manufactures of England. It much resembles a coarse flax, having a long fibry texture, and when dyed has a very woolly appearance. In and around Dundee, Scotland, there are no fewer than 76 mills, all engaged, spinning this jute and flax—the principal of which is said to be the largest mill in Scotland. There are in this mill some 2000 hands, all wholly employed spinning jute, which is used to a large extent in the manufacture of carpets and rugs. Some three houses in that quarter dye for this branch of trade alone about seven tons a day. The carpets are sold as low as from 7d. to 11d. per yard; the rugs again as low as 8s. sterling. Jute can be spun to a very fine thread. It might be turned to a good account in the shawl trade, as a substitute for cotton. In its unmanufactured state it is said only to cost 11s. per cwt.; a very great contrast to the very coarsest wool—at least 1s. per pound in its oily state.

Jury-mast. In naval affairs, a temporary mast erected in a ship in the room of one that has been carried away by tempest or any other accident. Jury-masts are sometimes erected in a new ship to navigate her down a river, or to a neighboring port, where her proper masts are prepared for her.

Jury Trial, the most thoroughly expressive feature in the administration of modern justice, is, in its essential principle, nothing more than the citizen's right to have the judgment of an impartial committee of his fellow-citizens on any question of fact tending to affect his life, his liberty, or some important patrimonial interest. The origin of the practice has been traced by juridical antiquaries into many and far diverging sources, but they have all been found converging in one direction, by the influence of a common determination, which seems to have ever guided the purpose of the Anglo-Saxons and some other northern races in the practical application of such existing institutions as could be influenced to the end in view. See *North Brit. Rev.*, viii., 44; *Quar. Rev.*, lvii., 177; *Dem. Rev.*, vi., 463; **BLACKWOOD**, xxvii., 736; *Knicker.*, xv., 478, xviii., 247; *NILES'S Reg.*, xiii., 189.

K.

Kaleidoscope. This optical instrument, which combines mirrors, and produces a symmetrical reflection of beautiful images, was invented by Dr. Brewster of Edinburg; it was first suggested in 1814, and the instrument perfected in 1817, after which large numbers were manufactured. It is intended to assist jewelers, glass-painters, and other ornamental artists, in the formation of patterns, of which it produces an infinite number. See BLACKWOOD, iii.

Kane, Elisha Kent, the Arctic explorer, was born in Philadelphia on the 3d of February, 1822, and graduated at the University of Pennsylvania in 1843, first in the college and subsequently in the medical department; and when he started upon his active career of adventure, he was esteemed a good classical scholar, and a good chemist, mineralogist, astronomer, and surgeon. His frame, even in boyhood, was delicate, and, with a view of strengthening his constitution, he solicited an appointment in the navy as surgeon, and obtained it, and was attached to the first American embassy to China. This position gave him an opportunity to explore the Philippine Islands, which he effected mainly on foot. He was the first man who descended into the crater of Tael, lowered more than 100 feet by a bamboo rope from the overhanging cliff, and clambering down some 700 more through the scoriae, he made a topographical sketch of the interior of this great volcano, collected a bottle of sulphurous acid from the very mouth of the crater, and, although he was drawn up almost senseless, he brought with him a sketch of this hideous cavern and the specimens which it afforded. Before returning home from this expedition he had ascended the Himalayas, visited Ceylon, the upper Nile, and all the mythological regions of Egypt—traversing the route and making the acquaintance of the learned Lepsius who was then prosecuting his archeological researches. He also traversed Greece on foot, and returned to the United States through Europe. Soon after his arrival he was again ordered on duty—this time to the western coast of Africa. He now attempted to visit the slave marts of Whydah, but having taken the African fever, he was sent home in a precarious state of health. He recovered, however, and we next find him a volunteer in the Mexican war. His adventures in Mexico proved him to be the possessor of lion-like courage, and of a most generous and noble heart; but he fell a victim to one of the fevers of the country, and was very near dying. When he recovered and returned, he was employed in the Coast Survey department, from which he was transferred by the Secretary of the Navy to the post of surgeon on the Grinnell Arctic expedition. His history of that expedition gave him a high position as an author. Not yet satisfied, however, he scarcely gave himself time to recover from the hardships of that cruise, before he set on foot the second Grinnell or Kane expedition, the results of which have been pronounced by the highest European authorities as among the wonders of the present century. Dr. Kane died of consumption, at Havana, February 16th, 1857. See *Arctic Explorations and Life of Kane*.

Kansas Territory extends from the 37th degree of north latitude to 40 degrees north, and from the west boundary of Missouri to the crest of the Rocky Mountains. Area, 122,000 square miles. Drained by the main branch of the Arkansas, by the Kansas, and by head branches of the south fork of Platte or Nebraska River. Surface level, consisting of an immense plain, with a gentle slope from the base of the Rocky Mountains to the Missouri border, and the abrupt descent from the mountain ridge to the base of about 75 miles in width. The soil is various, rich alluvial bot-

tom lands bordering the streams, some fertile prairie lands and extensive sandy plains, but these are of sufficient fertility to furnish nourishment to immense herds of the American bison. It was formed into a Territory by the act of Congress of May, 1854, together with the Territory of Nebraska.

Kedge, a small anchor used to keep a ship steady while she rides in a harbor or river, particularly at the turn of the tide, when she might otherwise drive over her principal anchor, and entangle the stock or flukes with her stack cable, so as to loosen it from the ground. This is accordingly prevented by a kedge rope that hinders her from approaching it. The kedges are particularly useful in transporting a ship; that is, removing her from one part of the harbor to another, by means of ropes, which are fastened to these anchors. They are generally furnished with an iron stock, which is easily displaced for the convenience of stowing them.

Keel, the principal piece of timber in a ship, which is usually first laid on the blocks in building. By comparing the carcass of a ship with the skeleton of the human body, the keel appears as the back-bone, and the timbers as the ribs. The keel supports and unites the whole fabric, since the stem and stern posts, which are elevated on its ends, are, in some measure, a continuation of the keel, and serve to connect and inclose the extremities of the sides by transoms, as the keel forms and unites the bottom by timbers. The keel is generally composed of several thick pieces placed lengthways, which, after being scarfed together, are bolted and clinched upon the upper side.

False Keel, a strong thick piece of timber, bolted to the bottom of the keel, which is very useful in preserving its lower side. The false keel is provided when the thick pieces which form the keel can not be procured large enough to give a sufficient depth thereto. In large ships of war the false keel is composed of two pieces, called the *upper* and *lower* false keels. The lowest plank in a ship's bottom, called the *garboard streak*, has its inner edge let into a groove or channel, cut longitudinally on the side of the keel. The depth of this channel is therefore regulated by the thickness of the garboard streak.—E. A.

Keel-hauling, a punishment inflicted for various offenses in the Dutch navy. It is performed by suspending the culprit by a rope from one yard-arm, with a weight of lead or iron upon his legs, and having another rope fastened to him, leading under the ship's bottom, and through a block at its opposite yard-arm. He is then suddenly let fall from the one yard arm into the sea, where, passing under the ship's bottom, he is hoisted up on the opposite side of the vessel to the other. This punishment is not altogether unknown in British ships; but, as it is dangerous, it is very rarely, or, indeed, scarcely ever, now practiced.

Keelson, or **Kelson**, a piece of timber forming the interior or counterpart of the keel, being laid upon the middle of the fore-timbers immediately over the keel, and serving to bind and unite the former to the latter, by means of long bolts driven from without, and clinched on the upper side of the keelson. The keelson, like the keel, is composed of several pieces scarfed together; and, in order to fit with more security upon the floor-timbers and crotchets, it is notched about an inch and a half deep opposite to each of those pieces, thereby scored down upon them to that depth, where it is secured upon them by spike-nails. The pieces of which it is formed are of only half the breadth and thickness of those of the keel.—E. A.

Kelp, a substance composed of different materials, of which the fossil or mineral alkali, or, as it is com-

monly termed, soda, is the chief. This ingredient renders it useful in the composition of soap, in the manufacture of alum, and in the formation of crown and bottle glass. It is formed of marine plants, which, being cut from the rocks with a hook, are collected and dried on the beach to a certain extent; they are afterward put into kilns prepared for the purpose, the heat of which is sufficient to bring the plants into a state of semi-fusion. They are then strongly stirred with iron rakes; and when cool, condense into a dark blue or whitish mass, very hard and solid. Plants about three years old yield the largest quantity of kelp. The best kelp has an acrid caustic taste, a sulphurous odor, is compact, and of a dark-blue greenish color. It yields about 5 per cent. of its weight of soda.—BARRY'S *Orkney Islands*; THOMSON'S *Dispensatory*. The manufacture of kelp in Great Britain, is, or rather was, principally carried on in the Western Islands, and on the western shores of Scotland, where it was introduced from Ireland, about the middle of last century. Toward the end of the year 1815, the kelp shores of the island of North Uist let for £7000 a year. It has been calculated that the quantity of kelp annually manufactured in the Hebrides only, exclusive of the mainland, and of the Orkney and Shetland Isles, amounted, at the period referred to, to about 6000 tons a year, and that the total quantity made in Scotland and its adjacent isles, amounted to about 20,000 tons. At some periods during the war, it sold for £20 a ton; but at an average of the 23 years ending with 1822, the price was £10.—ART. SCOTLAND, *Edinburg Encyclopedia*. Unluckily, however, the foundations on which this manufacture rested were altogether factitious. Its existence depended on the maintenance of the high duties on barilla and salt. Inasmuch, however, as kelp could not be substituted, without undergoing a very expensive process, for barilla, in a great many departments of industry in which the use of mineral alkali is indispensable, it became necessary materially to reduce the high duty in Great Britain on barilla during the war. The ruin of the kelp manufacture has been ascribed to this reduction; but though barilla had been altogether excluded from the markets which could not have been done without great injury to many most important manufactures, the result would have been perfectly the same, in so far as kelp is concerned, unless the high duty on salt had also been maintained. It was the repeal of the latter that gave the kelp manufacture the *coup de grace*. The purification of kelp, so as to render it fit for soap-making, is a much more troublesome and expensive process than the decomposition of salt; and the greatest quantity of alkali used, is now obtained by the latter method. The manufacture is now almost extinct. Shores that formerly yielded the proprietors a rent of £200 to £500 a year, are now worth next to nothing. The price of kelp since 1822 has not been, at an average, above £4 a ton; and the article will, most probably, soon cease to be produced.

This result, though injurious to the proprietors of kelp shores, and productive of temporary distress to the laborers employed in the manufacture, is not to be regretted. It could not have been obviated, without keeping up the price of some of the most important necessities of life at a forced and unnatural elevation. The high price of kelp was occasioned by the exigencies of the late war, which, besides obstructing the supply of barilla, forced government to lay high duties on it and on salt. The proprietors had not the vestige of a ground for considering that such a state of things would be permanent; they did right in profiting by it while it lasted; but they could not expect that government was to subject the country, during peace, to some of the severest privations occasioned by the war, merely that they might continue to enjoy an accidental advantage.

Kelp is chiefly used in the United States as a ma-

nure, and for this purpose is very valuable. Large quantities are thrown on the beaches after a storm, and the Gulf Stream constantly brings it to our shores, from whence it is carted by our farmers to their fields, and allowed to decompose.

Kentledge, the name sometimes given to the iron pigs cast in a particular form for ballasting ships, and employed for that purpose.

Kentucky, one of the central United States, is situated between 36° 30' and 39° 10' north lat. and between 82° and 89° 40' west long. Its length is about 400 miles, and its breadth 170 miles, containing 37,680 square miles. Population in 1790 was 73,667; in 1800, 220,959; in 1810, 406,511; in 1820, 564,317; in 1830, 688,844; in 1840, 779,823, and in 1850, 982,405. The State is divided into 100 counties.

Surface, Soil, etc.—A tract from 5 to 20 miles wide along the Ohio River, through the whole length of the State, is hilly and broken, but has a fertile soil. The margin of the Ohio for about a mile in width, consists of bottom lands, which are overflowed when the river is high. Between this tract of hilly country the more mountainous eastern counties and Green River is a fertile tract, frequently denominated the garden of the State. It is about 150 miles long, and from 50 to 100 wide. The soil is excellent, the surface gently undulating, and the forest-growth, black-walnut, black-cherry, buckeye, paw-paw, sugar-maple, mulberry, elm, ash, cotton-wood, white thorn, and an abundance of grape-vines. The country in the south-west part of the State, between Green and Cumberland Rivers, is called the "barrens." In 1800 the legislature of the State made a gratuitous grant of this tract to actual settlers, under the impression that it was of little value, but it proves to be excellent grain-land, and also adapted to the raising of cattle and swine. The whole State below the mountains, has, at the usual depth of eight feet, a bed of limestone which has frequent apertures through which the waters of the rivers sink into the earth, causing some of them to disappear for a time, and others to be greatly diminished in the summer season. The rivers have generally worn deep channels in the calcareous rocks over which they flow. The precipices formed by the Kentucky are in many places stupendous, presenting perpendicular banks of solid limestone 300 feet high, above which is a steep and difficult ascent several times as high. In the south-west part of the State, between Green and Cumberland Rivers, are several remarkable caves. One called the Mammoth Cave, 180 miles from Lexington, on the road to Nashville, has been explored for a distance of eight or ten miles. Iron ore and coal, are widely diffused, coal especially occupies an extensive field. Salt springs are numerous, and mineral springs are found in many localities. There were in this State in 1850, 5,968,270 acres of land improved, and 10,981,478 of unimproved land in farms; cash value of farms, \$155,031,262, and the value of implements and machinery, \$5,169,037; live stock—horses, 315,682; asses and mules, 65,609; milch cows, 247,475; working oxen, 62,274; other cattle, 442,763; sheep, 1,102,091; swine, 2,891,163; value of live stock, \$29,661,436.

Agricultural Products, etc.—Wheat, 2,142,822 bushels; rye, 415,073; Indian corn, 58,672,591; oats, 8,201,311; barley, 95,343; buckwheat, 16,097; peas and beans, 202,574; potatoes, 1,492,487; sweet potatoes, 998,179; value of products of the orchard, \$106,230; produce of market gardens, \$303,120; pounds of butter made, 9,947,523; of cheese, 213,954; sugar, 284 hhds.; maple sugar, 437,405 pounds; molasses, 30,079 gallons; beeswax and honey, 1,158,019 pounds; wool, pounds produced, 2,297,433; cotton, 758; flax, 2,100,116; silk cocoons, 1201; hops, 4309 pounds; tobacco, 55,501,196; hay, tons of, 113,747; hemp, 16,432 tons; clover seed, 3230 bushels; other grass seeds, 21,481; flax seed, 75,801 bushels; and were made 8093 gallons of wine; value of slaughtered animals, \$6,462,598.

The Ohio River, by its various windings, borders this State on the north for 637 miles. Cumberland and Tennessee Rivers pass through its western part as they approach their entrance into the Ohio. Cumberland rises in the eastern part of this State. The Big Sandy is 260 miles long, and for a considerable distance forms the boundary between this State and Virginia. It is navigable 50 miles for boats. The Kentucky River rises in the Cumberland Mountains, and after a course generally through a deep rocky bed, falls into the Ohio 77 miles above Louisville. It is navigable for steamboats 60 miles to Frankfort. Licking, Green, and Salt, are other considerable rivers. The Mississippi runs on the western border. Tonnage of the State, January, 1853, 12,166, composed entirely of steamboats.

Manufactures, etc.—There were in this State in 1850, 8 cotton factories, with a capital invested of \$541,000, employing 206 males and 307 females, producing 1,078,084 yards of sheeting, etc., and 725,000 pounds of yarn, valued at \$440,095; 27 woolen factories, with a capital of \$260,320, employing 289 males and 81 females, manufacturing 878,034 yards of cloth, valued at \$424,544; 24 establishments making pig iron, with a capital of \$1,027,500, employing 1922 persons, producing 28,609 tons of pig iron, etc., the entire value of products, \$629,937; 20 establishments, with a capital of \$502,200, employing 578 persons, and making 5888 tons of castings, etc., valued at \$744,316; 4 establishments, with a capital of \$176,000, employing 183 persons in manufacturing 3070 tons of wrought iron, valued at \$299,700; 320 flouring and grist-mills 362 saw-mills, and 890 tanneries; 51 printing offices, 9 daily, 5 tri-weekly, 2 semi-weekly, 88 weekly, 1 semi-monthly, and 7 monthly publications; total copies printed annually, 6,582,838.

There were in this State January 1857, 33 banks, with a capital of about \$12,000,000. There were in operation January, 1856, 233 miles of railroad, and 452 miles in course of construction.

The foreign commerce of Kentucky is very small. Effort is being made to increase it, and also the foreign commerce of some of the other western States, by giving facilities for the direct importation of goods. At several of the western cities, fine custom-houses have been built; at St. Louis and Cincinnati, and at others, Louisville and Dubuque, it is proposed to erect them. There are no records of the foreign commerce of Kentucky prior to 1835. Since that time it has been as follows:

FOREIGN COMMERCE OF KENTUCKY.

Years.	Exports. Domestic.	Imports.	District Tonnage. Enrolled.
Sept. 30, 1835, to Sept. 30, 1840.	\$3,723	\$39,435	In 1836.... 1,714
Sept. 30, 1840, to June 30, 1850.	390,885	" 1841.... 8,359
July 1, 1850, to July 1, 1853...	574,493	" 1851....12,989

Kepler, John. This eminent man, known in the annals of astronomical science as discoverer of the laws of motion of the planetary bodies which compose the solar circle, was the son of a military officer, and was born at Weil, Duchy of Wirtemberg, 27th December, 1571. In 1591 he became the pupil of Michael Mastlins, under whom he made great progress as a mathematician. Having added divinity to his studies, he acquired considerable celebrity as a preacher; but, relinquishing the clerical gown, he succeeded, in 1594, in obtaining the mathematical chair in the university of Gratz, in Styria. In 1598, having professed the Protestant faith, he was removed from his office, but was soon recalled again by the States. In 1600 he accepted an invitation from Tycho, urging him to settle at Prague, and assist him in the prosecution of astronomical researches, under the patronage of the Emperor Rodolph. The death of Tycho, and Kepler's own illness almost immediately on his arrival in Prague, prevented the desired co-operation; but on his introduc-

tion to the emperor, he was requested to complete the tables his late friend had begun, which were to be called the *Rodolphine Tables*. This work, which occupied him during the greater part of the remainder of his life, he carried on and completed in 1627, amid the inconveniences and difficulties which arose from the irregular payment of his pension, and the other expenses attending the undertaking. His health now again failed, and as a means of restoration, together with the desire of obtaining the arrears due him by the emperor, he went to Ratisbon; but the fatigue of traveling and mental uneasiness threw him into a sickness which closed his life, soon after his arrival in that city, in November, 1630. His published works on astronomical subjects are numerous, besides which he wrote on chronology, geometry of solids, trigonometry, logarithms, and dioptries. To this great philosopher the world is indebted for the discovery of the true figure of the orbits of the planets, which he demonstrated to be ellipses, together with those principles of planetary motion generally denominated "the laws of Kepler."

Kermes (Ger. *Scharlachbeeren*; Du. *Grein Scharlakenbessen*; It. *Grana*, *Chermes*, *Cremese*, *Cocchi*; Sp. *Grana Kermes*, *Grana de la coscoja*), an insect (*Coccus illicis* Lin.) of the same species as the true Mexican cochineal, found upon the *quercus ilex*, a species of oak growing in Spain, France, the Levant, &c. Before the discovery of America, kermes was the most esteemed drug for dyeing scarlet, and had been used for that purpose from a very remote period. Beckmann inclines to think that it was employed by the Phœnicians, and that it excelled even the famous Tyrian purple. (*Hist. of Invent.*, vol. ii., p. 197, Eng. ed.) From the name of *coccus* or *coccus*, cloth dyed with kermes was called *coccinum*, and persons wearing this cloth were said by the Romans to be *coccinati*. (*Mart.*, lib. i., epig. 97, lin. 6.) It is singular, however, notwithstanding its extensive use in antiquity, that the ancients had the most incorrect notions with respect to the nature of kermes; many of them supposing that it was the grains (*grana*) or fruit of the *ilex*. This was Pliny's opinion; others, after him, considered it in the same light, or as an excrescence formed by the puncture of a particular kind of fly, like the gall-nut. It was not till the early part of last century that it was finally and satisfactorily established that the kermes is really nothing but an insect, assuming the appearance of a berry in the process of drying.—The term kermes is of Persian origin. The Arabians had been acquainted with this production from the earliest periods in Africa; and having found it in Spain, they cultivated it extensively as an article of commerce, as well as a dye drug for their own use. But since the introduction of cochineal, it has become an object of comparatively trifling importance. It is still, however, prepared in some parts of Spain. Cloths dyed with kermes are of a deep red color; and though much inferior in brilliancy to the scarlet cloths dyed with real Mexican cochineal, they retain the color better, and are less liable to stain. The old tapestries of Brussels, and other places in Flanders, which have scarcely lost any thing of their original vivacity, though 200 years old, were all dyed with kermes. The history of this production has been treated with great learning by Beckmann (*Hist. of Invent.*, vol. i., pp. 171-191, 1st ed. trans.); and by Dr. Bancroft (*Permanent Colors*, vol. i., pp. 393-409).

Kersey (probably a corruption of Jersey, whence it originally came), a kind of coarse cloth, usually ribbed, and woven from long wool. It is chiefly manufactured in the north of England. *Kerseymere*, on the other hand, is a thin stuff, generally woven plain from the finest wools; and hence it has been inferred that these two terms, whose meaning is so distinct, can not be referred to the same origin. *Kerseymere* is said to have derived its appellation from Cashmir, a country which produces the finest wool, and is consequently

most celebrated for the works of its looms. In England it is principally manufactured in the western district.

Ketch (It. *caicchio*), an old English term applied to a vessel equipped with two masts, and from 100 to 250 tons burden. It was nearly synonymous with the modern term *yacht*, being used chiefly by ambassadors or other distinguished personages in voyages from one place to another, and was furnished with all the apparatus necessary for defense or aggression.

Keys. The invention of them is ascribed to Theodore, of Samos, by Pliny, about 780 B. C. But this is an error, as keys are mentioned in the siege of Troy, 1193 B. C. Keys were originally made of wood, and the earliest form was a simple crook similar to the common picklock now in use. The ancient keys now to be found in the cabinets of the curious are mostly of bronze. The late Francis Douce, Esq., had some of remarkable shapes, the shaft terminating on one side by the works, on the other by a ring. Keys of this description were presented by husbands to wives, and were returned again upon divorce or separation.

Keys are certain sunken rocks lying near the surface of the water, particularly in the West Indies, from the Spanish *cayo* (an islet rock). The keys, so called, off the Florida coast, are prolific in wrecks of the larger class of vessels. For an account of these wrecks, see articles **KEY WEST, FLORIDA,** and **WRECKS.**

Key-West, a small island from four to five miles in length, by one in width; 56 miles south-west from Cape Sable, in Florida. It is one of the Florida keys, or of that extensive circular range of low islands, banks, and reefs, which fences the coast of Florida, and forms the northern boundary of the Gulf Stream, from the Tortugas islands on the west round to Cape Florida on the north. A light-house erected on the south-west point of the island, lat. $24^{\circ} 32' 32''$ N., long. $81^{\circ} 48' 30''$ W., has a fixed light elevated 67 feet above the level of the water. The town of Key-West, near the north-west part of the island, has about 1600 inhabitants, and has an excellent harbor, with about 25 feet of water. A safe passage, about six miles in length, leads by Key-West from the Gulf Stream to the Gulf of Mexico. It has 12 feet of water at ebb tide, and vessels from the north bound for New Orleans, Mobile, etc., or from the latter for the former, by passing through it, avoid the delay and danger of the more westerly passage round the Tortugas. Owing to the frequent accidents to shipping from coming in contact with the banks and reefs in this dangerous vicinity, the American government has organized an establishment at Key-West for the assistance of ships in distress, and made it the seat of an admiralty court for the adjudication of claims for salvage. The former consists of above 20 licensed vessels, with crews of about 10 men each. These are kept constantly cruising about on the look-out for ships in distress or wanting pilots; and as their emolument principally depends on the fees they obtain for their assistance, it may be fairly assumed that it will be rendered with the greatest alacrity. But the desirable thing is to hinder vessels from getting on shore, the assisting them when in that predicament being, though an important, a secondary consideration. The latter, however, and not the former, is the main object which the licensed cruisers of Key-West have in view; and it would be preferable, could means be devised for making their remuneration depend rather on their success in preventing disasters, than, as at present, in mitigating their influence. This, however, is by no means easily done. Shipwrecks will, perhaps, be more effectually prevented by increasing the number of light-houses, light-vessels, and sea-marks along the edges of the islands and reefs, than in any other way. We subjoin an account of the sums awarded as salvages by the court of Key-West, in each of the 16 years ending with 1851. These, though of small amount,

show a general uniformity, making it probable that they are from local causes.

See **BLUNT'S American Pilot;** **DEBOW'S Industrial Resources;** *Account of Light-houses, U. S., in 1850.*

Kiakhta, a Russian settlement of more than a century old, a little to the south of Lake Baikal, and constitutes, with the Chinese frontier town Maimachen (which is in immediate juxtaposition), the emporium through which the whole of the overland tea for Russia passes, and it is from this fact that this place acquires its present importance. It is by this channel that the article originally reached western Europe; and if all intercourse with the Chinese seaboard were stopped, by this channel only would all consumers, not only in Europe, but in America also, be able to obtain it. The whole tea-drinking world would have to content itself with obtaining from St. Petersburg what supplies it could, after it had been brought a distance of nearly 8000 miles by land transport and river navigation. The cost of transit is such that before the late war with Russia scarcely anything was drunk throughout the whole kingdom of Poland but smuggled Canton tea, which was every year penetrating further and further into the interior of Russia, as will be believed, when it is stated that the average wholesale price of the common tea was 270 copecks (\$2 10) and of the best 410 copecks (\$3 28) at Moscow in the year 1854. To what price it would reach, were the demand suddenly increased to any great extent, is mere conjecture. One thing is plain—it would deprive not merely the common people, but the great bulk of the middle class, of all participation whatever in this great necessity.

The duties on this overland tea form an important item in Russian finance. A most serious diminution in them was occasioned by the treaty with China which threw open the northern ports. In 1842 no less than 467,679 poods of Chinese merchandise, the far greater part of it being tea, left Kiakhta; in 1854 little more than half as much. If a perfectly free intercourse with the interior of China were allowed, the Kiakhta trade would be proportionably diminished; and it is quite conceivable that it would even be superseded altogether, except as regards the so-called "brick-tea"—a compost of tea-leaves and sheep's blood, in which the Mongol palate exclusively delights. This inference is drawn confidently from the positive statement of the Russian statist, M. Tengoborskii, that the Kiakhta tea costs 20 copecks the pound in transport before it even reaches the emporium; whereas the same article from the same dépôt may be taken to Shanghai for only 8 copecks, and all the way to London for 10. It is plain, therefore, that the question of open or closed ports in China is the question between the annihilation of the Russian revenue from tea, and the compelling of the consumers of the commodity throughout the world to enrich the Russian treasury by purchasing a tithe of their requirements at tenfold the price they need pay for an ample supply.

The only country which has an interest in sealing the Chinese seaboard is likewise the only one which enjoys, and has long enjoyed, the privilege of being represented at Peking. Ever since the year 1727 the Russian government has maintained an establishment in that capital, the members of which are changed regularly every 10 years. It originally professed to be for the spiritual behoof of the descendants of some Siberian settlers who had been carried off about half a century before from the upper valley of the Amoor,

but the mission still continues, although the necessity has ceased; and, while authentic information relative to the resources and the administration of the Celestial Empire is derived through this channel by the foreign office at St. Petersburg, no doubt whatever opinions are current at Peking of the powers of western Europe owe their shape and color to the same agency.—*London Times*.

Kidderminster, a manufacturing town of England, county Worcester, on the Oxford, Worcester and Wolverhampton railroad, and on both sides of the Stour, near its confluence with the Severn, 15 miles north of Worcester. Population, 18,462. Kidderminster was noted for its woollen manufactures in the reign of Henry VIII. The fabrics now made are carpets and finger rugs, with some bombazines, button coverings and waistcoat pieces. The carpets are unrivaled for excellence of workmanship at the low prices charged. In 1838, upward of 2000 looms, and 4000 hands, were employed in this manufacture. The Stafford and Worcester canal passes the town, and opens a communication with Liverpool, Hull, and Bristol. The Kidderminster and Scotch carpets are woven on the principle of damask patterns, all being wool, and the patterns being effected by arranging and interchanging two colors, so that while one predominates on one side, the other pattern shows itself on the other side. They have little substance, and soon wear out; their low price being their only advantage. They are made in widths of a yard, and are sold at about 3s. sterling per yard, or sometimes even below that price.

Kidney Beans, or **French Beans**, were introduced into England about A.D. 1633. The kidney bean-tree (*Glycine frutescens*) was brought to that country from South Carolina about the year 1724, though some authorities say earlier. Kidney beans are a summer pulse, and are of peculiar delicacy early in the season. They are much esteemed, both in this country and in England.

Kilogramme. In France, the unit used in weighing is the gramme, which has been fixed by law, and is equal to the specific weight of the distilled water contained in one cubic centimetre. The gramme thus fixed weighs 15.433 grains Troy and 16.924 grains avoirdupois, while the kilogramme, which consists of 1000 grammes, is found to be equal to 2 livres (pounds) 5 gros, 35 grains—15.100ths poids de marc—and to 2 pounds, 8 ounces, 3 pennyweights, 6.355 grains Troy, or 2 pounds, 3 ounces, 4 dramchans, 16 grains avoirdupois weight English. As the most common things of daily consumption are sold by weights in small quantities, a great difficulty arose in introducing this part of the system; and the old denominations of weights have therefore been allowed to remain, with some modification in their actual value, taking the kilogramme as the basis. The kilogramme is divided into 2 livres, the livre is subdivided into 16 ounces, the ounce into 8 gros, and the gros into 72 grains. The new livre, therefore, exceeds the old one (poids de marc) by 2.100ths; so, to reduce kilogrammes into old measure, it is necessary to multiply by 2 and add 2.100ths. In the decimal system adopted in France, the prefixes for multiplying are Greek, and for dividing are Latin. Thus:

Deca means	10 times.	Deci means	10th part.
Hecto "	100 "	Centi "	100th "
Kilo "	1,000 "	Milli "	1,000th "
Myria "	10,000 "		

We have, therefore, the milligramme, centigramme, decigramme, GRAMME, decagramme, hectogramme, kilogramme, and myriagramme, as the names of the various weights.

Kino (Fr. *Gomme de Kino*; Ger. *Kinoharz*; It. *Chino*), a gum, the produce of trees that grow in the East and West Indies, Africa, Botany Bay, etc. The kino now found in the shops is said by Dr. A. T.

Thomson to come from India, and to be the produce of the *nauclea gambir*. The branches and twigs are bruised and boiled in water. The decoction is then evaporated until it acquires the consistence of an extract, which is kino. It is imported in chests containing from 1 to 2 cwt.; and on the inside of the lid of each chest is a paper, inscribed with the name of John Brown, the month and year of its importation, and stating that it is the produce of Amboyna. It is inodorous, very rough, and slightly bitter when first taken into the mouth; but it afterward impresses a degree of sweetness on the palate. It is in small, uniform, deep brown, shining, brittle fragments, which appear like portions of a dried extract broken down; being perfectly uniform in their appearance. It is easily pulverized, affording a powder of a lighter brown color than the fragments. But it may be doubted whether the inspissated juice of the *nauclea gambir* ought to be considered as kino. Dr. Ainslie says that Botany Bay kino is the only kind he had seen in an Indian bazaar. The tree which yields it grows to a great height: it flows from incisions made into the wood of the trunk.—Thomson's *Dispensatory*; AINSLIE'S *Materia Indica*.

Knee, in a ship, a crooked piece of timber, having two branches or arms, and generally used to connect the beams of a ship with her sides or timbers. The branches of the knees form an angle of greater or smaller extent, according to the mutual situation of the pieces which they are designed to unite.

Knee of the Head, a large, flat piece of timber, fixed edgewise upon the fore part of a ship's stem, and supporting the ornamental figure or image placed under the bowsprit. The *knee of the head* is a phrase peculiar to shipwrights, as this piece is always called the *cut-water* by seamen, if we except a few, who, affecting to be wiser than their brethren, have adopted this expression, probably on the presumption that the other is a cant phrase or vulgarism.

Carling-Knees, in a ship, those timbers which extend from the ship to the hatchway, and bear up the deck on both sides.

Knives (Ger. *Messer*; Du. *Messen*; Fr. *Couteaux*; It. *Coltelli*; Sp. *Cuchillos*; Rus. *Noshi*) well known utensils made of iron and steel, and employed to cut with: they are principally manufactured in London and Sheffield. Knives are made for a variety of purposes, as their different denominations imply; such as table-knives, pen-knives, oyster-knives, pruning-knives, etc. Although England at present excels every part of the world in the manufacture of knives, as in most branches of cutlery, the finer kinds were imported until the reign of Elizabeth. It is stated by Mr. Macpherson (*Annals of Com.*, A.D. 1563), that knives were not made for use in England till 1563; but there can be no doubt that this is an error. They had been made, though probably of a rude and clumsy pattern, for centuries before, in the district called Halamshire, of which Sheffield is the centre; the cutlers of London were formed into a corporation in 1417.—*Manufactures in Metal*, in LARDNER'S *Cyclopædia*. See **HARDWARE** and **CUTLERY**. Forks were in use on the Continent in the 13th and 14th centuries.—VOLTAIRE. This is reasonably disputed, as being too early. In FYNES MORYSON'S *Itinerary*, reign of Elizabeth, he says: "At Venice each person was served (besides his knife and spoon) with a fork to hold the meat while he cuts it, for there they deem it ill manners that one should touch it with his hand." Thomas Coryate describes, with much solemnity, the manner of using forks in Italy, and adds, "I myself have thought it good to imitate the Italian fashion since I came home to England," A.D. 1608.

Königsberg, the capital of east Prussia, in lat. 54° 42' 11" N., long. 20° 29' 15" E. Population, in 1846, 75,234. Königsberg is situated on the Pregel, which flows in the Frische Haif, or Fresh Bay, a large

lake having from 10 to 14 feet water. The bar at the mouth of the Pregel has only from 10 to 11 feet water, so that vessels of more than that draught of water require to be lightered to come up to Königsberg. Pillau, in lat. 54° 33' 39" N., long. 19° 52' 30" E. on the north side of the entrance from the Baltic to the Frische Haff, is properly the port of the town. Within these few years, a light-house has been erected on a rising ground, a little to the south of Pillau, the lantern of which is elevated 95 feet above the level of the sea. The light is fixed and brilliant. The entrance to the harbor is marked by buoys; those on the larboard side being surmounted by small flags. A Gothic building, 120 feet above the level of the sea, has been erected to serve for a land-mark; at a distance it looks like a three-masted ship under sail. There is usually from 15 to 16 feet water between the buoys on entering the harbor; but particular winds occasion material differences in this respect. Being situated on a navigable river of considerable importance, Königsberg has a large command of internal navigation, and is the principal emporium of a large extent of country. Wheat, rye, and other species of grain are the chief articles of export. The wheat is somewhat similar to that of Dantzic, but of inferior quality, being larger in the berry, and thicker skinned. The rye is of good quality, but barley, with few exceptions, is thin and light. A few remarkable large and fine peas are exported; but the bulk are of small size, and inferior. Oats are common feed, with a slight admixture of tares, but as these last answer in some degree the purpose of beans, the value of the oats is rather enhanced than otherwise by the circumstance. More tares are shipped here than from any other port in the Baltic. The price of all sorts of grain is usually lower at Königsberg than at the neighboring Prussian ports. Linseed and rapeseed, hemp, flax, linens, oil-cake, oil, bristles, refined sugar, etc., are largely exported.

Money, Weights, and Measures, same as at Dantzic; see DANTZIC.

Kurachee, or Karachee, the principal sea-port town of Scinde, on an inlet of the Indian Ocean, 18 miles from the west branch of the Indus. Lat. 24° 47' 3" N., long. 66° 56' 2" E. It stands on a low, sandy shore, and a few years ago consisted, with its extensive suburbs, mostly of straggling huts; but the latest accounts state that it has been almost rebuilt, and greatly improved since it has become a British possession. Its trade and consequence are rapidly augmenting. The harbor is the only port along this coast for vessels drawing more than 10 feet water, and is sheltered by Cape Munorah, four miles south-west.

L.

Laboring of a ship, implies pitching or rolling heavily in a turbulent sea, an effect by which the masts and hull are greatly endangered; because by the rolling motion the masts strain upon their shrouds with an effort which increases as the sine of their obliquity; and the continual agitation of the vessel often loosens her joints and makes her extremely leaky.

Labrador, a large peninsula of North America, nearly of a triangular shape, extending from N. lat. 50° to 63° , and from W. long. 56° to 79° . It is bounded on the south by Canada and the Gulf of St. Lawrence, east by the Atlantic Ocean, north by Hudson's Straits, and west by Hudson's Bay. Labrador is thus detached from the arctic lands, but is nevertheless a country as frozen, desolate, and barren, as those on the west of Hudson's Bay. The coast along that spacious inland sea is called East Main, and the climate there is peculiarly rigorous. The whole surface of Labrador, indeed, is as sterile and naked as any part of the globe. The prevailing features are rocks, swamps, and water; and vegetation appears as the last effort of expiring nature. Small, scraggy poplars, stunted firs, creeping birch, and dwarf willows, thinly scattered in the southern parts, constitute the whole of the trees. Herbs and grass are also in sheltered places to be met with, but in the most northerly parts only varieties of moss and lichens are to be found. The whole of the interior, from the aspect of what has been explored, and from the reports of the Esquimaux and other Indians, seems to be broken up with rivers, lakes, and rocks. The prevailing rock continuous to the sea-shore of Labrador, is gneiss. On this, at L'Anse à Loup, the most fertile part of the country, a bed of old red sand-stone, about 200 feet thick, is superimposed, and extends about half a mile inland. Here, also, as on other parts of the coast, the appearances of the cliffs and of the land near them, and the rolled masses inland, which have evidently been exposed to the action of the sea, seem to prove that the latter has considerably receded.

On the coast of Labrador the winter is extremely severe, the thermometer often falling 80 degrees below the freezing point; and although the houses of the Moravian missionaries are heated by large cast-iron stoves, the windows and walls are all the winter covered with ice, and the bed-clothes freeze to the walls. Rum is frozen in the air as rapidly as water, and rectified spirits soon become thick like oil. From December to June, the sea is completely frozen over, and so intense is the cold during the winter months, that traveling is sometimes attended with the most painful consequences. The summer months, again, are extremely hot along the coast, the thermometer rising to 86 degrees of Fahrenheit, when swarms of mosquitoes infest the air.

The climate is not insalubrious; and, notwithstanding all its disadvantages, Labrador is of considerable importance to Great Britain. No country is better provided with large, convenient, and safe harbors, or supplied with better water; and vast multitudes of all those kinds of fish common to the arctic seas abound on the coast. Herrings are very fine and plentiful in August, but there is no weather to cure any kind of fish after the 10th of September. The rivers are frequented by salmon and sea trout; and pike, barbel, eels, river trout, and the like, are likewise found in them. On the numerous islands which are scattered along the east coast, multitudes of eider-ducks and other water-fowl breed. Those of large size have deer, foxes, and hares upon them. On the continent the wild animals are principally bears, wolves, foxes,

and otters; beavers and deer are not numerous, but their furs are remarkably close and beautiful. The birds of the country are the white-tailed eagle, falcons, hawks, and owls of various kinds; raven, white grouse, ptarmigan, spruce-game, whistling-curlew, gray plover, various kinds of sand-pipers and other waders; geese, ducks of various sorts, shags, gulls, divers, and some few species of small birds. During the short summer insects are very numerous, especially in swampy places. In winter they exist in a state of torpidity, from which they are aroused by the solar heat or artificial warmth. The phenomenon of the aurora borealis is uncommonly brilliant in this region, and exercises a very marked influence over the compass.

No accurate account of the trade of Labrador can be obtained, as there are no custom-houses or public officers in the country; but the following estimate is probably as close an approximation as can be made to the annual value of the exports:

In Newfoundland vessels	£240,000
" Nova Scotia	96,000
" American	96,000
" Canadian	29,000
" Vessels owned or chartered by English or Jersey houses.....	96,000
Total.....	£557,000

Some, however, estimate the total exports at £800,000.—E. B.

The exports of Labrador are cod, herring, pickled salmon, fresh salmon (preserved in tin cases), seal-skins, cod and seal oil, furs, and feathers.

Fisheries of Labrador.—As late as 1761, it is not probable that fishermen of any flag had visited the waters of Labrador. The English whale and sea fisheries were the first, and employed upward of 100 vessels, at times, prior to the year 1775. The earliest adventures were near 1763; as at that time the Labrador country was politically separated from Canada, and annexed to the government of Newfoundland by royal proclamation, to the end that the "open and free fishery of our subjects may be extended." The pursuit of the cod and salmon followed. Meantime the Moravians, whose principal settlement is at Nain, who have ever led a quiet and simple life, and who now annually ship furs, oils, and other productions of that region to England, in payment for the manufactured commodities which they require, had founded a colony. The islands are so numerous, and so near each other, as to resemble, and often to be mistaken for, the main land. Back from the coast, the country is still unknown. Labrador still forms a part of the colony of Newfoundland. The natives bear the general name of Esquimaux. The resident inhabitants of European origin are English, Irish, Jerseymen, and Canadians, who are employed either on their own account, or as servants of others, as furriers, seal-catchers, and cod and salmon-fishers.

The Canadian fisheries are small. They send 8 or 10 vessels to the coast, with 80 or 100 men. They fish for cod and salmon. They carry a part of what they catch to Quebec, and send a part to Europe. The colonists of Nova Scotia and New Brunswick adventure at Labrador to a considerable extent; but they do not pursue the business as regularly and with as much system as do those of Newfoundland. Sometimes they send more than 100 vessels in a year; at others the number is much less. They engage principally in the cod-fishery, making a single fare and curing their fish at home. The Labrador fisheries have "increased more than sixfold," says Macgregor, "principally in consequence of our fishermen (the

English) being driven from the grounds now occupied by the French," since the year 1814; and he estimates that about 20,000 British subjects are at present required during the fishing season, in the catching, curing, and transporting the various products of these remote seas.

STATISTICS OF FISHERIES.

Year.	Vessels	Men.	Dry fish produced.		Salmon produced.	Seals caught.	Oils produced.		Value.
			Quintals.	Tierces.			Tuns.	Dollars.	
1829	608	9,110	678,000	1,682
1831	700	11,200	720,000	2,480	16,000	2,200	1,450,000

The fishing establishments of the English and Jersey merchants are extensive and well conducted. They are engaged in the cod and salmon fisheries, and in the taking of seals. In the year 1831, the value of their shipments to Europe was upward of \$200,000. The number of these commercial houses is from 10 to 12, who manage their business at Newfoundland, either by the temporary presence of junior partners or clerks, or by resident agents. The people of Newfoundland, averring that the French and Americans have driven them from their own "bank-fishery," resort to Labrador. They employ 200 or 300 vessels. A part make two voyages in a season. The first fare is commonly cured on the coast; but the second is carried home without drying. Some of the merchants of Newfoundland ship both cod and salmon directly to correspondents in Europe; while others order their captains to return to the island and unlade their fish and oil at their own warehouses.—SABINE'S *American Fisheries*.

Labuan, a small island off the north-west coast of Borneo, a dependency on the British crown, about six miles distant from the nearest point of the mainland, and 80 miles north from the city of Borneo or Bruni, lat. $50^{\circ} 12' N.$, long. $115^{\circ} 19' 36'' E.$ It is from 25 to 30 miles in circumference, flat, and covered with wood. The anchorage on the south side of the island is protected by a greater and three smaller islands; and the town of Victoria has been commenced at the embouchure of a rivulet in a small bay, at the head of the anchorage. Coal of good quality is found on the island, and it is well supplied with fresh water. It was ceded by the Sultan of Borneo to Great Britain in 1844; and Sir James Brooke, who negotiated its cession, was afterward appointed its governor. When it came into possession of the English it was uninhabited; but its situation is such that, provided it be moderately healthy, it can hardly fail to become an important emporium. It lies near the best route for shipping from the Straits of Singapore to China, and, while it is extremely well situated for carrying on trade with the west and north coasts of Borneo and the Philippine Islands, it will serve as a harbor of refuge, and as a convenient station for the steamers and other ships of war required to put down the piracy that has been, to the great injury of commerce, carried to so great extent from the ports and rivers of Borneo, and of some of the adjacent islands. In this respect, its abundant supply of coal will be of the greatest service. In war, the possession of Labuan will give to the English entire command of the Chinese Sea.—BROOKE'S *Journal*.

Borneo, or Bruni, on the adjacent shore of the mainland, and the residence of the Sultan of Borneo proper, has been termed the Venice of the East. It contains from 80,000 to 40,000 inhabitants, mostly Malays, and really seems as if it floated on the waves. It is situated on an estuary, and though built with little regard to regularity, it is intersected crosswise by two main streets, which divide it into four portions, one only of which stands on dry land. The houses in the other three parts are of wood, built on piles, which support them above the water, with streets, if so they may be called, to admit the passage of canoes. The steamer

which conveyed Sir James Brooke to Borneo, when Labuan was ceded, anchored in the main street, in the centre of the town! "The greatest novelty at Bruni," says Mr. Marryat, from whom we have borrowed these details, "is the floating bazaar. There are no shops in the city, and the market is held every day in canoes. These come in at sunrise every morning from every part of the river, laden with fresh fruit, tobacco, pepper, and every other article which is produced in the vicinity; a few European productions, such as handkerchiefs, check-cotton prints, etc., also make their appearance. Congregated in the main street, the canoes are tacked together, forming lanes, through which the purchasers, in their own canoes, paddle, selecting and bargaining for goods with as much convenience as if the whole were transacted on *terra firma*. Iron is here so valuable that it is used as money. 100 flat pieces, an inch square, are valued at a dollar; and among the lower classes these iron pieces form the sole coin. They are unstamped, so that any person appears to be at liberty to cut his own iron into money; but whether such is really the case, I can not vouch."—MARRYAT'S *Borneo*.

But though deficient in iron, the gold mines of Borneo are said to be of the richest description. Sir Stamford Raffles estimated that in his time about 32,000 Chinese laborers were employed in these mines on the west coast of Borneo; and it is not easy to say how productive they might become were the miners in a condition to prosecute their undertakings in safety, and to bring the resources of science and of capital to their aid. Antimony is also found in abundance in Borneo, especially in the district of Sarawak, of which Sir James Brooke is rajah; and the diamonds of Borneo rival those of India and Brazil. But independently of its coal, and of its precious and other metals, its vegetable products might alone furnish the materials of an extensive commerce. The sago-palm grows in great perfection in many parts of the island, and sago is largely exported in a rough state to Singapore. The areca nut, rattan, gutta-percha, gum-benjamin, camphor, birds' nests, etc., are also considerable articles of export; and sugar, pepper, and all the products of tropical regions, might, with a little care, be raised to any extent in most parts of this vast island. The numbers and ferocity of the savages by whom it is occupied present, indeed, formidable obstacles to its improvement. But civilization is beginning to make its way among them; and, though probably slow, its progress can not well be arrested.

Lac or Gum Lac (Ger. *Lack*, *Gummilack*; Fr. *Lacque*, *Gomme lacque*; It. *Lacca*, *Gommilacca*; Sp. *Goma laca*; Rus. *Laka*, *Gummilak*; Arab. *Laak*; Hind. *Lak'h*; Sans. *Lākshā*), a substance which has been improperly called a gum, produced in Bengal, Assam, Pegu, Siam, etc., on the leaves and branches of certain trees, by an insect (*Chermes lacca*). The trees selected by the insect on which to deposit its eggs are known by the names of the bihar-tree (*Croton lacciferum* Lin.), the pepel (*Butea frondosa*), bott and coosim-trees, etc. After being deposited, the egg is covered by the insect with a quantity of this peculiar substance, or lac, evidently intended to serve, in the economy of nature, as a nidus and protection to the ovum and insect in its first stage, and as food for the maggot in its more advanced stage. It is formed into cells, finished with as much art as a honeycomb, but differently arranged. Lac yields a fine red dye, which, though not so bright as the true Mexican cochineal, is said to be more permanent; and the resinous part is extensively used in the manufacture of sealing-wax and hats, and as a varnish. Lac, when in its natural state, incrusting leaves and twigs, is called *stick lac*. It is collected twice a year; and the only trouble in procuring it is in breaking down the leaves and branches, and carrying them to market. When the twigs and sticks are large, or only partially cov-

ered, the lac is frequently separated from them, as it always ought to be when shipped for market, to lessen the expense of freight. The best stick lac is of a deep red color. When held against the light it should look bright, and when broken should appear in diamond-like points. If it be not gathered till the insects have left their cells, it becomes pale, and pierced at the top; and it is of little use as a dye, though probably better for a varnish.

Lac dye, lac lake, or cake lac, consists of the coloring matter extracted from the stick lac. Various processes have been adopted for this purpose. It is formed into small square cakes or pieces, like those of indigo. It should, when broken, look dark-colored, shining, smooth, and compact; when scraped or powdered, it should be of a bright red color, approaching to that of carmine. That which is sandy, light-colored, and spongy, and which, when scraped, is of a dull brick-dust color, should be rejected. Notwithstanding the continued fall in the price of cochineal, the use of lac dye has been extending. The annual consumption in 1858 was estimated at about 1,200,000 lbs., having more than quintupled since 1818. The finest qualities of lac dye are seldom met with for sale in Calcutta, being generally manufactured under contract for the European market. When stick lac has been separated from the twigs to which it naturally adheres, and coarsely pounded, the native silk and cotton dyers extract the color as far as it conveniently can be done by water. The yellowish, hard, resinous powder which remains, having somewhat of the appearance of mustard-seed, is called *seed lac*. When liquefied by fire, it is formed into cakes, and denominated *lump lac*. The natives use the latter in making bangles, or ornaments in the form of rings, for the arms of the lower class of females; the best *shellac* being used in manufacturing these ornaments for the superior class.

Shellac is produced from seed lac, by putting the latter into bags of cotton cloth, and holding it over a charcoal fire, when the lac melts, and being strained through the bag, the resinous part, which is the most liquefiable, is obtained in a considerable degree of purity; it is formed into thin sheets or plates. Thin, transparent, or amber-colored shellac is best. Avoid that which is thick, dark, and speckled. It should always, when broken, be amber-colored on the edge. That which has a dark-brown fracture, however thin, should be rejected. When laid on a hot iron, shellac, if pure, will instantly catch fire, and burn with a strong but not disagreeable smell. It used to be principally employed in this country in the manufacture of sealing-wax and as a varnish, but it is now very extensively used in the manufacture of hats. In Bengal lac is chiefly produced in the forests of Sylhet and Burdwan. The finest dye is said to be obtained from the stick lac of Siam and Pegu; but the shellac or resinous part obtained from the latter is inferior to that produced from Sylhet stick lac. It may be obtained in almost any quantity.—BANCROFT on *Permanent Colors*; AINSLIE'S *Mat. Med.*; MILBURN'S *Orient. Com.*

Lac of Rupees, is 100,000 rupees, which, supposing them standard or siccas, at 2s. 6d. each, amounts to £12,500 sterling.

Laccadives, an archipelago of low islands lying off the western coast of India, between 8° and 13° N. lat. There are 19 considerable ones; but as most of them are surrounded with reefs and steep rocks, with a great depth of water close to them, the approach to them is very dangerous. Between these islands there are many channels, through which ships from India, bound to Persia or Arabia, frequently sail. The safest of these is called Mamale, or the Nine-degree Channel, which runs between the islands of Seuhilipar and Kulpenny. The largest of these islands is about 7 miles in length and 2½ in breadth. Most of them are inhabited by a race of Mohammedans called

Moplays. They do not yield grain, but produce an infinite quantity of cocoa-nuts, from the husks of which they form the *coir* cables, which are more elastic and durable than hemp, as the sea-water, instead of rotting, preserves them. These islands are well supplied with fish, and carry on a trade with the small shells called *couries*, which pass as coin all over India and most of Africa. Most of these islands are under the uncontrolled management of the beebees of Cannanore, subject to the payment of an annual tribute to the British government. A proposal has been made to the beebee to transfer them to the British, in consideration of a pecuniary equivalent. They were discovered by Vasco de Gama in 1499, but have since been little frequented by Europeans.

Lace (*Du. Kanten*; *Fr. Dentelle*; *Ger. Spitzen*; *It. Merletti, Pizzi*; *Rus. Krushewo*; *Sp. Encajes*), a plain or ornamented net-work, tastefully composed of many fine threads of gold, silver, silk, flax, or cotton, interwoven, from *Lacinia* (Lat.), the guard hem or fringe of a garment. This delicate fabric appears to have claims to high antiquity, but its origin is involved in considerable obscurity. That it was worn by Grecian females is certain, and the derivation of the word *lace* affords presumptive evidence that it was also in use among the Romans. In Venice, and the neighboring States of Italy, it was very early worn; and Mary of Medicis is supposed to have been the first who introduced its use into France; but as early as 1483 it was included in a list of articles prohibited from importation into England. Hence it had been made in this country prior to the period above mentioned; and this prohibition, like many other subsequent acts, was for the protection and encouragement of home manufactures. But *pins*, which are indispensable in the process of fine lace-making, were unknown till long afterward; so that it is probable the fabric made was neither very fine in texture nor produced to any great extent. It is uncertain by whom the manufacture of lace was originally introduced into this country. About the middle of the 17th century the lace trade was flourishing in Buckinghamshire; and so greatly had it advanced in England, that, by a royal ordinance in France, passed in 1660, a mark was established upon the thread lace imported from this country and from Flanders, and upon point lace from Genoa, Venice, and other countries.

Pillow, or Thread Lace, is made by placing a perforated pattern on a hard stuffed pillow, and the thread required is wound upon bobbins with a groove in the upper part for retaining the thread; while, to form the meshes, pins are stuck in the cushions, and threads woven or twisted round them, the pattern showing the points of insertion for the pins, and also the direction for the gimp, which is interwoven with the fine threads of the fabric to form the pattern. At the commencement of the work the bobbins are arranged on one side of the cushion, and are brought to the front side, two pairs at a time, and twisted together. The woman holds one pair of bobbins in each hand, and twists them three times over each other to form the sides of the mesh, the adjacent bobbins of each pair are next interchanged, so as to cross these threads over one another to form the bottom of the next. Supposing the four bobbins to be marked 1, 2, 3, 4,—No. 1 is twisted round 2, and No. 3 round 4; these, in order to cross 2 and 3, are interchanged, so that 1 and 3 and 2 and 4 come together, and at the next twist these pairs of threads will be combined. As the meshes or half-meshes are formed, they are secured by pins. These four bobbins are now put on one side of the cushion; two more pairs are brought forward, twisted and crossed as before, and these operations are repeated until a row of meshes is formed of the required breadth, when the bobbins are worked over again to form another row. From 48 to 60 bobbins are required for every inch of breadth. Pillow or thread

lace, formerly employed a large number of women and children in the counties of Bedford, Buckingham, Northampton, and Oxford, but the demand for this kind of white thread lace failed, and black lace took its place. *Honiton lace* differs from pillow lace in having the pattern made separately. The ornaments were formerly confined to simple sprigs and borders; but the fabrics now produced show extreme delicacy of execution, with beauty and taste in design: flouncings, shawls, scarfs, handkerchiefs, berthes, etc., now vary in price from 10 to 200 guineas. The Honiton lace district extends about 30 miles along the coast of Devonshire, and about 12 miles inland. In 1851 from 7000 to 8000 persons were employed in the manufacture.

British point, tambour, and Limerick laces are chiefly imitation, and are produced in shawls, scarfs, dresses, court trains, flouncings, lappets, etc. *British point* is made chiefly in the neighborhood of London, *tambour* chiefly at Islington, Coggleshall, and Nottingham, while *Limerick lace* is peculiar to Ireland. Black laces now occupy a considerable portion of the attention of the trade. The most celebrated laces have been classed as—1. *Brussels*, the most valuable. There are two kinds: *Brussels ground*, having a hexagon mesh, formed by plating and twisting four threads of flax to a perpendicular line of mesh; *Brussels wire ground*, made of silk; meshes partly straight and partly arched. The pattern is worked separately, and set on by the needle. 2. *Mechlin*: a hexagonal mesh, formed of three flax threads twisted and platted to a perpendicular line or pillar. The pattern is worked in the net. 3. *Valenciennes*: an irregular hexagon, formed of two threads, partly twisted and platted at the top of the mesh. The pattern is worked in the net similar to Mechlin lace. 4. *Lille*: a diamond mesh, formed of two threads platted to a pillar. 5. *Alençon*, called *blond*: hexagon, of two threads, twisted similar to Buckingham lace; considered the most inferior of any made on the cushion. 6. *Alençon point*: formed of two threads to a pillar, with octagonal and square meshes alternately.

In the manufacture of lace, France takes the lead; and it is calculated that the production of lace by hand gives employment in that country to upward of 200,000 females of all ages. It is all made with bobbins upon a small pillow, except at Alençon, where the needle only is employed. The materials used are hand-spun linen thread, cotton, wool, silk, and gold and silver thread. *Point d'Alençon* is the only lace made with pure linen hand-spun thread; this thread is worth from \$500 to \$600 per pound. White lace is now chiefly made with cotton thread, Nos. 120 to 320. The principal seats of the manufacture are—Caen and Bayeux, Chantilly and its neighborhood, Lille, Arras, Mirecourt, Puy, Bailleul, and Alençon. Each of these districts has its own peculiar style; and although the lace may be made in the same way, and with the same material, in all these districts except the last, yet each is easily recognized. Silk blond originated at Caen, and was so called from being made of undyed silk of a nankeen color: the finest white or the finest black silk is now employed. Caen and Bayeux excel all other places in the production of piece goods, and manufacture shawls, robes, mantles, etc., more extensively than any other districts in the world. By means of a stitch called *rucroe*, the women of the department of Calvados join several parts into one piece so cleverly as to defy detection, even with a magnifying glass. Most of the improvements and novelties in lace-making originate at Mirecourt; it produces the same kind of lace as Lille and Arras, viz., clear foundation, *fonds clair*, and also *fonds de champs*, in white thread, also a lace resembling the Honiton called *guipure*.

Flowers are also made, and sewed upon the extremely fine net called *Brussels net*, closely resem-

bling the Belgian fabric. The whitest and cheapest French lace is produced at Bayeux.

Belgium is the great rival of France in the manufacture of laces, the chief varieties of which are known as *Brussels*, *Mechlin*, *Valenciennes*, and *Grammont*. Brussels produces two descriptions of lace, known as *point à l'aiguille*, and *Brussels plait*, the one made entirely with the needle, and the other on the pillow. The finest kind is made of very fine flax thread, and some of cotton. It is remarkably soft and clear, but very costly. Mechlin laces are made at Malines, Antwerp, etc. They are made in one piece on the pillow, and the flowers are surrounded by a plait thread, which designs the outline, and has the effect of embroidery. Valenciennes laces are made chiefly at Ypres, Menin, Courtrai, Bruges, Ghent, Alost, and their respective neighborhoods, each town having its characteristic peculiarities by which its productions are identified. Ypres produces laces of the finest square grounds, varying in price from 12 cents to \$250 the English yard.

It is natural to suppose that attempts would be made to lessen the cost of production of so beautiful and costly an article as lace. It was not, however, until machinery had been largely introduced for the purpose of manufacturing textile fabrics that lace machinery can be said to have been successfully employed. About the year 1768 a frame-work knitter of Nottingham employed the common stocking-frame in the manufacture of lace, and about the same time another person of the same place introduced a pin machine for making single-press point-net in imitation of the Brussels ground. Various machines were from time to time introduced, all of which, except the *warp machine*, have been superseded by the *bobbin-net machine*, so called from the circumstance that the thread that makes the lace is partly supplied from bobbins and partly from a warp. The first successful machine of this kind was made and patented by John Heathcote in 1809, the principle of which was to pass the bobbins from front to back, and from back to front, while a lateral motion was imparted to the warp-threads, thus causing one series of threads to wrap round the other. The first machine was so complicated, that 60 motions were required to complete one hole—an effect that can now be produced with six. The cost of production has also more than proportionally decreased; for in 1815 one square yard of the produce was worth \$7, and can now be purchased for eight to ten cents. Up to the year 1831 plain net and quillings were the chief produce of the bobbin-net machine; but about this time methods were introduced to *purl* and *bullet-hole* the edges of narrow laces, finishing them afterward, with a gimp thread, with the needle. The machines used were known as the *Leavers*, named after the original constructor; the *pusher machine*, so called from having independent pushers to propel the bobbins and carriages from front to back, instead of pulling or hooking them; the *circular machine*, so called from the bolts or combs on which the carriages pass being made circular instead of straight; the *traverse-warp machine*, so called from the warp traversing, instead of the carriages. About the year 1839 the *Jacquard* apparatus was successfully applied to a pusher machine; and since 1841, when a plan was discovered for applying the Jacquard to the guide-bars, scarcely a machine has been worked without the ornaments being applied by means of cards. New sources of manufacture soon developed themselves, such as flouncings, scarfs, shawls, window-curtains, etc.

Bobbin-net lace owes much of its beauty to the quality of the threads, and the correct shape of the meshes. By increasing the number of warp-threads within a given space the meshes are reduced in size, and finer lace is formed. There may be from 700 to 1200 and upward of warp-threads in a piece one yard wide. The fineness, or *gauche* or *points*, as it is called, depends

on the number of slits in the combs, and hence on the number of bobbins in an inch; thus *guage nine points* indicates nine openings in one inch of the comb. The length of work counted vertically, and containing 240 holes or meshes, is called a *rack*. A circular-bolt machine may produce about 360 racks per week. Bobbin-net is made up in pieces of from 20 to 30, or more yards in length, and of variable breadth. Narrow quillings are worked together in a number of breadths, united by threads, which are afterward drawn out. In well-made lace the meshes are slightly elongated in the direction of the selvage. Ornaments, consisting of separate flowers, sprigs, etc., are worked in by a Jacquard apparatus attached to the frame; but as the ornaments are all necessarily connected by the thread of gimp which forms them, the connected thread is afterward cut out with scissors, by children employed for the purpose. Where the machine produces only one plain net, the pattern is worked in by hand, the lace-runner being guided by a lithographic pattern placed under the net. When the embroidery is complete, it is examined, defective parts are marked by tying the lace in a knot, and these are restored by a distinct set of women called *lace-menders*.

In addition to the bobbin-net machine for making lace, there is also the *warp machine*, invented about the year 1775. It was suggested by the stocking-frame, in which only one thread is required, while in the warp-frame there is a thread to each needle. The first articles made by it were silk stockings, with blue and white zig-zag stripes, or *vandykes*, as they were called, from the name of one of the four claimants to the invention of the warp-frame, the other three being Englishmen. About 1784 a Nottingham mechanic greatly improved the warp-frame by the application of the rotatory motion, and the cam-wheels to move the guide-bars, still known as *Dawson's wheels*. The improved frames produced officers' sashes, purses, braces, and other elastic textile fabrics, the manufacture of some of which still continues. In 1796 a new fabric was produced from the warp, and employed for sailors' jackets, pantaloons, and the article known as Berlin, so much used for making gloves. Warp machines were the first to produce ornamental patterns on lace, such as spots, bullet-holes, etc., which had been previously embroidered or tamboured by hand. The bobbin-net machine, invented in 1809, soon became a formidable rival of the warp, and influenced its fortunes in various ways, until 1839, when the Jacquard apparatus was applied to it, and so much increased its capabilities as to introduce into the warp-lace trade of Nottingham a new class of products of elaborate design, such as shawls, scarfs, mits, falls, laces, etc. Of late years the *twist machine* has been employed on similar goods, and has to a great extent superseded the warp. Great improvements have also been introduced in the English methods of *dressing* lace, especially in silk goods. Many new kinds of elastic fabrics, in gloves, in silk, and other materials, have been introduced. Velvet, and velvet in combination with lace, have also been produced at the warp-frame. At the time of the Great Exhibition there were about 1400 warp-frames in operation, namely about 600 in Leicestershire, about 400 in Derbyshire, and about the same number in Nottinghamshire. The employment in the various branches was estimated as follows: 150 machines engaged in the production of blond, and other silk laces; 150 in cotton tatting, 550 in Leicester hosiery, etc.; 100 in lace gloves and mits, 150 in woollen cloth, hosiery, purses, and various fabrics for gloves, etc. The first machines were about 16 inches in width; they are now, in the Nottingham trade, from 90 to 150 inches in width, and in the Leicester hosiery trade, from 44 to 72 inches. The number of persons employed in the warp trade in Great Britain, in 1851, was estimated at 10,000, and the capital invested at \$1,800,000, making a return per annum of

\$3,500,000. In the Great Exhibition was exhibited a power machine, capable of producing (working 12 hours per day) 800 racks per week, which, when dressed, would be equal to about 1200 square yards. A yard of 4-quarter white silk blond, which in 1830 cost 50 cents, can now be had for 12 cents.

Gold and Silver Lace.—The textile fabric known as gold or silver lace consists of warp threads of silk, or of a mixture of silk and cotton, while the weft or shoot is a silk thread covered with silver, or with silver gilt, as the case may be. The production of this thread is a remarkable illustration of the extensibility of gold, and of the ductility of silver. The silver preferred by the wire-drawers is that which has been separated from argentiferous galena, this being less brittle than the silver obtained from purer sources. From 400 to 500 ounces are cast into an ingot about 2 inches in diameter, and from 20 to 24 inches in length. This is made red-hot in a charcoal fire, and hammered until sufficiently reduced to pass through the first hole of the draw-plate, the hammering increasing the tenacity and elasticity of the metal. After the bar has been reduced by passing through 10 or 12 holes, it is planed, in order to remove any imperfections from the surface which would interfere with the perfect gilding; the blemishes are readily detected by the reflection of a sheet of foolscap paper slightly arched, and placed over the bar. The bar is now gilt, by placing on it a number of gold leaves, varying from 10 to 30, according to the richness of the wire required, the higher qualities being used for military purposes, and pearls and bullions for embroidering, while the lower qualities are used for liveries, the ends of muslins, and for skein threads exported to India and China. The gold leaves are placed in a row, side by side, nearly the length of the bar, on a piece of cartridge paper: the bar is then gently placed on the leaves, pressed close, and the edges of the leaves raised up until the silver is entirely covered. The bar is next enveloped in paper tied tightly round with cord, and placed in a charcoal fire, where it is left until it becomes of a bright red heat, the paper not burning, but becoming red with the metal, when it slowly consumes, after which the bar is withdrawn. While still red-hot it is burnished with a blood-stone or with South Sea ax-stone, for the purpose of uniting the gold and the silver perfectly. When cold the surface is covered with wax, and the bar is drawn into wire through graduated steel dies, and, after one or two annealings, finished by drawing through perforated rubies, so fine that from an ounce of metal a wire a mile and a quarter in length is produced. At this point the wire has not so rich and deep a shade of yellow as is required, but this is given by winding the wire round a copper cylinder, with the addition of a small portion of wax, and filling the cavity of the cylinder with red-hot charcoal made from birch-wood, the effect of which is to deepen the color, and render it permanent. The next process is to flatten the wire by passing it between a couple of steel rollers, one of ten, and the other of four inches in diameter, made of the finest steel, and of exquisite polish. They are manufactured in Rhenish Prussia, at a cost of \$600 for a single pair of rollers. The flattened wire is wound on small bobbins, which are placed in the centre of circular rings, attached to a bar over a spinning frame. On the front of the frame are bobbins of silk, the threads of which pass through the centre of the ring to which the reel of wire is fixed. The whole is set in motion, and while the thread is being twisted, the ring with the wire revolves round the thread in the opposite direction. In this way from 30 to 40 threads are covered at once, the result being a resplendent flexible gold thread, adapted to the purposes of lace-making, embroidery, etc. Of this thread, although gold only appears, probably 9-10ths of its bulk is silk, while of the remaining 1-10th only 1-50th part is gold. See details on this subject in the *Journal*

of the Society of Arts, No. 178, in the Report of Mr. F. Bannoeh's paper on "Thread or Fibre Gilding."—E. B.

The exports of laces from the United States for the year 1856, were as follows:

Countries.	Thread and Insertings.	Value.
Canada.....	\$15,730	\$25,378
British possessions.....	1,440
Mexico.....	249	1,472
Total.....	\$17,458	\$26,845

STATEMENT SHOWING THE IMPORTS OF LACES AND EMBROIDERIES INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30TH, 1856.

Whence imported.	Laces.		Embroideries of wool, cotton, silk, and linen.
	Thread and Insertings.	Cotton Insertings, trimmings, laces, braids, &c.	
Sweden and Norway.....	\$12
Hamburg.....	\$29	11,542
Bremen.....	82,704	\$13,655	186,754
Holland.....	746
Belgium.....	111	35	2,254
England.....	275,546	1,151,222	3,294,092
Scotland.....	279	3,940	198,194
Malta.....	27	28
Canada.....	15

British pos. in Africa.....	40
British East Indies.....	252
France on the Atlantic.....	100,252	19,743	953,483
France on the Mediter.....	112	1,725
Canary Islands.....	258
New Granada.....	1,502	2,023	7,210
China and other places.....	29	2,724
Total.....	\$410,591	\$1,191,019	\$4,664,353

Lacquer, or **Lacker**, a yellow varnish, consisting of a solution of shellac in alcohol, colored by gamboge, saffron, annatto, or other yellow, orange, or red coloring matters. Lacquers are chiefly used for varnishing brass and some other metals, in order to give them a golden color and preserve their lustre.

Lacquer Ware, is derived from the Hindoo name *lac*, which is the resin secreted together with lac-dye by the lac insect. The lacquer ware has a covering or coating of lac; but two different processes are often confounded in India under this name—the one prevailing in the southern parts of India and in Burmah; the other in Cashmere and Lahore. The former of these wares, comprising lacquered cabinets, boxes, &c., was much appreciated in the last century; part being brought from Burmah and India, and part from China; but the lacquered or japanned work of Japan, seems to have been superior to either; many fine specimens of it may still be seen in the forms of large folding screens, &c. The chief expense of the manufacture arises from the care with which successive layers of varnish must be laid on. Boxes have been sent to this country in various stages of progress, which show the gradual production of the desired effect. The other kind of lacquered ware partakes somewhat of the nature of papier-maché, covered with one or more layers of lac varnish. Many of the lacquered boxes belonging to this class, from Cashmere and Lahore, are remarkable for the elegance of their patterns.

Lading, bill of. See **BILL OF LADING**.

Laden, in nautical language, the state of a ship when she is charged with a weight or quantity of any sort of merchandise or other materials equal to her tonnage or burden. If the cargo with which she is laden be extremely heavy, her burden is determined by the weight of the goods; if it be light she carries as much as she can stow, that she may be fit for the purposes of navigation. As a ton in measure is generally estimated at 2000 pounds in weight, a vessel of 200 tons ought, accordingly, to carry a weight equal to 400,000 pounds, when the matter of which the cargo is composed is specifically heavier than the water in which she floats; or, in other words, when the cargo is so heavy that she can not float high enough with so great a quantity of it as her hold will contain.

Laden in bulk, the state of being freighted with a cargo which is neither in casks, boxes, bales, nor cases, but lies loose in the hold, being defended from the moisture or wet of the hold by a number of mats, and a quantity of dunnage. Such are usually the cargoes of grain, salt, or such materials.

Ladoga, a lake in Russia, the largest in Europe, lies between the governments of Viborg on the north and west, Petersburg on the south, and Olonetz on the east. Its greatest length is about 130 miles, breadth above 70. The coast is generally low, much indented, and abounding in dangerous reefs. The depth in some places reaches about 150 fathoms, in others it is insufficient for safe navigation. Storms are frequent, and the influx of many considerable streams produces strong currents. The chief rivers entering the lake are the Swir (or Sver) from the east, bearing the waters of Lake Onega; the Volkhoff on the south; those of Lake Ilmen and the Saima on the north, draining the reticulation of waters of that name. It empties itself on the south-west by the Neva, into the Gulf of Finland. There are numerous islands scattered along the north-western shore, several of them inhabited. The principal towns on the coast are Kexholm, Schlusselburg, and Novaya Ladoga. A canal executed in the reign of Peter the Great connects the two latter, forming a direct communication between the Neva and Volkhoff.

Ladrone, or Marianne Islands (so called respectively from the thievish habits of the natives, and in honor of Queen Mary Anne of Spain), a group in the North Pacific Ocean, between lat. 13° and 21°, long. 144° and 146°. They are about 20 in number, of volcanic origin, irregular and picturesque in outline, and clothed with luxuriant vegetation. The intervening straits abound in shoals and currents, and there are few good harbors. The heat of the climate is somewhat tempered by the trade-winds. Among the vegetable products are sugar, rice, Indian corn, tobacco, cotton, indigo, &c. Of wild animals, the most numerous are swine, sometimes of large size; cattle, horses, asses, mules, and llamas, have been introduced by the Spaniards. The principal island is Guaitan, or St. John, the most southerly of the group. It is about 80 miles in circumference, and has a good fortified harbor, some miles to the south of St. Ygnacio de Agaia, the seat of government. The aboriginal inhabitants, an active and athletic race, have gradually given place to a mixed population, descended of colonists from Mexico and the Philippine Isles. This group was discovered in 1521 by Magellan; but no settlement was made in them for about 150 years, when the widow of Philip IV. sent out a body of missionaries to convert the natives. They were visited in 1742 by Anson, who spent some time on the island of Tinian, where he discovered architectural remains, indicating a considerable progress in the arts of civilization. There are two other small island groups of this name, the one on the coast of China, at the mouth of the bay of Canton, a great stronghold of pirates, the other off the coast of Guatemala.

Lager-Bier was introduced into this country, generally, about nine years ago. The process of manufacturing the peculiar and popular beer under consideration, differs very much from that in making common beer, or ale. The only materials used are malt, hops, and water, and an inspection of the breweries is convincing that much care and cleanliness are exercised in all the operations. Lager-bier ferments downward. Common beer can be made fit to drink in four or five days, according to the heat of the weather; but it requires as many weeks before lager-bier can be drank, and it is thought to improve constantly if it be given years of probation.

Breweries, &c.—The art of fermenting grain was early known to the ancients, who employed it advantageously in fattening animals. Urquhart has noticed

that Penelope steeped the grain with which she fed her geese. The earliest mention of beer is found in the history of the Egyptians, who are said to have invented it more than 12 centuries before the Christian advent. They called it, however, not *beer*, but *Pelusian liquid*, from Pelusium, a city near the mouth of the Nile, where it was first made. Hops were first used in England, A. D. 1524, where, it appears, they were for a time prohibited as a "poisonous drug." The famous *white beer* was made from wheat, at Nuremberg, in Germany, about A. D. 1541. *Ale* was brewed by the English Saxons as early as A. D. 728, and their "barley-wine" was celebrated for its exhilarating qualities. *Porter* was originally a mixture of different draught beers, first compounded in 1730 for the laboring classes in London, who required a beverage of more nutritive qualities than had been produced by the mixture of ales of two, three or four "threads" or draughts. The celebrated German *mumm* was first brewed at Brunswick, A. D. 1492, by Charles Mumm, who gave his name to his invention. England has, however, till recently, been the great "beer country." Official returns show that in 1850 the licensed brewers in the United Kingdom were:

In England, 5631; malt consumed, 24,955,202 bush.; Scotland, 1510; 950,105; Ireland, 951; 164,702.

Of this last quantity, the greater portion was doubtless used in distillation! The licensed tavern-keepers in Scotland are shown by these returns to have numbered 14,971, and the number in Ireland to have been 13,793, many of whom were also licensed to brew or distill.

The quantity of ale and beer brewed in the United States, in 1850, was 1,177,924 barrels; of whisky and high wines, 42,133,955 gallons; of rum, 6,500,500.

The amount of capital invested in the United States' breweries averaged \$8,384,254; and the number of persons employed in this branch of commerce, 5487. The breweries in our American States have been greatly increased of late years by the addition of German capital, amounting nearly to \$7,500,000, distributed among upward of 500 establishments. In 1847, the German breweries first introduced into this country the beverage known as *lager-bier*; perhaps the drink more extensively used than any other beer compound in the present day. The process of brewing this peculiar and popular *bier* differs, we are told, very much from that employed in making common ale or beer. The only materials, we learn, are malt, hops, and water, but the quantities employed, and the mean temperature observed, are a secret to all but the initiated. An inspection of the different breweries, will show that a studied care and cleanliness are exercised in all the operations. Fermentation, which in common beer is upward, we are told, in the instance of *lager-bier*, is the reverse, or downward; but as it is the nature of all fermentation processes for the "workings," as they are termed, to *ascend* for a certain period before they finally settle, we are inclined to believe this "downward fermentation" an ingenious joke, in order to stifle further inquiry. The word *lager*, in German language, means "*rest, repose*," an attention this peculiar drink requires in order to secure a ripening or maturity of perfectness; and from this word the *bier* derives its prefix, *lager*.

The *lager-bier* annually made in New York city and suburbs is estimated at 85,000 barrels, a number we are inclined to believe beneath the actual average. The entire city consumption, however, of this *bier* from all parts, is computed to be not less than 3,075,000 barrels! The city retailers number about 2000, exclusive of the large hotels and restaurants, which alone consume from \$5000 to \$6000 worth annually. In the city of St. Louis, Missouri, there were drank, from 1st March to September 17, 1854, more than 17,500,000 glasses of lager and common beer, and the entire stock of 24 breweries of that district was com-

pletely exhausted. Philadelphia has 22 breweries of lager-bier, and the stock accumulated during the fall and winter of 1855, was valued at \$600,000 wholesale! The city of Cincinnati has 7 first-class and 22 second-class breweries; the value of the "plant" (machinery, tubs, etc., etc.) of the former is estimated at \$150,000 each. The first-class breweries average each about 4000 barrels per year. Most of them have large excavated vaults for stocking or lagering this *bier*. M. Von Beck's store-cellar, in the rocks at Rondout, New York, which will contain 30,000 casks, cost \$15,000 for excavations, etc.

The brewing of *lager-bier* usually commences about October, and is then deposited till the succeeding April or May, when it is considered to be in "fine condition." The Cincinnati lager-bier breweries employ about 250 brewers, and as many others as assistants, etc., etc. The salary of a good foreman is \$1000 per annum and house-rent; his assistants receive from \$30 to \$50 per month. They commence operations at four A. M., and get through in from 9 to 10 hours. These men are remarkable for good health. Some of these establishments make 9 brewings a week. The fall stock of Milwaukee lager-bier, in 1856, was fully 60,000 barrels. The western lager requires to be of a stronger quality than that made in the northern breweries. Of the beneficial qualities of this *bier*, opinions are far from unanimous; the partisans in favor of the beverage profess that from 10 to 60 glasses per day may be drank with impunity! While the editor of the *New York Scalpel*, in his issue for October, 1856, asserts that its continued use produces the most injurious effects on the human constitution, and which, if persisted in, induces disease and gradual decay, mentally and physically.

Lagoon, from the Latin *lacuna*, a ditch, means a morass. The name is given particularly to those creeks which extend along the coast of the Adriatic, in the present government of Venice, and which are formed by water running up in the land. They contain many islands. Venice, for instance, is built on 60 of them. In some places they are deep; in others so shallow that their exhalations are offensive and dangerous. The Austrian government does less toward clearing them out than the former Venetian government did; and Venice in consequence is considerably less healthy than it was. Toward the sea the islets are secured by dams, natural or artificial.

La Guayra, the principal sea-port of the republic of Venezuela, in the province of Caraccas, on the Caribbean Sea, lat. 10° 36' 19" N., lon. 67° 6' 45" W. Population 8000? In 1810, the population is believed to have amounted to 13,000; the reduction being a consequence of the loss of life caused by the tremendous earthquake of 1812, and the massacres and proscriptions incident to the revolutionary war. The population of the city of Caraccas, of which La Guayra may be considered as the port, fell off, from the same causes, from 43,000 in 1810, to 23,000 in 1830; but they are now both increasing. There is neither quay nor mole at La Guayra. Ships moor E. N. E. and W. S. W., with their heads to the north, at from $\frac{1}{2}$ to $\frac{3}{4}$ of a mile from the land, in from 9 to 13 fathoms. The holding ground is good; and notwithstanding the openness of the road, vessels properly found in anchors and cables run very little risk of being driven from their moorings. The principal articles of export are coffee, cocoa, indigo, hides, sarsaparilla, etc. La Guayra shares the trade of Venezuela with the ports of Cumana, Puerto Cabello, Maracaybo, etc., having about a half of its entire amount.

Port Regulations.—On casting anchor, a visit is paid by the collector of customs, or his agent, accompanied by other officers, who take from the master his register, manifest, and muster-roll, and an officer is left on board until the cargo is discharged. The master must swear to his manifest within 24 hours after his arrival,

when the permit to discharge is granted, and within 3 days all invoices must be presented. The discharge completed, the same officers repair on board to examine the vessel, and all being found in order, the officer is withdrawn. The clearing of a vessel outward (that has entered with cargo), in ballast is then completed by paying the port charges; proof whereof being produced, the permission to sail is signed by the governor and harbor master. If the vessel take cargo on board, then the same formality, as to visiting, is pursued, as on the entry of a vessel. Goods imported are almost invariably sold upon credit; those exported are, on the other hand, always sold for ready money. The terms of credit vary from 2 to 6 months, or more. Bankruptcy is very rare.

We subjoin a statement of the principal exports from La Guayra during each of the 5 years ending the 5th October, 1847.

Years ending 5th October.	Coffee.	Cocoa.	Cotton.	Sugar.	Indigo.	Hides.
	Quintals.	Fanegras.	Quintals.	Quintals.	Quintals.	Number.
1843	147,474	28,624	510	3,268	1,074	31,684

Lahore, an extensive province of Hindoostan, situated between the thirtieth and thirty-fourth degrees of north latitude. It has been estimated at 340 miles in length by 200 in average breadth. It is bounded on the north by Cashmere and the course of the Indus; on the south by Delhi, Ajeamer, and Moultan; on the east by the mountains of northern Hindoostan; and on the west it is separated from Afghanistan by

exception of the last two. The charge for water is levied without regard to tonnage; viz., sloops and schooners, \$20 each, brigs, \$30, and ships, \$40. Tonnage employed in the foreign commerce of La Guayra, for six months of 1856, 30,417 tons; See VENEZUELA.

Laguna di Terminos, or Laguna di Carmen, a sea-port on the south shore of the Gulf of Mexico, State of Yucatan, lat. 18° 38' 44" N., long. 91° 51' 22" W. It derives its names from being situated about 1 mile within the south-west extremity of Carmen island, on the most westerly of the straits or entrances leading into the basin or lagoon of Terminos. Population about 3000. The port, which is secure and one of the best on the gulf, has from 12 to 14 feet water over the bar at the entrance to the lagoon. Vessels of greater draught load and unload by means of lighters, outside the bar, in from 3 to 4 fathoms, with good holding ground.

To Enter the Port.—Run in over the bar with Xicalango Point, bearing by compass S. ¼ E., till Point Sacatal bears S. E. ¼ S., and then steer for it; and when the north side of the island begins to shut in haul up for the anchorage off the town. The lead is a safe guide on the west side of the channel, but not on the east. The chief trade of the town consists in the shipping of logwood, known in foreign markets by the name of Campeachy wood, from its having been originally cut down in the vicinity of that port and shipped from it. But Campeachy has ceased to be an entrepôt for logwood. It is now principally cut down on the mainland adjoining the lagoon of Terminos; and being thence conveyed to Laguna in coasting schooners, is sent from it to all parts of the world. Vessels arriving with cargoes must bring a general manifest and invoice in triplicate, certified by the Mexican consul at the port of departure. Those arriving from a foreign port in ballast, must produce a clearance either from the Mexican consul or the authorities of the place from whence they came, showing that they bring no cargo. Pilotage \$1.75 per foot, other port charges, such as harbor-master's fees, anchorage, board of health, etc., about \$25 each vessel. Ships arriving direct from a foreign port pay \$1.50 per ton for tonnage dues. See MEXICO.

the Indus. The principal geographical and territorial subdivisions are the Punjab, comprehending other minor subdivisions, and the Kohistan of Lahore. Rice is cultivated in the narrow valleys, but the inhabitants subsist chiefly on wheat bread, and peas made into a thick soup. Pines and willow-trees grow on the surface of the mountains. The resinous part of the fir is cut into slips, and supplies the place of a

lamp. The climate is not favorable to fruits and vegetables. Fossil salt is found in many parts, and the mountain tracts are supposed to be rich in minerals.

The commerce of this country was formerly much obstructed by the heavy duties levied on all the goods as they passed through the different territories of the petty Sikhs. It was in consequence carried to Hindoostan Proper by the difficult and mountainous route of Jamboe, Nadone, and Serinagem. The Sikh chiefs, however, discovered their error, and many of these heavy and vexatious duties have been reduced; and by a more strict administration of justice, confidence has been restored to the merchants. The exports of Lahore to the countries west of the Indus are, sugar, rice, indigo, wheat, and cotton cloths. The imports from these countries are, swords, horses, fruit, lead, and spices. The exports to Cashmere are nearly the same as to Persia, the imports being shawls, a variety of cloths, saffron, and fruits. With Kohistan the mountainous district of Lahore, the inhabitants of Punjab exchange cloth, matchlocks, and horses, for iron and other small commodities. From the south are imported sulphur, indigo, salt, lead, iron, European coarse broadcloth, and spices. The exports to the south are, horses, camels, sugar, rice, white cloth, matchlocks, swords, and bows and arrows.

Lahore, the capital city of the Punjab, British India, on an affluent of the Ravee, in lat. $31^{\circ} 36' N.$, long. $74^{\circ} 18' E.$ Population estimated at from 100,000 to 120,000. It is inclosed by a double line of defenses, the outer being about 7 miles in circuit. Streets narrow, filthy, and excessively crowded; houses of brick, and lofty. It has many large and handsome mosques, and around it for many miles are extensive Mohammedan ruins, with the fine tomb of the Emperor Jehangire, and the garden of Shah Jehan. Here are also many Hindoo temples, well-supplied markets, and a citadel, containing the palace of the Sikh sovereigns. Under the Mogul emperors, the city was of much greater extent. In 1748, it fell into the hands of Ahmed Shah; in 1798 Runjeet Singh was invested governor and rajah. After the final defeat of the Sikhs, in 1849, Lahore was taken possession of by the British.

Lake, an extensive accumulation of water wholly surrounded by land, and having no direct nor immediate communication with the ocean, or with any seas, or having so only by means of rivers. Lakes are of various kinds, and have been divided into two classes, according to their situation and causes of production. Those which are formed in deep hollows between the ridges or at the bases of the mountains, and which are supplied with water by springs or torrents, are classed together, and those which are formed in low and level countries by the surplus water of rivers, or from a want of sufficient declivity in the ground to allow the waters to continue their course, constitute a second class. Sometimes a chain of lakes is connected with one another and with the ocean by a series of rivers. This is the case with the great lakes on the northern frontier of North America, where basin succeeds basin, on a lower level, like so many locks on a canal. A fourth class of lakes are those which receive streams of water and often great rivers without having apparently any outlet. These lakes are in general confined to warm climates; but the Caspian Sea, the largest of all lakes, belongs to this class. There are a great many others beside in Asia; and South America contains Lake Titicaca which has no efflux, although it receives very considerable rivers into it. Such lakes appear to belong to the interior of great continents; they are placed on elevated plains which have no sensible declivity toward the sea, and which do not allow the water opening for itself a passage through which to flow out.

It was long conjectured that by some subterranean channel lakes of this description communicated with

the sea; but the fact that the surfaces of some of the most remarkable of them, such as the Caspian and the Dead Sea, are depressed below the level of the ocean, is quite sufficient to explode this hypothesis. For were there any communication, however small, the ocean would flow into the lake till it brought it to a level with itself. The true explanation seems to be that a quantity of water equal to that which runs in is carried off by evaporation. The absorption of liquid by the contiguous land, may also materially assist in carrying off the surplus fluid.

Distinct from any of the characteristics of lakes yet alluded to, is the chemical nature of their waters. Lakes in respect to the quality of the waters are distinguished into fresh, saline, and alkaline. Those which receive and discharge considerable quantities of fresh water are almost always kept in a state of perfect freshness; but those which have no outlet are invariably saline. Thus the Dead Sea, whose waters have no efflux, and into which the river Jordan continually flows, contains about eight times as much salt as common sea-water. The waters of the Jordan are brackish, and the neighboring soil is much impregnated with salt, so that the accumulation of such a quantity of saline matter in the lake during a series of ages is by no means surprising, for none of it ever passes off by evaporation. Salt must likewise be accumulating in beds at its bottom; for as soon as water is perfectly saturated, and can hold no more salt in solution, the latter must fall to the bottom. Some of the large Asiatic lakes are dried up during summer, and their beds appear lined with an incrustation of salt. All the great American lakes consist of fresh water; those of Europe are either fresh or slightly saline; but the Caspian Sea, and various others which are situated in plains full of salt, or in tracts of country where salt springs abound, are almost invariably impregnated with that substance. Some lakes are both saline and alkaline, as is the case with the Natron Lakes in Lower Egypt. They derive their appellation from their abounding in soda which is there called trona, and natron, the nitre of the Scriptures. Some lakes produce a pitchy substance. In the island of Trinidad there is one on the surface of which an enormous quantity of bitumen, fit for naval purposes, is collected. Deposits of various kinds besides those enumerated seem to owe their origin to lakes. Bog iron ore, or hydro-phosphate of iron, is often found in such situations as to show that it has been deposited from the waters of lakes; and in some countries it is collected from the sides and bottoms of lakes once in a certain number of years. Calcareous springs are numerous, and when the waters of these collect in a hollow place so as to form a lake, quantities of calcareous sinters and tuffas are deposited, so that the lakes when emptied present extensive deposits of that mineral. The travertine employed at Rome for building, is a lake or spring calcareous deposit of sinter and tuffa.

Lakes, Great American. The following are the principal lakes forming the great chain of inland navigation, extending from the St. Lawrence River to the head of Lake Superior:

Lake Ontario, in shape, approaches to a long and narrow ellipse, being about 190 miles long and 55 wide, with a coast line of about 480 miles. Its surface is 234 feet above tide water, and 330 feet below the surface of Lake Erie. It is in many places over 600 feet deep, so that its bottom is below the level of the Atlantic. In every part it has sufficient depth for the largest vessels, and is rarely frozen, except near the shore. There are many good harbors on the lake. It receives the water of Niagara River, the outlet of the other American Lakes; also the Genesee, Oswego, and Black Rivers. It is connected with the Erie Canal by the Oswego Canal, and has by this means a direct water communication with New York city.

Lake Erie, which is situated 565 feet above the sea,

330 feet above the level of Lake Ontario, is about 265 miles in length, from 80 to 60 miles in breadth, and between 600 and 700 miles in circumference. Its mean depth is 120 feet, being the shallowest of all the great lakes, and most easily frozen. Its waters are also, on account of its shallowness, more readily agitated by storms, causing its navigation to be therefore more dangerous during stormy weather. Disasters, involving large loss of life and property, are not of unfrequent occurrence on the lake, toward the close of navigation, before the rigors of winter have put a final stop to all active lake traffic. The shores of this lake present features very similar to those of Lake Ontario; the banks of Lake Erie being generally bolder and more elevated, and composed chiefly of clay and sand. The more fertile parts are at some distance from the banks, throughout the extensive plain of table-land beyond. There are several good natural harbors along the shore, formed chiefly by the mouths of deep creeks or streams, and protected from the action of storms and current of the lake by strong projecting piers.

Among the harbors of Lake Erie may be mentioned Port Colborne, situated at the entrance to the Welland Canal, at the foot of Lake Erie, and a little above the commencement of the Niagara River. A little further up is the harbor of Port Maitland, at the mouth of the Grand River. This is a very fine and capacious stream, navigable for small vessels a considerable distance, and possessing much fertile land and pleasing scenery along its banks. The shore of the lake for some way above the mouth of the Grand River presents many delightful and fertile settlements. Among the harbors further up the lake are Ports Dover, Burwell, and Stanley. Port Stanley is perhaps the most flourishing of these harbors, being the port of one of the most populous and enterprising districts of this part of Canada, and situated near the centre of the great fertile peninsula. The banks of Lake Erie are here high, and of a sandy character; but off the immediate bank, and extending all the way through the extensive tract of country to the town of Goderich, on Lake Huron, a distance of 85 miles, the soil is of the best quality, being for the most part timbered with beech, maple, black and white walnut, oak, ash, cherry, and other trees, indicating the first qualities of soil. The whole tract is greatly undulating in its appearance, and is everywhere well watered. The upper part of Lake Erie is distinguished by many beautiful islands, the largest of which is Pelee, on which there is a light-house, and several faros. The shores along the upper part of the lake, especially toward the mouth of the Detroit River, have a smiling and luxuriant aspect. Trees of the finest growth rise from the shore, and the wild vine may be seen twining and clustering among the branches of the lesser trees and tall shrubs along the sloping banks. The shore is here covered with fine white sand.

Lake St. Clair.—In our further progress up this country, we pass the Detroit River, thence into Lake St. Clair, then the River St. Clair, which last opens into the broad expanse of Lake Huron. From the head of Lake Erie to the foot of Lake Huron, is a distance of between 80 and 90 miles, through a country of unsurpassed fertility and luxuriance, and possessing many delightful features. The Detroit River, about 27 miles in length, is interspersed with many islands, several of which, near its entrance into Lake Erie, are beautifully wooded. The towns of Amherstburg and Sandwich, and the small village of Windsor, are situated along the Canada side of this river. Opposite Windsor, toward the upper part of the river, and where the banks narrow to about three quarters of a mile, is the American city of Detroit, in the State of Michigan. Lake St. Clair, which forms the connecting link, by means of the St. Clair and Detroit Rivers, between Lakes Huron, Michigan, and Erie, is

the smallest of all the lakes, and exceedingly shallow for the larger class of vessels passing through it. It is from 20 to 30 miles in length, and about the same in breadth. Its average depth is about 20 feet, but the principal channel used by vessels passing through it is much shallower, especially in dry seasons, when the mud of its flats is stirred to the surface not unfrequently by large vessels. The chief stream which it receives from the Canadian shore is the River Thames, which is navigable for lake vessels 22 miles from its mouth, and the banks of which are exceedingly fertile, and mostly well settled. Much of the land bordering on the lake is low and marshy. In the upper part of the lake are several islands, the principal of which is Walpole Island, about 10 miles long, and from 3 to 4 miles wide. This island is inhabited by a stray portion of the remnant of Indians still existing in small and decreasing numbers in Canada. We are now at the entrance to the River St. Clair, in length about 30 miles. There are several thriving settlements along the fertile and beautiful banks of this river. Toward the lower part, amid a cluster of wooded islands, the banks, with somewhat of a flat appearance, are covered with luxuriant timber. Further up, the land rises, with finely sloping banks and cultivated farms. Near the head of the river, and pleasantly situated, is the flourishing town of Sarnia.

Lake Huron.—The River St. Clair now opens to the wide expanse of Lake Huron, of about 1000 miles in circumference. This vast sheet of inland sea is the second in point of size of the great lakes, yielding only in this respect to Lake Superior. The surface of Lake Huron is about 30 feet above the level of Lake Erie, and 595 feet above the level of the Atlantic. The length may be estimated at 250 miles, and its breadth 160 miles, inclusive of the Georgian Bay, a large wing of the lake, extending along the north-eastern shore for a distance of about 100 miles. The mean depth of Lake Huron is 900 feet, and its greatest depth 1000 feet near the west shore. This lake is said to contain the almost incredible number of 32,000 islands, principally along the northern shore and at the north-western end, varying in size from mere rocky reefs and pinnacles to large and cultivable islands. The Great Manitoulin, the longest of the islands, is upward of 75 miles in length, and varies in width from 3 to 23 miles. The waters of the lake are remarkably pure, clear, and cold; in these respects resembling the great upper Lake Superior. The surface of Lake Huron is about 32 feet lower than that of Lake Superior, and it is very nearly as deep as that lake. The nature of the banks of Lake Huron vary very much. In parts they are low and sandy, in others formed of clay; they rise to a height of about 120 feet, while again the shore of this inland sea presents a bold, rocky, iron-bound coast, having great depth of water to the base. Numerous streams descend on all sides into the lake; and among its rivers may be mentioned the Maitland, Severn, and River François. The lake, which is rather subject to storms, is deficient in good and natural harbors, the principal of which, along the eastern coast, are Goderich, at the mouth of the Maitland, Saugeen, and Penetanguishene; and on the western shore the best places of shelter in heavy weather are Thunder Bay and Saginaw Bay.

Lake Huron possesses the advantage of being remarkably centrally situated with respect to the other great lakes. With Lake Erie, as we have seen, it is connected by the Straits or Rivers St. Clair and Detroit, and the small Lake St. Clair. Lake Ontario, the lower of the lakes, is even open to it by the River Severn, Lake Simcoe, then by a short portage, a chain of lakes, and Trent River. Lake Simcoe, thus situated between Lake Huron and Lake Ontario, is a very beautiful lake, about 30 miles in length and 20 in breadth. The neck of land south of Lake Simcoe from Holland River leading to Toronto is, it will be

remembered, about 36 miles; and again, north of Lake Simcoe, from the narrows of this lake to Lake Huron, the portage is only about 14 miles. The new railway now cutting through this neck of the peninsula westward, situated between the Lakes Erie, Ontario, and Huron, will greatly facilitate the growing intercourse between the shores of Ontario, as well as all the country lower down along the banks of the St. Lawrence, and also great part of the United States, with the regions of the great upper lakes, Huron and Superior. This direct course will no doubt be much preferred to the circuitous route through Lakes Erie and St. Clair, and the connecting rivers.

Lake Huron, besides, communicates with the Ottawa, and thence with the St. Lawrence above Montreal, by means of French River, Lake Nipissing, and the River Mattawa, into the Ottawa. This is the route adopted generally by the north-west traders in proceeding to the remote parts of the country, and it is also the one by which Europeans first penetrated the West. The distance from Montreal by this route to Lake Huron is fully more than one half shorter than that by the St. Lawrence. From Montreal to the Georgian Bay, the distance is estimated at 400 miles, while by the St. Lawrence the distance is upward of 1000 miles. Again, Lake Huron communicates with the great upper Lake Superior by means of the River St. Mary, about 40 miles in length. Lastly, we have this centrally situated lake communicating by the straits of Mackinac with Lake Michigan, and thence by the Illinois River and Canal with the Mississippi and Gulf of Mexico. The shores of Lake Huron have of late revealed important mineral treasures. The Bruce copper mines promise to be of great value. These mines are situated upon the northern shore of the lake under the Cloche Mountains, a bold range of hills extending about 40 miles along the coast. Along the south-eastern shores of the lake, extending beyond the town and harbor of Goderich, on the River Maitland, are many highly prosperous settlements. The lands in this direction, and through the large and fine district inland, are believed to be the most fertile in Canada. The country is everywhere well watered, and enjoys much delightful scenery, both along the elevated banks of the lake and the beautiful rivers which diversify it. The town of Goderich, on the River Maitland, is very agreeably situated, and possesses an excellent harbor. The high banks of the Maitland are exceedingly picturesque.

Lake Superior.—We now approach the uppermost of these vast collections of water, not inappropriately named inland seas. The River or Strait of St. Mary, connecting Lake Huron with Lake Superior, is between 30 and 40 miles in length. The character of the scenery, on entering St. Mary's Channel, is the most delightful that can be imagined. The channel throughout, with the exception of several small lakes, seems to be almost packed with islands; and while perplexing the navigator by its intricacy, it is every now and then revealing new and striking beauties of wooded heights and steep banks clothed with verdure, and spots of flat, fertile meadows, and, at times, bare, rocky, fantastic crags. The sides of the ridges of table-lands that skirt the country, around the borders of Lake Superior, appear in the distance clothed with one mass of lively green. The foot of the Falls, or, more properly speaking, Rapids of St. Mary, approach within about 18 miles of Lake Superior. The region in this direction seems much less fertile; the trees along the shores of the broad strait appearing to be chiefly of the pine species, and the soil in many parts light and sandy, while the lands close upon the banks lie for the most part low and flat. We now approach the chief seat of the great copper district of America, where the barrenness of a large portion of the country is richly compensated by the value of the metals with which it abounds. The copper mines of Canada, along

the shores of Lakes Huron and Superior, are perhaps entitled to rank among the most valuable resources of this great country.

As we approach the great queen lake or inland sea, upward of 400 miles in length and 180 in breadth, dark blue masses of hills uprise, somewhat reminding the voyager of the approaches to the St. Lawrence in the forms of the headlands of Cape Rozière and others, yet being neither so high nor so bold as these. The main entrance to the lake is marked by two such rocky headlands, one upon either shore several miles apart. From the heights of the one on the other shore, named Gros Cap, composed of the rock of the old red sandstone, the sides of which are partially covered with junipers, blue bells, wild briars, and other vegetation, reminding one of the Scottish hills, we overlook a scene of the most imposing and still grandeur possible to be imagined. The dim distance into the lake is bounded by vast islands, and along both shores bold uneven banks uprise, apparently covered with dark dense foliage, and stretch themselves in irregular course, as far as the eye can reach, along the wide expanse of water that scarcely as yet presents any speck of navigation. The shores of Lake Superior, which are even now imperfectly explored, already prove to be abundant in mineral resources. Many of the enterprising inhabitants of Canada, having formed themselves into associations, are now engaged in mining the seemingly inexhaustible treasures of virgin copper which are found along the shores of this lake as well as Lake Huron. This source of wealth to the colony is likely to prove of considerable importance.

Lake Superior, which is the largest sheet of fresh water on the face of the globe, is the most remarkable of the great American Lakes, not only from its magnitude, but also from the picturesque scenery of its borders, and the interest and value attaching to its geological features. "As a mining region," continues Dr. Jackson, who, as United States' geologist, was intrusted by his government to survey the territory, "it is one of the most important to this country, and is rich in veins of metallic copper and silver, as well as in the ores of those metals. At the present moment it may be regarded as the most valuable mining district in North America, with the exception only of the gold deposits of California. The whole coast of Lake Superior is rock-bound. Mountain masses of considerable elevation in some places rear themselves from the immediate shore, while steep precipices and frightful crags oppose themselves to the surges of the mighty lake, and threaten the unfortunate mariner who may be caught in a storm upon a lee shore with almost inevitable destruction. The northern or Canadian shore of the lake is the most precipitous, and consequently most dangerous to the navigator. Good harbors for vessels of moderate capacity are comparatively few, but there are abundance of coves or boat-harbors formed by the countless indentations of the rocky coast. In remarkable contrast to Lake Huron, which is thickly studded with islands, there are very few islands in Lake Superior.

Agriculture may be truly said to have not yet commenced to tame the great and comparatively unexplored wilderness around the shores of Lake Superior. The forests of stunted spruce and fir-trees along the immediate coast of the lake are said to afford a very inadequate idea of the agricultural resources of the shores of the great queen lake. The cold air from the lake, says Dr. Jackson, affects only the vegetation near its shores, while further inland the temperature more resembles that of the settled parts of Canada. The native forest trees, and also the flowering plants, as well as the agricultural produce where clearings have been made, are believed to afford very satisfactory evidences on this point. The forests are filled with excellent timber for building purposes; the

white and yellow pines, particularly, being of large dimensions. "The tributary rivers of Lake Superior are numerous," says Mr. I. D. Andrews, in his very interesting report to the United States' Senate, "and, bringing down a large volume of water, afford superabundant water-power for manufactories the most extensive in the world, though, from the precipitous descents and numerous falls and chutes, they can never be rendered navigable for more than a few miles above their mouths, except for canoes."

Lake Michigan, one of the five great lakes of North America, lies between $41^{\circ} 38' 58''$ and 46° N. lat., and between $84^{\circ} 41'$ and $87^{\circ} 8'$ W. long. In the northern parts it communicates with Huron by the Straits of Michilimackinac or Mackinac, about four miles in width in its narrowest part, and by which and its northern part it separates the two peninsulas of Michigan. Michigan Lake is the largest lake that lies wholly within the United States, being 380 miles long, and, on an average, 60 miles broad, containing 16,981 square miles, or 10,868,000 acres. It has Green Bay, a large branch on the north-west; and on the east, Grand Traverse Bay and Little Traverse Bay. It is estimated to be on an average 900 feet deep; and is elevated about 300 feet above tide-water. It has few good harbors. On the west side are those of Chicago, Milwaukee, and Green Bay. On the east side are Michigan City, St. Joseph, at the mouth of St. Joseph River, and Grand Haven, near the mouth of Grand River. It is navigated by many large vessels and several steamboats, which ply from Buffalo to

Lake Erie and Chicago, stopping at the intermediate places. It affords great facilities for transportation. The lake has pure and clear water, and abounds with excellent fish. There are several islands on its northern part. It has 23 light-houses and 4 beacons on its islands and coasts. The Illinois and Michigan Canal connects the navigable waters of the Illinois River with Lake Michigan.

Commerce of the Lakes.—These lakes are estimated to drain an entire area of 835,515 square miles, and discharge their waters into the ocean through the River St. Lawrence, which is rendered navigable from Lake Erie downward to all vessels not exceeding 130 feet keel, 26 beam, and 10 feet draught, and the free navigation of which for American bottoms was recently acquired by the concession of reciprocity of trade to the Canadian government. The whole traffic of these great waters may be now unhesitatingly stated at \$326,000,000, employing 74,000 tons of steam, and 188,000 tons of sail, for the year 1851, of 215,000 tons burden.

The entire number of vessels and crews of the interior trade amounts to 140 bottoms, and 5,837 men, in excess of the whole ocean and coast navy, though the tonnage employed in the latter is smaller by 7,775 tons.

However remote the period of the discovery, exploration, and partial colonization of these wilds and waters, any thing like practical navigation of them for commercial purposes was unattempted until after the commencement of this century. In 1679 a French craft indeed was launched at Erie, Pennsylvania, for the expedition of the celebrated and unfortunate La Salle.

Welland.....	28	10	150×26½	330	27

The great lakes are about 1-25th of the area of the

Atlantic Ocean; but in proportion afford much greater facilities for commerce, in consequence of the advantage of great length with less width, and of greater proportion of shore line. The country forming the shores of the lakes can not be surpassed in general productiveness by any section of the Union, either in variety of important commodities, or in quantity produced per square mile. The extent of the commerce of the lakes may be estimated by the commerce of the lake ports. During the past 15 years the value of the trade of the lakes has swelled from \$65,000,000, in 1841, to \$608,310,320, in 1856; and the whole of this grand aggregate, with the exception of \$42,260,060, set down for Sackett's Harbor, Cape Vincent, Oswegatchie, Genesee, and Niagara, came through the following ports:

Buffalo.....	\$303,023,000	Milwaukee...	\$85,000,000
Chicago.....	228,598,000	Maumee.....	94,107,000
Cleveland.....	162,185,000	Sandusky.....	59,966,000
Detroit.....	140,000,000	Oswego.....	146,235,000

With the exception of Buffalo and Oswego, these are all ports of the north-west, whose trade has been the result of its development during a very brief period; and the great bulk of the trade of Buffalo and Oswego is derived from the same cause.

The tonnage employed on the great lakes is shown

in the following table, and does not include any ocean or river tonnage:

	Tons.		Tons.
Illinois.....	1,742	Ohio (Lake tonnage)	11,856
Wisconsin.....	1,451	New York.....	22,534
Michigan.....	7,848	Total.....	45,426

This is 1-12th of the total tonnage owned by the United States, and about 1-5th of the total amount employed in the coasting trade. The first steamer launched on Lake Ontario was in 1816, while on Lake Erie steam navigation commenced in 1814. In 1851 the proportion of steam craft to sailing craft was as 74,000 to 183,000 tons. The number of Canadian

steamers and schooners now trading on Lake Ontario is 294, of which 48 are steamers, 17 propellers, and 169 schooners, the tonnage of which amounts to about 42,000 tons, and their value is about £378,000. The whole tonnage owned on the lakes in 1820 amounted to but 5,500 tons, in 1840 to 70,000 tons, in 1850 to 215,787 tons, and in 1855 to 845,000 tons. But even this rapid increase hardly conveys an idea of the vast commerce of which these great inland seas are destined to become the scene even before the close of the current century. The liberal provisions of existing treaties with England and her American colonies, will rapidly develop the resources of Canada and the N. States.

LOSS OF LIFE.

Loss of life.....	1854.	1855.	1856.
	119	118	407

This shows an increase in the loss of life during the past year over that of 1855 of 289.

The increased facilities for saving wrecked property has lessened the actual amount of loss on property in distress at least 25 per cent. during the past severe season; as the proportion of total losses to the whole number of disasters will show when compared with 1855.

SYNOPSIS OF THE MARINE REGISTER OF THE BOARD OF LAKE UNDERWRITERS OF VESSELS IN COMMISSION ON THE LAKES IN THE FALL OF 1856.

Vessels.	No.	Tonnage.	Cash Value.
Steamers.....	107	62,863	\$3,820,400
Propellers.....	135	54,675	2,741,200

Lamar, formerly COBIJA, a sea-port of the republic of Bolivia, the ci-devant Upper Peru, on the west coast of South America, lat. 22° 39' 30" S., long. 70° 12' W. Population 5000. In 1833 Lamar was declared a free port, and in it centres almost the whole foreign trade of the republic. Its situation is, however, very unfavorable. It labors under a great want of fresh water; and is obliged to import all its provisions by sea, either from Valparaiso on the one hand, or from Arica on the other. The Desert of Atacama lies between it and the internal and populous part of the country, where the towns of Potosi, Cochabamba, Charcas, etc., are situated. The produce imported at Lamar is conveyed across the desert on the backs of mules to the interior; the gold and silver of the mines being brought in the same way to the port to be shipped. These, with copper, saltpetre, chinchilla-skins, and wool, form the principal articles of export. Saltpetre is found in large quantities in the desert; the copper is found near the coast, and, owing to the scarcity of fuel, most part of it is exported in the shape of ore. Peru possesses a long narrow strip of land, stretching along the coast of the Pacific from Arequipa to the Bay of Pica, which ought naturally to belong to Bolivia, being, in fact, the *littoral* of the latter. The Bolivian government has set on foot various negotiations to obtain the cession of this tract, which, besides greatly improving the frontier of the republic, would, at the same time, render her mistress of Arica, which is in all respects much better fitted than Lamar for

becoming the entrepôt of trade. Hitherto, however, these negotiations have proved abortive, so that, as already stated, Lamar at present engrosses most part of the foreign trade of the State. We subjoin the decree constituting Lamar a free port:

1. From and after the 1st of July of this present year, 1833, Port Lamar shall be absolutely free and open. 2. Vessels of every nation may enter this port, and remain as long as they please, without being subjected to any tax whatever, either on entrance, or during their stay, or on their departure. 3. They shall be free from all duties of anchorage, tonnage, shifting, unloading, or reloading of cargo, deposit, storage, or any other of whatever denomination. 4. Goods may be deposited in private warehouses, without any intervention on the part of the government. 5. The custom-house of Port Lamar is suppressed. In its stead will be a commissioner's office, for the purpose of distributing permits for the transportation of goods into the interior. 6. Whenever goods are to be sent into the interior, they must first be submitted to the commissioner, together with the invoice corresponding. 7. The commissioner will register them in a book, together with their valuation, made by two merchants of the place, and the name of their owners, of the person to whom, and the place where they are to be sent. This is to be signed by the person entering the goods, who, at the same time, binds himself to have them transported direct to the custom-house for which they are destined, without opening any of the cases, bags, or other envelops, each of which shall be sealed, marked, and numbered before departure. These points are to be expressed in the permit. 8. The commissioner shall by the earliest post send a notice to the collector of the custom-house for which any merchandise is destined, specifying the numbers, characters, quantities, and qualities of the several articles. 9. The goods must not be carried by any unaccustomed roads, but only through Calama and the public thoroughfares; and whenever they pass through any place at which a guard or commissioner is stationed, the permits must be exhibited, in order that their arrival with their seals unbroken may be ascertained. 10. Merchants, either in person or by a representative, must produce to the commissioner of the port a certificate of the delivery of the goods at the custom-house for which they are destined within six months from the day of their entry; in case they do not, they must at the end of that period pay the whole of the duties on them. 11. From and after the 1st of July, 1833, all goods entered at Port Lamar shall pay a duty of only 5 per cent. over and above that of half per cent. to the consular. 12. The duty of 5 per cent. shall be paid thus: at the port, 2 per cent. on the valuation made as aforesaid; and the other 3 at the custom-house in the interior for which the goods are destined. In each case, one half at the end of 3, the other half at the end of 5 months. 13. All goods carried from Port Lamar by land to any of the adjacent republics shall only pay a transit duty of 2 per cent. 14. A duty of 2 per cent. shall be paid on three fourths of all gold and silver money entered at any of the custom-houses in the interior for exportation through Port Lamar. 15. It is absolutely prohibited to export gold or silver in bullion or plate, except in small quantities for the use of the person carrying it out. It will be seized wherever it is found on this side the districts of San Antonio, San Vincente, Atoca, Agua, de Castilla, Leguapate, or the line of the canal. 16. All hardware for agriculture and mining machinery, instruments of science or the arts, iron, steel, quick-silver, and moral books, may be introduced free of duty into the republic, and productions of Bolivia may be exported likewise free. 17. A premium of 2 per cent. on their value shall be allowed on the exportation through Port Lamar, of cascarilla, wool, tin, cocoa, and coffee, in the shape of remission from duties to the amount on goods carried into the interior from the same port. The remaining articles of the Decree are of a purely local nature. See BOLIVIA and PERU.

Lamb-skins (Ger. *Lammshelle*; Fr. *Peaux d'agneaux*; It. *Pelli agnelline*; Sp. *Pielles de carderos*). The value of lamb-skins varies according to the fineness, brilliancy and color of the wool. Black lamb-skins are more generally esteemed than those of any other color. English lamb-skins are seldom to be met with perfectly black; but since the introduction of Merino sheep into this country, many of the white fleeces have, in point of quality, arrived at a pitch of perfection which justly entitles them to be ranked with some of the best fleeces in Spain. The importation of lamb-skins is immense. Eight tenths of the whole quantity are supplied by Italy. They are mostly used in the glove manufacture.

Lamp (Ger. *Lamps*; Fr. *Lampe*; It. *Lucerna*; Sp. *Lampara*; Rus. *Lampadu*), an instrument used for the combustion of liquid inflammable bodies, for the purpose of producing artificial light. Lamps are mentioned in all the early ages: they were in use in Egypt, Greece, and Rome. The earthen lamp which Epictetus the philosopher had in his study sold after his death for 3000 drachmas, A. D. 161. Lamps with horn sides were the invention of Alfred. Lamps were in general use through the streets of London up to the close of the 18th century, as were flambeaux, which were carried by link-boys. London streets were first lighted by oil-lamps in 1681, and with gas-lamps in 1814. The domestic lamp is now of elegant manufacture; of this kind is the Argand lamp, brought into general use in England in 1785.—*Haydn*.

It is unnecessary to give any description of instruments that are so well known. We may, however, remark that the discovery of Sir H. Davy, who, by covering the flame with wire gauze, succeeded in producing a lamp that may be securely used in coal mines charged with inflammable gas, is one of the most ingenious and valuable that has ever been made. The following extracts from a communication of the late Mr. Buddle, an able and well-informed coal engineer, evince the great importance of Sir Humphrey Davy's invention: "Besides the facilities afforded by this invention to the working of coal mines abounding in fire-damp, it has enabled the directors and superintendent to ascertain, with the utmost precision and expedition both the presence, the quantity, and correct situation of the gas. Instead of creeping inch by inch with a candle, as is usual, along the galleries of the mine suspected to contain fire-damp, in order to ascertain its presence, we walk firmly on with the safe lamps, and, with the utmost confidence, prove the actual state of the mine. By observing attentively the several appearances upon the flame of the lamp, in an examination of this kind, the cause of accidents which happened to the most experienced and cautious miners is completely developed; and this has hitherto been in a great measure matter of mere conjecture. It is not necessary that I should enlarge upon the natural advantages which must necessarily result from an invention calculated to prolong our supply of mineral coal, because I think them obvious to every reflecting mind; but I can not conclude without expressing my highest sentiments of admiration for those talents which have developed the properties and controlled the power of one of the most dangerous elements which human enterprise has hitherto had to encounter."

The lamps now used for light-houses are highly ingenious, and beautiful. In the first place, it is necessary to distinguish between two systems—the *catoptric* and the *dioptric*—the former depending on the reflection of light from a mirror, and the latter on the transmission of light through a lens. If a large lamp were placed on the top of a light-house, with glass roof and windows all around it, the light would shine in every direction, losing its intensity by being so much diffused; but by the use either of mirrors or of lenses, all the light is concentrated to one definite direction; its energy is increased by being circumscribed in range. In the catoptric system, numerous concave reflectors are placed at definite angles round a central lamp: they are of silvered copper, and are kept exquisitely bright; and they all contrive to reflect the rays out seaward, without allowing any to waste their power landward. The dioptric system involves the use of powerful convex lenses, through which the rays are focalized in a definite direction. If very large, these lenses would be difficult to make and costly to purchase; but it has been shown by Brewster and Fresnel, that a compound lens may be built up of a number of pieces, provided the curvatures are well adjusted. Around thousands of miles of coast,

where the annual wrecks are from 700 to 800, and the property lost amounts to millions sterling, the light-houses have passed through many stages of efficiency. First there was the large coal fire used on the summits of open buildings, then the old-fashioned oil lamps, or sometimes wax candles, with a looking-glass reflector behind; then the more brightly-burning Argand lamp, with concave metallic reflectors behind; then the convex lens, to focalize the rays by transmission; and then the lens built up piecemeal, so that the light may appear almost as one vast luminous pillar. See **LIGHT-HOUSES**.

Lamp-black (Ger. *Kienruss*; Fr. *Noir de fumée*, *Nero di fumo*, *Negro-fume*, *Negro de humo*). The finest lamp-black is produced by collecting the smoke from a lamp with a long wick, which supplies more oil than can be perfectly consumed, or by suffering the flame to play against a metalline cover, which impedes the combustion, not only by conducting off parts of the heat, but by obstructing the current of air. Lamp-black, however, is prepared in a much cheaper way for the demands of trade. The dregs which remain after the eliquation of pitch, or else small pieces of fir-wood, are burned in furnaces of a peculiar construction, the smoke of which is made to pass through a long horizontal flue, terminating in a close boarded chamber. The roof of this chamber is made of coarse cloth, through which the current of air escapes, while the soot remains.—*URE's Dictionary*.

Land, in sea language, makes part of several compound terms; thus, *laying the land*, denotes that motion of a ship which increases its distance from the coast, so as to make it appear lower or smaller on account of the intermediate convexity of the sea. *Raising the land*, is produced by the motion of the vessel toward it. *Land is shut in*, signifies that another part of the land hinders the sight of that the ship came from. *Land to*, or so far from shore that it can only be just discerned. *Land turn*, a wind that in almost all hot countries blows at certain times from the shore in the night. *To set the land*; that is, to see by the compass how it bears. *Land-breeze*, a current of air, which in many parts within the tropics, particularly in the West Indies, regularly sets from the land toward the sea during the night, and this even on opposite points of the coast. *Land-locked*, is said of a harbor which is environed by land on all sides, so as to exclude the prospect of the sea, unless over some intervening land. If a ship is at anchor in such a place, she is said to ride land-locked, and is therefore considered to be safe from the violence of winds and tides. *To make the land*, is to discover it after having been out of sight of it for some time. *Land-mark*; any mountain, rock, steeple, or the like, near the sea-side, which serves to direct ships passing by how to steer so as to avoid certain dangerous rocks, shoals, whirlpools, etc.

Land, Public. Grants of public land to certain States for railroads, made at the last session of the 34th Congress, 1855-'6.—*To Iowa*, a grant of the alternate sections designated by odd numbers, for six miles in width on each side of certain railroads named in the act; and, in case any of such sections shall have been sold, or become subject to pre-emption, then the limit of selection is extended to *fifteen miles* on each side, to make up the deficiency so caused. The alternate sections remaining to the United States within *six miles* on each side not to be sold for less than double the minimum price of other public lands—\$1 25 per acre. Troops and other property of the United States to be transported free upon the railroads—mails to be carried at such rates as Congress may prescribe, and, until so fixed, at such rates as the Postmaster-General may allow.

At the second session of the same Congress, 1856-'7, a like grant was made to Minnesota and to Alabama. The quantity of land granted in each case is over 3000 acres per mile of railway.

In the first grant made to Alabama, there does not seem to be any increase of the price of the sections retained by the United States, that provision of the law not being fairly construable as one of the terms or conditions of the grant. In all these grants, it will be observed, the States are authorized to make their selections as far as *fifteen miles* on each side of every railroad, while the increase in the minimum government price of the retained lands is confined to the *six mile* limit. The public lands, in all the above-named States, particularly in Iowa, Alabama, Mississippi, Louisiana, Wisconsin, and Michigan, having been sold or pre-empted to a great extent, it is manifest that the selections for all the named railroads will range, more or less, to the maximum limit of 15 miles on each side of them. The increase in the minimum price, therefore, does not apply in a width of *nine miles* on each side. This seems to give up the argument that the only consideration which moved Congress to make these grants was such as would actuate any large holder of unoccupied land to give away part to enhance the value of the residue; for if the land is not improved in value for the full extent of the 15 miles, what right have Congress to make such a grant for such a reason?

The immense donations of public land made of late years by Congress to corporations within the new States, have awakened the attention of the people of the old States to the subject, and of Virginia, especially, where the burden of taxation for internal improvements has been greatly increased. It strikes us, therefore, that a brief recurrence to the history and conditions of the tenure of the public domain may be of general interest at this time.

At the commencement of the Revolutionary War, there belonged to some of the States large tracts of wild and unappropriated lands, while in others none such existed; the States possessing no such lands, claimed that as the war was waged with united means and equal sacrifices, the waste lands which might be conquered from the enemy should become common property, and, under the recommendations of Congress, 10th October, 1780, "that the unappropriated lands which might be ceded to the United States, by any particular State, pursuant to the recommendation of Congress of the 5th of September last, shall be disposed of for the common benefit of the United States."

Virginia promptly made a cession of her vast domain north of the River Ohio, out of which six States have since been formed. The condition of her cession (adopted substantially by other States) was, that all the lands conveyed "shall be considered as a *common fund* for the use and benefit of such of the United States as have become or shall become members of the confederacy or federal alliance of the said States, Virginia inclusive, according to their usual respective proportions in the general charge and expenditure, and shall be faithfully and *bona fide* disposed of for that purpose, and for no other use or purpose whatever." Thus were the lands ceded, accepted, and held in trust. How they have since been disposed of, in total disregard of the conditions of the trust, the history of the country tells in the annals of Congressional legislation.

In disregard of the plain obligations of the trust, President Jackson, in the early days of his administration, proposed to cede the lands thus acquired, and all subsequently purchased, to the States in which they lie, gratuitously, or for a nominal price.

To counteract this movement, which at that time met with no favor in Congress, but which has since been substantially adopted in the system of partial grants, Mr. Clay introduced his well-known distribution bill, which was passed by Congress on the 2d day of March, 1833, by a vote of 24 to 20 in the Senate, and 96 to 40 in the House of Representatives. This bill President Jackson refused to approve, and it did

not become a law, the popular will, as indicated by the vote of the House, to the contrary notwithstanding. Some of the western members did not hesitate to avow the purpose of eventually appropriating to the States in which they lie all the public lands, and one of the most eminent of them declared that, after the census of 1820, the power to do so would be irresistible. The fulfillment of this menace is almost complete, and after the census of 1860 the old States will be utterly powerless unless they unite cordially for their common protection.

The whole amount of money which would have gone into the Treasury of Virginia, under the provisions of Mr. Clay's land bill from 1832 to 1839, a period of seven years, would have been \$4,369,169, or for each year, \$728,194.

On September 4, 1841, an act was passed to appropriate the proceeds of the sales of the public lands among the several States. The first section provided that from and after the 31st of December, 1841, there should "be allowed and paid to each of the States of Ohio, Indiana, Illinois, Alabama, Missouri, Mississippi, Louisiana, Arkansas, and Michigan, over and above what each of the said States is entitled to by the terms of the compacts entered into between them and the United States, upon their admission into the Union, the sum of ten per centum upon the nett proceeds of the sales of the public lands, which, subsequent to the day aforesaid, shall be made within the limits of each of said States respectively." We give below a statement, showing the quantities of public land disposed of, and also the quantities vacant.

* Includes reserves under deeds of cession.

† Includes the quantity of 541,625 acres of the Des Moines River Grant above the Raccoon Fork.

‡ Is the estimate of the Des Moines River Grant, within this Territory.

§ Reported by the State's authorities.

¶ Estimated.

Land-waiter, an officer of the English custom-house, whose duty it is, upon landing any merchandise, to taste, weigh, measure, or otherwise examine the various articles, etc., and to take an account of the same. They are likewise styled searchers, and are to attend, and join with, the patent searchers, in execution of all caskets for the shipping of goods to be exported to foreign parts; and, in cases where drawbacks or bounties are to be paid to the merchant on

the exportation of any goods, they, as well as the patent searchers, are to certify the shipping thereof on the debentures.

Laniard, or **Lanyard** (from *Lanier*, Fr.), a short piece of cord or line fastened to several machines in a ship, and serving to secure them in a particular place, or to manage them more conveniently. Such are the lanyards of the gun-port, the lanyard of the buoy, the lanyard of the cat-hook, and others. The principal

lanyards used in a ship, however, are those employed to extend the shrouds and stays of the masts by their communication with the dead eyes, so as to form a sort of mechanical power resembling that of a tackle. These lanyards are fixed in the dead-eyes as follows: one end of the lanyards is thrust through one of the holes of the upper dead-eye, and then knotted to prevent it from drawing out; the other is then passed through one of the holes in the lower dead-eye, whence returning upward, it is inserted through the second hole in the upper dead-eye, and next through the second hole in the lower dead-eye, and finally through the third hole of both dead-eyes. The end of the lanyard being then directed upward from the lowest dead-eye, is stretched as stiff as possible by the application of tackles; and that the several parts of it may slide with more facility through the holes of the dead-eyes, it is well smeared with hog's-lard or tallow, so that the strain is immediately communicated to all the turns at once.

La Perouse, a celebrated French navigator. His first voyage was commenced in 1785, when Perouse sailed from France for the Pacific with the *Boussole* and *Astrolabe* under his command. The last direct intelligence received from him was from Botany Bay, in March, 1788. Several expeditions were subsequently dispatched in search of Perouse, but no certain information was had until Captain Dillon, of the East India ship *Research*, ascertained that the French ships had been cast away on two different islands of the New Hebrides—a fate authenticated by various articles of the wreck of these vessels, which Captain Dillon brought with him to Calcutta, April 9, 1828, 40 years afterward.

Lapidary, a name given to the artist or artisan whose business it is to cut, grind, and polish gems, small stones, etc., for the purposes of jewelry, and also for mineralogical specimens. The name, derived from *lapidarius*, pertaining to stones (from *lapis*, a stone), would seem to include the various modes of working or finishing stones in general; the technical use of the word, however, is limited as above noticed.

Lapis Lazuli. See ULTRAMARINE.

Lapland, the most northerly country of Europe, is bounded north by the Arctic Ocean, south by Sweden, east by the White Sea, and west by Norway and the Atlantic Ocean. Its limits are not very accurately laid down by geographers; but it seems to be divided from the rest of Scandinavia by a line nearly corresponding with the polar circle, in latitude $66^{\circ} 32'$, and is consequently almost entirely an arctic region. North Cape, its most northerly point, is situated in N. lat. $71^{\circ} 10' 15''$, consequently its length from north to south, is about 380 miles, and not 500, as is usually stated. From Cape Orlov, on the White Sea, to the Atlantic on the west, it extends about 700 miles; but besides this continental territory, there are a vast number of islands, which are included in the general name of Lapland. The whole country is divided into three parts, called Russian, Swedish, and Norwegian Lapland or Finmark, and is recognized by the Swedes and Norwegians by the name of Lapmark, *mark* signifying, both in Swedish and Norse, land or tract of country. The very early writers, however, do not notice any country under the name of Lapmark, while Finmark is alluded to, though not with such clearness as would admit of our defining the exact extent of country which went by that appellation. It has been conjectured that, in former ages, the parts of the north now known by the names of Swedish and Russian Lapland were distinguished as Russian and Swedish Finmark previously to the period when the Finns obtained the name of Lapper, or Laplanders.

Finmark, which forms the most northern part of this wild and extensive territory, constitutes one extremity of the kingdom of Norway, to which it now belongs, though doubtless in ancient times it was a separate kingdom, governed by its own sovereigns.

Its present boundary on the west is Loppen, the first island in Finmark, and which forms a line between it and the Nordlands, a part of Norway sometimes erroneously confounded with Lapland. On the north-west and north-east it is washed by the Polar Ocean, while to the east it is bordered by Russian Lapland, which also, with Nordland, bounds it to the south—the boundary line between the two countries being the River Tana. Its extent from north to south—that is, from the borders of Russian Lapland to the North Cape—is nearly three degrees of latitude; its greatest breadth being from west to east, namely, from the western side of Faroe to the coast above Waranger, near the borders of Russian Lapland. At the eastern extremity of Finmark there is a considerable tract, to which both Norway and Russia lay claim. It lies between the acknowledged boundaries of each of these powers, and being now considered as neutral ground, is free to the Laplander of both countries to hunt and fish in. This district extends a little to the westward of Bugefiord, stretching nearly south to the Enara Lake, where it bends to the east, and afterward to the N.E., where it joins the coast. Russian Lapland lies to the south and east of the debatable ground above mentioned. The river Muonio, which for a considerable portion of its early course receives the name of the Kõngärnäel, constitutes the boundary between Sweden and Russia. The circle of Kola, and the northern part of eastern Kemi, constituted at one time Russian Lapland; but, by subsequent treaties, two extensive districts, all the Lapmark of western Kemi, and the greater part of the Lapmark of Torneo, have been ceded to Russia. Thus nearly two thirds of the regions inhabited by the Laplanders are included in the dominions of the Emperor of Russia. Swedish Lapland, the most southerly division, occupies the interior part of the country to the west of the River Torneo—the maritime district of Nordland, a portion of Norway, being situated between it and the North Sea. How much of the northern part of Sweden is entitled to be called Swedish Lapland, it is impossible to say. If the arctic circle be taken as the boundary line, only that portion of Sweden called North Bothnia can be considered as belonging to Lapland; but Pitea Lapmark and Umea Lapmark are sometimes mentioned as forming part of the latter country, and these are situated in West Bothnia. The cause of error may be traced to the circumstance of these nomadic tribes frequently inhabiting, at least for a portion of the year, districts of country far down in the interior of Sweden and Norway. Thus, in the latter country, the Rorars Mountains, situated between Christiania and Dronheim, are inhabited, during summer at least, by a family of Laplanders, with the never-failing herd of reindeer. But the exact boundary line is not very material, as it has reference only to different portions of a tract of country which is under one government.

There are numerous lakes and rivers in Lapland. Of the latter, several take their rise in the Koelin Mountains, and flow in various directions into the Atlantic Ocean or the Gulf of Bothnia. The principal rivers of the country are the Tana or Tarna, which takes a north-eastern course through Finmark, and empties itself into a bay or sound of the same name; the Alten or Alata, which is very rapid, forcing its way through the mountains of Finmark in a north-westerly direction, empties itself into a bay of the same name; the Torneo, which issues from a lake so named, and, after being enlarged by a number of streams uniting in one channel and running nearly due south through a long course, falls into the northern extremity of the Bothnian Gulf at Torneo; and the Muonio, which rises from the Killpis Jaure, at the foot of the alpine chain of Norway, is a considerable stream, and constitutes the boundary line between Sweden and Russia, till it unites with the River Torneo, when the latter marks the

limits of either country in this quarter. There are also other rivers which take their rise in Lapland, and fall into the Gulf of Bothnia, such as the Lulea, Pitea, Kalix, and others. In Russian Lapland there are several considerable streams, but these have not been so well defined, nor has this part of Lapland been so fully described as the others. The Kemi takes its rise among the Kemi Mountains, situated near the centre of the country, and flows into the Gulf of Bothnia. It has many imposing cataracts, of which the *Taival Koski*, or the fall of the heavens, is the only one which the adventurous boatmen never attempt to cross. The *Passa*, or holy stream, is the outlet of the great lake Enara, flowing thence to the Arctic Ocean. The eastern declivities of Russian Lapland are watered by the Panol, which discharges itself into the White Sea. The Tuloma falls from a great height, enters the Lake Kola, which name it afterward takes, and falls into Kola Bay, on the Arctic Ocean. Beside these, there are numerous other rivers which traverse the country in various directions, and either give rise to lakes, or issue from them.

Fishery.—The coast Laplanders support themselves entirely by the fishery; which is astonishingly productive, 2000 pounds' weight of cod-fish being caught in a day by means of lines alone. From the great number of small Russian vessels which frequent the coast at certain seasons, they find a ready sale for the fruits of their industry, receiving in exchange chiefly meal, brandy, tobacco, and the like. Whales are abundant, particularly what is called the fin whale, which is long, active, swimming with great strength and speed, and consequently difficult to capture.

Manufactures.—In their manual arts and manufactures, that is, making the various utensils which their mode of life requires, the Laps display some ingenuity. Their sledges and canoes are very strongly and closely put together, so as to be entirely impervious to water. They tan hides with the first inner bark of the birch, make strong cordage and thread of the sinews of the reindeer, weave coverings for their tents, knit gloves, fashion wooden utensils for domestic purposes; and the women prepare the skins of foxes, fawns, otters, and other animals for sale, by stripping off the membranaceous parts, and curing them with fish-oil.

Russian Lapland begins at the Waranger Fiord, under N. lat. 70, and extends as far as the White Sea. Admiral Litke, in surveying its northern coast, in the years 1822-3, has noted down many interesting particulars, from which we derive the following notes:

It may appear surprising, but it is nevertheless true, that this coast, navigated for three centuries by the first maritime nations, was, before Admiral Litke's survey, less known to us than many of the most distant and uninhabited parts of the globe. Vessels trading to Archangel had, for a long time, only the *Zeefakel* of the Dutch for a guide. Litke, June, 1822, began his survey of the Lapland coast at Cape Orlov, in about N. lat. 67°. This, the eastern extremity of Russian Lapland, consists of high, steep, and bare rocks. Near Sviatoi Nos (in N. lat. 68°) the coast has an inviting appearance; the south side of the islands, or indentations, being covered with beautiful turf, wild leek, and a number of strawberries, but there were no bushes. On the main shore, however, were seen low dwarf birch and juniper bushes, and numerous tracks of reindeer. During summer, as Admiral Litke was here informed, there is no land route through Lapland; and all who are then necessitated to travel—as, for example, clergymen, the judges, or officers of judicial courts, etc.—pass by *shnabes* along the shore, by stations, from Kola, round the whole peninsula, as far as Kandalaksha, in the extreme north-eastern point of the White Sea. Between Kandalaksha, however, and Kola, they manage to travel in the usual manner. A little to the west of Sviatoi Nos is the mouth of the Yukanka River, which is navigable

for three to four sea miles up, when rapids commence, and prevent navigation, even for small boats. On the left bank of this river lies a Lopar village, called the Yukanka Lodge: for all places of the Lopares, both for summer and winter residence, are called by the Russians *pagosti* (lodges).

About 30 miles north-west from Yukanka is Cherni Nos, or Black Cape; and near it, Noknev Island—in earlier charts, called Nagel, or Nagol. Here Admiral Litke found that the needle showed no variation. On the main shore, near Noknev Island, the principal fishes caught are salmon, bib, *paltus*, and *piksha*. The *peschanka* (sand-eel) is caught in a remarkable manner. Some time before ebb, the Lopares set about digging up the wet sand close above the strand line; with almost every step they dig out such a fish, to which, however, they must not allow a second's time, as otherwise it would be sure to dig itself in again, and escape. As soon as they perceive it, therefore, they seize it with a handful of sand, and throw it violently on the ground. The fish, thus stunned, are collected in baskets or casks. It is strange that this fish is found only at ebb during the day, and never at night. The people of this place had also some sheep, which had abundant food in the adjoining pastures.

The chief island on the coast of Russian Lapland is Kildin—not Kilduin, as the Dutch call it—and lies 11 miles east from the mouth of the Kola Bay. It is 9 miles long, and $1\frac{1}{2}$ to $3\frac{1}{2}$ miles broad. Its shores are high and precipitous on the north side, and terminate abruptly in a perpendicular rock on the west, while on the south-east side it slopes down gently to the sea. The appearance of the south coast is most peculiar, rising as it does in four most regular terraces, forming an amphitheatre of 500 feet in height, with a flat, table-like top. This coast is everywhere clothed with the richest verdure, forming a most striking contrast with the bare granite crags on the main shore. The island consists of primary slate, and thus differs from both the islands and the main shore to the south-eastward, which show only granite.

Kola, the capital of Russian Lapland, is situated at the confluence of the Rivers Kola and Tuloma, about 30 miles from the sea. As determined by Mr. Rasumowski, who, in the last century, observed in this place the transit of Venus over the sun, the latitude of the city is $68^{\circ} 52'$, the longitude $33^{\circ} 1'$ east from Greenwich. It appears that Kola was founded long before 1553, as English and other mariners traded already about the middle of the 16th century to Kola as to a well-known place. It was at first only a *wolash* (capital of a district), became under Peter the Great an *ostrog* (fortified place), and since the foundation of the stadtholdership, the capital of a government. The place extends 530 fathoms along the River Kola, and 175 fathoms along the River Tuloma. Except a church built of stone, all the houses are of wood. The streets are paved with planks. On the bank of the Kola, near the centre of the town, lies a wooden fort, being a square with five towers: since the rupture with England, in the year 1800, the cannon of this fort were removed to the priory of Solowez, in order to put the latter in a state of defense; and since then, the walls of the fort serve only as a fence for the cathedral, and the towers are transformed into storehouses. The number of inhabitants of both sexes was estimated by Litke, in 1822, at about 800, but recent official data show that it was, in 1849, only 642. The officials and merchants of Kola live in a style varying little from that of the capital. In external appearance, Kola is that of a clean town; and the houses, consisting frequently of two floors, are neat. The view of the town from the north-east is most charming; it stands on a high and abrupt bank, from which a wide plain extends, bordered on three sides by high hills. The principal trade of Kola is in fish, particularly in bib (*treshka*) and *paltus*. The Ko-

laers are not themselves engaged in fishing, but obtain the fish by barter, mostly from the Russian fishers trading on the Lapland coast, partly from the Norway ports of Wadsö, Wardhuus, Hammerfest, and even from Tromsö, to which ports the Kolaers are permitted to export about 2000 *tchetwert* of rye flour every year.

Kola *lodji* go to Archangel to barter their cargo of fish for the various merchandise they require, and some of them venture to set out from the latter place on their return home as late as October. While the men of Kola are thus occupied, their wives and daughters do not remain idle. They cross in little boats to the islands to gather *maroshka*, the berries of *Rubus chamamorus*. A boat contains usually but one young and able man, and from 12 to 20 women. Among the islands near the Bay of Kola, the Koreline Islands are considered to give the best produce of *maroshka*; they lie five miles west from the mouth of the bay. The Kola women, however, will go still further, to Motov Bay, and even to the Ainova Isles, at least 100 miles from Kola, in a boat. The *maroshka* from these isles are said to surpass in size and flavor all others, and are mostly destined for the imperial court. The Bay of Kola, near the town, is so shallow that even the smallest vessels can approach it only at high water. The River Kola ceases altogether to be navigable at the town; but the Tuloma is navigable for about 40 miles, namely, to its origin from the lake. Its banks are densely wooded with splendid fir. There is a small and bare island in the middle of the Bay of Kola, called Solnoi Ostrov (Tallow Island), from the immense number of seals which formerly used to come ashore here, but which entirely disappeared about the end of the last century.

The Lap hut is formed interiorly of wood, by means of curved ribs, which unite near the centre in a ring, which is open, and allows free escape for the smoke, the fire being lighted in the centre of the floor. The exterior is covered with turf. The door is wood on one side. The inmates recline on skins on the floor, with their feet toward the fire; and behind them, on a row of stones near the wall of the hut, are their various utensils. Their clothing—chiefly of tanned skins and woolen stuffs—looked very dirty. Their whole wealth consists in reindeer. The two families who frequent this valley possess about 700 deer. We saw, perhaps, about one fourth of that number. A few of them were driven, for our inspection, into a circular inclosure of wooden paling, where they are habitually milked. One of the men dexterously caught them by the horns with a *lasso*, or noose. The deer are small; but some of them carry immense branching horns, the weight of which they seem almost unable to support. At this season their long winter coat of hair came off by handfuls. They make a low grunting noise, almost like a pig. The milk is very small in quantity, and excessively rich.

The whole population of Finmark does not exceed 45,000. The degrading superstition in which they were formerly sunk has now in a great measure disappeared, along with those numerous deities which they worshipped: the wild creations of unenlightened nature have been superseded by Christianity, and a knowledge of the true God. Regular clergymen are established in the country by the different governments, and the Laps exhibit much reverence and devotional feeling during divine service, although its purport is only known to them through an interpreter. Finmark, in regard to ecclesiastical regulations, is under the jurisdiction of the Bishop of Norland and Finmark, both of which form one diocese. Swedish Lapland has a population of only about 12,000.—E. B.

La Plata. The Argentine Republic, or "La Confederacion Argentina," comprises the provinces which, with Paraguay and Uruguay, now independent States, constituted, under Spanish rule, the vice-royalty of Buenos Ayres. Its area is the largest of the South Amer-

ican republics, and its population to the square mile the smallest. It consists of 13 provinces, comprising an area estimated at 786,000 square miles, and contains a population of about 764,000 souls. Other estimates reduce this number to 596,000, while the "Almanach de Gotha" for 1855 gives a total number of about 2,000,000, of whom 1,200,000 are creoles, Spaniards, and mestizos, 200,000 subjugated Indians, and 25,000 negroes. Within a few years, Buenos Ayres has withdrawn from the confederacy. With the exception of a portion of the extensive plains, called *pampas*, watered by the rivers Rio Negro, Colorado, and Desaguadero, nearly all the country belongs to the basin of the La Plata, the great estuary of which is between the State of Buenos Ayres and the Uruguayan port of Montevideo. The most important product of the republic is cattle. Immense droves of oxen roam at large over the *pampas*, and vast herds are scattered throughout the extensive breeding estates of private individuals. Horses and mules constitute a prominent article of commerce with the Peruvian and other traders; and sheep and hogs, and the small quadrupeds which furnish the nutria and chinchilla-skins, are among the valuable native animals. Cotton, tobacco, rice, cocoa, sugar-cane, indigo, maize, wheat, and other grains, constitute leading productions; but the staples of export are hides, skins, horns, bones, horse-hair, wool, tallow, ostrich feathers, salted meats, crude saltpetre, and cocoa. The export trade reaches, annually, a value of about \$10,000,000.

Commercial relations between the United States and the Argentine Republic are regulated by treaties of July 10th and 27th, 1853. The former treaty relates chiefly to the navigation of the rivers Parana and Uruguay: that of July 27th was designed to acknowledge and confirm the relations subsisting between the two governments by the signing of a treaty of friendship, commerce, and navigation, as well for the good security as for the encouragement of the commercial intercourse already subsisting between them. This latter treaty stipulates that perpetual amity shall exist between the two countries and their respective citizens; that there shall be reciprocal freedom of commerce; that the citizens, ships, etc., of each shall be protected in the territories of the other, to which other foreigners, or the ships or cargoes of any other foreign nation or state are or may be, permitted to come; that the respective ships of war, and post-office or passenger packets of the two countries shall have liberty freely and securely to come to all harbors, rivers, and places to which other foreign ships of war and packets are, or may be, permitted to come; to enter into the same; to anchor and remain there, and refit, subject always to the laws and usages of the two countries respectively; that any favor, exemption, privilege, or immunity whatever, in matters of commerce or navigation, which either of the two nations has actually granted, or may hereafter grant, to the citizens or subjects of any other government, nation, or state, shall extend, in like cases and circumstances, to the citizens of the other; that no high or discriminating duties shall be imposed, in the territories of either of the contracting parties, on any article of the growth, produce, or manufacture of the territories of the other, than are, or shall be, payable on the like article of any other foreign country; that export duties on all articles exported from the territories of either party to those of the other, shall be the same as when the exportation is made to any other foreign country; and that all prohibitions as to imports and exports, into or from either country, shall be such as extend to the like articles of any other foreign country. The treaty further provides that no other or higher duties or charges, on account of tonnage, light or harbor dues, pilotage, salvage in case of average or shipwreck, or any other local charges, shall be imposed in the ports of either of the two contracting parties, on the vessels of the

other, than those payable in the same ports on its own vessels; that the vessels of each shall enjoy entire equality with national vessels in the ports of the other, both as respects imports and exports; that a regular passport, or sea-letter, furnished by competent authority, shall be sufficient evidence of the nationality of the vessel; that the merchants, commanders of ships, and all other citizens of either of the contracting parties, shall enjoy, in the management of their affairs in the territories of the other, the same privileges and rights, in all respects, that belong to its own citizens under the laws and established customs of the country; that, in case of the death, without will or testament, of any citizen of either of the contracting parties, in the territories of the other, the consul-general or consul of the nation to which the deceased belonged, or the representative of such consul-general or consul in his absence, shall have the right to intervene in the possession, administration, and judicial liquidation of the estate of the deceased, conformably with the laws of the country, for the benefit of creditors and legal heirs. The treaty concludes with placing the diplomatic agents and consuls of the United States on the same footing as similar representatives of the most favored nation, and makes ample provision respecting religious privileges, rites of burial, etc. This treaty contains no limitation as to its duration, but provides that the amity which it establishes between the citizens of the two republics shall be perpetual. The foreign trade of the Argentine Republic was formerly monopolized by Buenos Ayres; but, in 1852, new channels of commerce were opened, the Parana and Uruguay Rivers being declared free to the commercial traffic and navigation of all nations by a decree officially promulgated October 30, of which a translation is subjoined:

Article 1. The navigation of the Rivers Parana and Uruguay is allowed to every description of merchant vessels, whatever may be their nation, place of departure, or tonnage. Art. 2. All merchant vessels may enter the ports established on the Rivers Parana and Uruguay. Art. 3. The established ports are: 1. In the province of Entre Rios, that of the city of Parana, the capital of said province, and those of Diamanti, Victori, Gualaguai, and La Paz, on the River Parana; and those of Gualaguachu, Concepcion del Uruguay, Concordia, and Federacion, on the River Uruguay. 2. In the province of Santa Fé, that of the capital of the province and that of Rosario. 3. In Corrientes, the capital of the same, Bella Vista, and Gorga. Art. 4. All those ports designated in the foregoing article shall have custom-houses for foreign trade; and those established in the provinces of Jujui, Salta, San Juan, and Mendoza shall have custom-houses for inland trade. Art. 5. Until the national tariffs be fully arranged, the custom-houses for foreign trade on the river shall continue to collect duties, according to existing regulations. Art. 6. Seven per cent. upon the valuation of the articles imported for consumption into the litoral provinces shall be collected as the sole national tax. Art. 7. In the custom-houses for inland trade, six per cent. upon the valuation shall be collected on all articles introduced, as a national tax. Art. 8. All the custom-houses for foreign trade, as well on the rivers as in the interior, shall permit the transit of foreign merchandise for the provinces of the confederation; but the custom-house dispatching them shall collect and retain five per cent. upon the valuation of the goods, as the whole of the national tax. Art. 9. All goods and merchandise of foreign production, or shipped from foreign places, and all the productions of the manufactures or industry of Buenos Ayres, which are introduced by land into any of the provinces of the interior, shall pay, for the present, the same duties as are collected in the custom-house of Rosario. Art. 10. In the same custom-house, the same duties on exporta-

tion as on importation shall be paid on whatever articles interior provinces may introduce into the province of Buenos Ayres. Art. 11. In all the custom-houses in which deposit is allowed, the same shall be continued subject to the existing regulations. Art. 12. Within the territories of the 13 confederated provinces, the passage of their own product or manufacture shall be free of all duties of transit or on consumption. Art. 13. The present decree shall have effect only until the national congress shall establish permanent regulations on the subject it embraces.

The above decree, published by the provisional director of the republic, was followed by the publication, on the 18th of the same month, of the following resolution of the representatives of the province of Buenos Ayres:—"The province of Buenos Ayres, recognizing as a principle of general convenience the opening of the River Parana to the traffic and navigation of all nations, from this present date declares and authorizes the same on its part."

Buenos Ayres must always be a point of great commercial importance, as it is the principal outlet through which the produce and industry of the immense regions lying behind can have an egress to a foreign market; and it is only through this port and Montevideo that those countries can receive, by the La Plata and its tributaries, unless in the direct trade, their supplies of foreign merchandise. Indeed, these two ports form the only channels through which the productions of the countries lying between the Cordilleras and the La Plata will find their way to foreign markets. By late advices to the State Department, notice is received of a law which passed both houses of the Argentine legislature, and was approved by the President July 19, 1856, establishing differential duties on all foreign merchandise introduced into the ports of the confederation, in the indirect trade from Buenos Ayres. These duties are almost equivalent to prohibition, and will divert from the port of Buenos Ayres that portion of the foreign trade destined for the fluvial provinces. The chief reason assigned for the adoption of this measure, as announced during the debate which it elicited in both branches of the legislature, was, that it would be the most effective means that could be adopted to force Buenos Ayres from its secession movements, and thus restore tranquillity to the republic. Already the government budget of Buenos Ayres shows a deficiency of \$9,000,000. This act of the confederation, in driving from its ports the foreign trade of the other provinces—hitherto a source of immense profit to its treasury—may lead to a commercial, perhaps a political, crisis.

The navigation of the La Plata and its tributaries is represented to be at this time active, employing a heavy tonnage both of steamers and sailing vessels. The trade between Buenos Ayres and Montevideo consists in the transhipment, to and from either port, of articles the growth or manufacture of Europe and the United States, and the conveyance of passengers. From Buenos Ayres to the interior, the trade consists in the interchange of foreign merchandise for the various productions of the La Plata provinces. South of Buenos Ayres, and from Patagonia, in exchange for dry goods, spirits, wines, and sundries, are imported hides, skins, tallow, hair, and, occasionally, wheat and salt, especially from Patagonia. The principal ports in the provinces open to this trade are San Fernando, San Pedro, and San Nicolas, in the province of Buenos Ayres; Rosario and Santa Fé, in Santa Fé; Gualaguachu, Parana, and Concordia, in Entre Rios; Gorga, Bella Vista, and Corrientes, in the province of Corrientes. From all these ports, as from those in Paraguay and Uruguay, the imports consist chiefly of yerba maté (Paraguay tea), and tobacco, hides, lumber, nutria, wool, candles, soap, ashes, peanuts, and various manufactures of wood.

The steam-vessels, exclusive of those of the British

Royal Mail Steam-packet Company, regularly employed, at a late date, in the navigation of the Plata, are: five steamers, under the Oriental flag—one of them constructed in the United States—and one under the Buenos Ayres flag, also of United States' origin. According to the navigation returns of the Argentine Republic for 1852, the steamers engaged in the regular trade between Buenos Ayres and Montevideo, with the

number of round trips made by each, were as follows: 1 American, 44 round trips; 1 British, 17; 2 Oriental, 38; and 2 Brazilian, 14. The sailing-vessels engaged in the same trade, were 2 schooners, under the Oriental flag, which made 42 round trips; and 2 schooners and 2 brigantines, under the flag of Buenos Ayres, which made 40 round trips. The following table shows the exports of Buenos Ayres for six years, ending 1854.

1835	213	51	1854	334	28

The aggregate value of cargoes from the United States imported into the port of Buenos Ayres during the year 1851, was \$600,181; 1852, \$659,915; 1853, \$497,836. The aggregate value of exports from the port of Buenos Ayres to all countries in 1854, is stated by French authorities, as follows:

	Francs.		Francs.
Great Britain.....	10,060,558	Hanover.....	204,382
United States.....	9,163,799	Holland.....	1,329,547
Spain.....	11,255,839	Portugal.....	125,599
Hanse Towns.....	5,186,907	Argentine Repub.	366,061
France.....	5,356,352	Uruguay.....	212,038
Sardinia.....	8,796,605	Prussia.....	49,853
Brazil.....	1,785,272	Two Sicilies.....	30,738
Belgium.....	883,183		
Denmark.....	947,340	Total francs....	51,287,072
Sweden.....	927,604		
Norway.....	95,450	Total dollars... \$	9,744,543

From statements published by the minister of finance of the State of Buenos Ayres to the legislative chambers, on the revenues of the customs, it appears that there was imported in 1854, of merchandise of every description, in value, as follows:

	Paper piastres.
Sundry articles, paying 5 per cent. duty.....	16,677,540
Sundry articles, paying 10 per cent. duty.....	1,437,987
Silks, paying 12 per cent. duty.....	5,811,241
Sundry articles, paying 15 per cent. duty.....	134,494,533
Articles made up, and provisions, paying 20 per cent. duty.....	44,800,830
Liquors, paying 25 per cent. duty.....	39,424,824
Articles free of duty, or entered in contraband....	57,358,245
Total.....	300,000,000
Value in U. S. currency.....	\$15,000,000
Total exports of Buenos Ayres in 1854.....	\$9,744,543
Total imports of Buenos Ayres in 1854.....	15,000,000

The large balance of trade, however, which appears against this port (as is the case also with the port of Montevideo), is accounted for by the fact that the wants of the interior provinces of Paraguay, and even of many places in Bolivia, are supplied from these two points.

Wool constitutes upward of 25 per cent. in value of all the imports into the United States from the Argentine Republic. This is shown by the following tabular statement made up from annual reports of the Treasury Department on commerce and navigation for the years named, exhibiting the total values of imports into the United States from the Argentine Republic, from 1851 to 1855, together with the values of wool imported from the same country during the same period:

Years.	Total values of imports.	Values of wool.
1851.....	\$3,265,833	\$1,323,337
1852.....	2,091,097	704,064
1853.....	2,186,641	538,653
1854.....	2,144,971	854,232
1855.....	2,545,037	627,718

Of the total quantity of wool imported into the United States from all countries, about one third, or nearly so, is received from the Argentine Republic. This is shown by the following tabular statement, derived from the same sources as the former, exhibiting the quantities of wool imported into the United States from all countries, from 1851 to 1855, together with

the quantities imported from the Argentine Republic during the same period:

Years.	All countries.	Argentine Republic.
1851.....	32,543,491	12,106,636
1852.....	18,841,298	7,084,742
1853.....	21,595,079	5,745,857
1854.....	20,200,110	6,255,698
1855.....	18,534,415	5,966,969

The preceding table exhibits an aggregate of 111,-219,393 pounds of wool imported from all countries, and of 37,159,802 pounds from the Argentine Republic, or an annual average of 22,243,878 of the former, and of 7,431,960 of the latter; being a fraction over one third of the whole.

Regulations of the Port of Buenos Ayres.—Article 1.

—All vessels at anchor in the port, whether national or foreign, shall render every assistance in case of a vessel breaking adrift, or of any other accident; or, in default, shall suffer the penalties established by law, and in proportion to the gravity of the case. 2. All vessels at anchor in the roads must have their anchors buoyed, on account of the shallow water; or pay all damages which may occur to any vessel or boat, from this precaution having been neglected. 3. Any vessel losing a buoy from her anchors shall report it immediately to the captain of the port, who will send off a pilot to replace it. No anchor can be weighed without permission of the captain of the port. 4. Pilots on bringing vessels up in the roads are to inform the captain what articles are necessary for their perfect safety, and in case of there being any wanting, report it to the captain of the port. Pilots neglecting to do so will be punished with the rigor of the law. 5. If, in a gale, the anchor of any vessel should happen to drag, or the cable part, either on account of said cable not corresponding with the size of the vessel or the anchor, or from rottenness, said vessel will be responsible for all the damages occasioned thereby. 6. Any vessel from sea, that may anchor in this port without applying to a pilot, will be liable to pay all damages that may occur, and can not claim redress if she, in any way, sustains damage. 7. Any vessel at anchor with her boats astern, and not hauling them alongside upon seeing another under sail, so as to give a free passage, can not claim for the damages she may suffer, and shall be obliged to pay for those occasioned. 8. No vessel at anchor in the roads can heave ballast, or any thing that does not float, overboard; and if such be proved to have been done, the act will be punished according to law. 9. No vessel, excepting on her arrival, can salute in the inner roads without obtaining permission of the captain of the port. Those which do so will suffer the penalties the government may determine on. 10. All boats, belonging to merchant vessels at anchor in either roads, shall put off from shore one hour after sunset. 11. All boats that may be found on the beach, from the time of firing the evening gun until daybreak, will be seized, and the crew punished according to the gravity of the case.

PILOT DUES OF THE PORT OF BUENOS AYRES.

Vessels drawing	Silver dollars.	Vessels drawing	Silver dollars.
10 feet, pay.....	40	17 feet pay.....	150
11 ".....	50	19 ".....	210
13 ".....	70	20 ".....	240
14 ".....	90	21 ".....	260
15 ".....	110		

All vessels, excepting packets, requiring a pilot to enter the inner roads, pay \$200 currency (equal to \$10 United States' coin—the currency dollar being, at present, equal to 5 cents, United States). When leaving port, whether taking a pilot or not, they pay \$200 currency (\$10 United States). Any vessel that may enter the inner roads without a pilot, wishing to be moored or to change anchorage, pays \$100 currency (\$5 United States).

Port Charges.—Tonnage dues per ton, entering (currency), $\$1\frac{1}{2}$ = \$0 07½ cents, United States; visit and regulation, \$7 = \$0 35; stamps for opening register,

etc., \$169 = \$8 45. Tonnage dues, clearing, \$1½ = \$0 7½; crew list, \$12 = \$0 60; bill of health, \$6 = \$0 30.

By the following law, passed by the Senate and Chamber of Representatives of Buenos Ayres, and officially announced under date of September 6, 1854, it will be seen that vessels of friendly nations enjoy the same privileges, and are subject to the same restrictions, as national vessels:—"From the date of the present law, there will not be charged in the

ports of the State of Buenos Ayres, to the vessels, of friendly nations of more than 120 tons, for tonnage dues, port dues, pilotage, salvage in case of damage or shipwreck, more than will be charged to Argentine vessels."

This law places the vessels of the United States on an equality with those of Buenos Ayres; while, under an old law, the ship's register is taken as evidence of her measurement. For a more extended account of the commerce of La Plata, see article BUENOS AYRES.

COMPARATIVE STATEMENT OF THE COMMERCE OF THE UNITED STATES WITH THE ARGENTINE REPUBLIC, EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH COUNTRY, DURING THE YEARS DESIGNATED.

By a recent treaty with Brazil, the free navigation of the Parana and Paraguay is secured. The tariff of import duties adopted by the Argentine Republic is based on the per cent. ad valorem principle, breadstuffs excepted; while export duties are chiefly specific.—*Com. Relations, U. S.*

Larboard, among seamen, the left hand side of the ship when you stand with your face toward the head.

Larch. In the catalogue of soft timber used in ship-building, the *larch* or *hacmatack* is not the least useful—the latter name is the aboriginal. It sometimes attains an altitude of 70 feet, but is usually found from 40 to 50 feet. It is generally of straight growth, but quite tapering. It grows rapidly, and is of great strength; and its durability exceeds that of the oak. It is distinguished for the closeness of its grain, is very compact, and of reddish color; and for knees and top-timbers of vessels, particularly steam-vessels, is unequalled. This fact should, however, be retained, that its strength is quite out of proportion to its density; hence, we say, that it should always be fastened with square iron; under such circumstances it is superior to oak. This timber is extensively cultivated in Europe, and is not a rare specimen of vegetation in the New England States.—*GRIFFITH'S Ship-builders' Manual, N. Y., 1856.*

Lascars, native Indian sailors, many of whom are in the service of the East India Company.

Last, an uncertain quantity, varying in different countries, and with respect to different articles. Generally, however, a last is estimated at 4000 pounds; but there are great discrepancies.

The following quantities of different articles make a last, viz.:—14 barrels of pitch, tar, or ashes; 12 dozen of hides or skins; 12 barrels of codfish, potash, or meal; 20 cades, each of 1000 herrings, every 1000, 10 hundred, and every 100 five score; 10½ quarters of cole-seed; 10 quarters of coan or rape-seed. In some parts of England, 21 quarters of corn go to a last; 12 sacks of wool; 20 dickers (every dicker 12 skins) of leather; 18 barrels of unpacked herrings; 10,000 pilchards; 24 barrels (each barrel containing 100 lbs.) of gunpowder; 1700 lbs. of feathers or flax. *Last* is sometimes used to signify the burden of a ship.

Lateen Sail, a long triangular sail, extended by a lateen yard, and frequently used in *Xebecs, Polacres, Setaes*, and other vessels which navigate in the Mediterranean Sea.

Lath, Laths (Fr. *Lattes*; Ger. *Latten*; It. *Correnti*; Rus. *Slegû*), long, thin, and narrow slips of

wood, nailed to the rafters of a roof or ceiling in order to sustain the covering. Laths are distinguished into various sorts, according to the different kinds of wood of which they are made, and the different purposes to which they are to be applied. They are also distinguished, according to their length, into five, four, and three feet laths. Their ordinary breadth is about an inch, and their thickness a quarter of an inch. Laths are sold by the bundle, which is generally called a hundred; but seven score, or 140, are computed in the hundred for three feet laths; six score, or 120, in such as are four feet; and for those which are denominated five feet the common hundred, or five score.

Latitude. First determined by Hipparchus of Nice, about 170 B. C. It is the extent of the earth or of the heavens, reckoned from the equator to either pole. Maupertuis, in latitude 66°20' measured 1° of latitude, and made it 69°49'; he measured it in 1737. Swanberg, in 1603, made it 69°29'. At the equator, in 1744, four astronomers made it 68°73'; and Lampton, in latitude 12°, made it 68°743'. Mudge, in England, made it 69°148'. Cassini, in France, in 1718 and 1740, made it 69°12', and Biot 68°769'; while a recent measurer in Spain makes it but 68°63', less than at the equator; and contradicts all the others, proving the earth to be a prolate spheroid, which was the opinion of Cassini, Euler, and others, while it has more generally been regarded as an oblate spheroid. See **LONGITUDE**.

Latten, a name sometimes given to tin plates; that is, to thin plates of iron, tinned over. See **TIN**.

Launch, in sea language, signifies to put out; as, launch the ship; that is, put her out of dock. Launch aft or forward, speaking of things that are stowed in the hold, is, put them more forward. Launch, ho! is a term used when a yard is hoisted high enough, and signifies, hoist no more.

Laurel-tree. The *Kalmia latifolia*, or laurel, is a large evergreen shrub or low tree, growing to a height of 15 or 20 feet, in favorable situations, with a stem three or four inches in diameter; but ordinarily it does not attain more than one half of these dimensions. Its leaves are of a coriaceous texture, oval-acute, entire, and about three inches long. The flowers, which put forth from May to July, are sometimes of a pure white, tinted with pale pink, delicately spotted; but, in general, they are a beautiful rose-color, and are destitute of odor. They are disposed in corymbs at the extremity of the branches; and, as they are always numerous, their brilliant effect is heightened by the richness of the surrounding foliage.

The seeds are very minute, and are contained in small, globular capsules.

The *Kalmia latifolia* is indigenous to North America, from Canada to Carolina. It rarely occurs, however, north of the 42d or 43d degrees of north latitude, and is but sparingly produced in Kentucky and western Tennessee, and disappears entirely in the southern States wherever the rivers enter the low country, or where the pine-barrens begin. Although it is comparatively abundant along the rivers of the middle and southern States, it is nowhere seen more profusely multiplied, nor of a greater height, and of more luxuriant vegetation, than in North Carolina, on the loftiest parts of the Alleghanies. It there occupies large tracts, and forms thickets upon their summits, and for a third of their distance down their sides, which are rendered almost impenetrable by the crooked and unyielding trunks, crossed and locked with each other. As the shrubs which compose these copses are nearly of the same height, and richly laden with evergreen foliage, they present, at a distance, the appearance of verdant meadows, surrounded by tall trees.

The wood of the *Kalmia latifolia*, particularly that of the roots, is very compact, fine-grained, and marked with red lines. When green, it is of a soft texture, and is easily wrought; but, when well seasoned, it is very hard, and more nearly resembles the European box (*Buxus sempervirens*), than any other American wood. Consequently it is worthy of the attention of mathematical instrument-makers, and of engravers on wood. It is sometimes employed in the United States for the handles of light tools, for screws, boxes, etc.; and it is said, also, to make good clarionets. It is used by the American Indians for making small dishes, spoons, and other domestic utensils. The whole plant is regarded as poisonous to young cattle, and sheep, but not to goats and deer. A decoction of the leaves of this tree was formerly taken by those miserable natives who had determined on self-destruction. But modern enterprise has successfully enlisted it in the service of medicine, and it is applied, in a pulverized form, internally, in fevers, or topically, for the relief of cutaneous affections. A few drops of the tincture poured upon the body of a large and vigorous rattlesnake, killed the reptile in a short time. The powder which covers the leaves is popularly employed in some parts of the country where it grows, for snuff. The honey collected from the flowers by bees, is accounted deleterious, which, with other noxious qualities of this elegant shrub, lessens that esteem which its beauty claims.

The *Laurus nobilis* is a native of the south of Europe, and northern Africa; and, according to St. Pierre, remarkably fine trees of it were found on the banks of the river Peneus, in Thessaly, which, probably, might have given rise to the fable of the nymph Daphne (supposing the Greek *daphnē* to be this tree), the daughter of that river. The exact date of the introduction of this species into Britain is unknown, but it must have been previous to 1562, as it is mentioned by Turner, in his "Herbal," published in that year; and we find that, in the reign of Elizabeth, the floors of the houses of distinguished persons were strewn with its leaves. The largest recorded tree of this species in Britain, is at Margram, in Glamorganshire, at the seat of C. P. Talbot, M. P., about 12 miles from Swansea. It is upward of 60 feet in height, with a magnificent bell-shaped summit, about 60 feet in diameter. At Cypress Grove, near Dublin, in Ireland, there is a laurel 50 feet in height, with a trunk two feet in diameter, and an ambitus or spread of branches of 25 feet. Throughout Germany, the *Laurus nobilis* is a greenhouse plant. In Russia, in the Crimea, it requires protection during winter. In Italy and Spain it attains a larger size than in any other part of Europe, forming immense bushes, from 50 to 70 feet in height. In the northern parts of the United States it is only

cultivated as a greenhouse plant; but in the southern sections of the Union, where the climate is more mild, it grows in great perfection in the open air. The wood of this tree, from its inferior size, is not much used in construction, nor in the arts. The young branches are sometimes employed for the hoops of small casks. Both the leaves and berries were formerly considered medicinal, being highly aromatic and stomachic; they are also astringent and carminative. An infusion of them was not only considered beneficial, when taken internally, but it was used in fomentations, etc. From the berries there is extracted a particular principle, called *laurine*. The kernels of the fruit yield an emollient and resolutive oil, called *oil of laurel*, which is employed as an embrocation in materia medica, and in the veterinary art. The essential oil is used in perfumery, and for scrubbing wainscots in chambers, in order to drive away flies. The leaves impart a yellow color to wool. The principal use of this tree, however, is for hedges, and other purposes of ornament, though the leaves are much employed for flavoring custards, blanc-mange, etc. The flowers afford the best kind of honey, and are numerously frequented by bees.

The *Laurus carolinensis* is indigenous to the lower part of Virginia, and is found more or less abundantly throughout the maritime districts of the Carolinas, Georgia, Florida, and of Louisiana. It occurs in the broad swamps which intersect the pine-barrens, and is there associated with the tupelo (*Nyssa biflora*), red maple (*Acer rubrum*), and the water oak (*Quercus aquatica*). A cool and humid soil appears to be essential to its growth; and it is remarked, that the further south it grows, the more vigorous and beautiful is its vegetation. The wood of the *Laurus carolinensis* is very strong, and of a beautiful rose-color, with a fine, compact grain, and is susceptible of a brilliant polish, having the appearance of watered satin. Before mahogany became in general use in cabinet-making, in the United States, the wood of this tree was much employed in the regions where it abounds, in the manufacture of articles of furniture of the highest degree of beauty. It might also be employed in ship-building, and for other purposes of construction, as it unites the properties of strength and durability; but its trunks are rarely found, of late, of sufficient dimensions to render it available for these purposes. When bruised, the leaves diffuse a strong odor, resembling that of the sweet bay (*Laurus nobilis*), and may, like them, be employed in cookery.—*Browne's Trees of America*.

Law, John. Law's Bubble was the most ruinous speculation of modern times. The projector, John Law, of Edinburgh, raised himself to the dignity of comptroller-general of the finances of Europe, upon the strength of a scheme for establishing a bank, an East India and a Mississippi Company, by the profits of which the national debt of France was to be paid off. He first offered his plan to Victor Amadeus, King of Sardinia, who told him he was not powerful enough to ruin himself. The French ministry accepted of it in 1710; and in 1716 he opened a bank in his own name, under the protection of the Duke of Orleans, regent of France; and most of the people of property of every rank in that kingdom, seduced by the prospects of immense gains, subscribed both in the bank and the companies. In 1718, Law's was declared a royal bank, and the shares rose to upward of twenty-fold the original value, so that in 1719 they were worth more than 80 times the amount of all the current specie in France. But the following year this great fabric of false credit fell to the ground, and almost overthrew the French government, ruining tens of thousand of families. It is remarkable that the same desperate game was played by the South Sea directors in England in the same fatal year, 1720.—*Hist. of France, Nouv. Dict.*

Law was the eldest son of William Law, and was

born at Edinburg in the month of April, 1671. His father followed the profession of goldsmith or banker, with so much success, that he was enabled to purchase the lands of Lauriston and Randleston, which afterward descended to his son. The latter was educated at Edinburg, where he is said to have made some progress in literature; but the bent of his genius having led him to study arithmetic and geometry, he attained such proficiency in these branches as to be able to solve with facility the most intricate problems; and he likewise made himself master of algebra. Law resided for several years abroad; first at Paris where he acquired great dexterity in all games of chance, and afterward at Genoa and Venice. One cause assigned for his leaving Paris, was his eloping with Lady Catharine, third daughter of Nicholas, Lord Banbury, and wife of Mr. Senor, or Semour. His success in play was so great, that he is said to have acquired £20,000. The favorite maxim inculcated by Law, and upon which his whole fabric of the Mississippi system was reared; namely, that the power and prosperity of a nation increase in proportion to the quantity of money circulating therein, and that, as the richest nations have not specie sufficient to afford full employment to their inhabitants, this defect may be supplied by paper credit; involves a dangerous fallacy, even in the most restricted view that can be taken of its application, inasmuch as it implies that paper money may be issued with advantage to an almost unlimited extent, upon general security; and that its credit, or, in other words, its value, may thus be maintained without its being rendered convertible at pleasure into cash. But all experience has proved that this is absolutely impossible. There is much truth in an observation of Mr. Burke, in his *Reflections on the French Revolution*. "It is not true," says he, "that Law built solely on a speculation concerning the Mississippi; he added the East India trade, he added the African trade, he added the farms of all the farmed revenue of France; all these unquestionably could not support the structure which the public enthusiasm, not he, chose to build on these bases. He laid the best foundation that he could, perhaps the best which, in the circumstances, it was possible to lay; but the nation went suddenly mad, an event which he could scarcely have foreseen; the Company was hurried onward by the general frenzy; and when the delirium had reached its height, the regent was advised to issue the fatal edict, which leveled the whole fabric to the dust." (See E. B., 1856.) *Œuvres de Law*, passim; *Histoire du Système des Finances*, tom. i.; Pollnitz, *Mémoires*; Massillon, *Mémoires de la Minorité de Louis XV.*; *Mémoires de la Régence de M. le Duc d'Orléans*, tom. i.; Richelieu, *Mémoires*, tom. iii.; Voltaire, *Siècle de Louis XV.*; Chalmers's *Biog. Dict.*, art. "Law."

Lawn (Ger. and Fr. *Linon*; It. *Linone*, *Rensa*; Sp. *Cambray clarin*), a sort of clear or open-worked cambric, which, till of late years, was exclusively manufactured in France and Flanders. At present, the lawn manufacture is established in Scotland and in the north of Ireland, where articles of this kind are brought to such a degree of perfection as nearly to rival the productions of the French and Flemish manufactories. In the manufacture of lawns, finer flaxen thread is used than in that of cambric.

Lawrence, a manufacturing town of the United States of North America, Essex county, Massachusetts, is situated on the left bank of the Merrimac, 26 miles north of Boston, and forms the centre of a network of railroads communicating with Lowell, Newburyport, Boston, and other places of importance. Although founded but recently, Lawrence has become one of the chief manufacturing towns in New England, in consequence of the great water-power it derives from the Merrimac. In 1845, the Essex Commercial Company constructed a dam of masonry across the stream, by which a

fall of 28 feet was obtained for the whole river. From this dam a canal, from 60 to 100 feet broad, 12 feet deep, and more than a mile long, conducts the water to the various factories situate between it and the Merrimac. The town proper, which is laid out between the latter and a small tributary called the Spicket, has in its centre an open common of 17½ acres in extent, and contains a town-house, jail, several churches and schools, and a literary institute. The inhabitants are almost all employed in the various factories in the town, some of which are of great size, and one, the Pacific, is said to be the largest in the world. The building has seven stories, and its flooring covers 16 acres, while the consumption of cotton within its walls amounts to 1,500,000 lbs. yearly, and of wool to the third of that amount. It gives employment to about 2000 persons. The manufactures of the town comprise woolen, linen, and cotton goods of various kinds. Incorporated 1847. Population in 1848, 6000; in 1850, 8283; in 1855, about 14,000.

Lawrence, St., an important river of North America, forming part of the north boundary of the United States, and watering the finest portion of British America, rises, under the name of the St. Louis, in lat. 47° 45' N., long. 93° W., flows east, and enters the south-west extremity of Lake Superior. Passing through the chain of great lakes, it quits Lake Ontario at Kingston. Here it takes the name of the Iroquois, and flowing north-east forms the wide expanses called Lakes St. Francis, St. Louis, and St. Peter. It is first called St. Lawrence after passing Montreal. Below Quebec it forms a broad estuary; and it enters the Gulf of St. Lawrence at Gaspé Point by a mouth 100 miles wide. Length, from Lake Ontario to the Gulf, 650 miles; entire length, 1800 miles. The basin of the St. Lawrence is estimated to contain 297,000 square miles, of which 94,000 are covered with the waters of the great lakes. The river receives many important tributaries from the north, but none of any size from the south. The tides rise to the district of Three Rivers. Ships of the line ascend to Quebec, and vessels of 600 tons to Montreal. The navigation is continued hence by canals to Kingston and Lake Ontario. See CANADA LAKES, COMMERCE OF.

Lawrence, St. Gulf, an inlet of the Atlantic Ocean, British North America, having Newfoundland on the east, Labrador, Lower Canada, and New Brunswick on the north and west, and Nova Scotia and Cape Breton on the south; extending from N. lat. 46° to 51° 30', and W. long. 58° to 65°. It communicates with the ocean by three channels, the principal of which is between Cape Breton and Newfoundland, 48 miles in width at its narrowest part. The other two channels are much narrower; the Straits of Belle Isle, between the north extremity of Newfoundland and Labrador, being 10 miles, and the Gut of Canso, betwixt Cape Breton and the main land, being only about half a mile in width at the narrowest part. The Gulf is about 300 miles in length, from north to south, by 240 miles in breadth, and incloses numerous islands, the chief of which are—Anticosti, in the north, the Magdalen group in the centre, and Prince Edward's Island in the south. The estuary of the St. Lawrence River debouches into the Gulf at the western extremity of Anticosti; although, properly speaking, this firth is an inlet of the Gulf as far up as the River Saguenay. Navigation is suspended here during winter and early spring, from the prevalence of ice, which is especially dangerous in the entrance to the Gulf. Fogs also are very frequent during the prevalence of the east winds in spring. In summer, however, the west and south-west winds render navigation comparatively safe. The fisheries, which are very valuable, are prosecuted with assiduity by the colonies as well as by United States' companies. Herring, cod, and mackerel abound. See CANADA and LAKES.

Laws of Commerce. The following article contains a condensed summary of the present state of commercial law in those countries with which the United States have commercial intercourse. For this valuable sketch, we are indebted to "*The Commercial Laws of the World*," by LEONE LEVI, London, 1854, 2 vols., 4to.

1. *Anhalt-Bernbourg, Anhalt-Coethen, Anhalt-Dessau, Duchies of.*—The Duchies of Anhalt-Bernbourg, Anhalt-Coethen, and Anhalt-Dessau, each forming an independent State, are under laws peculiar to themselves. One may easily perceive, however, that in provinces of so limited extent, and where commercial relations are very partially developed, legislation must have remained imperfect. Thus, in their tribunals, they have to refer either to laws which are rather civil than commercial, to foreign legislation, or to the common law of Germany. Two ordinances of 31st August, 1802 and 1832, on bills of exchange, were replaced by the law recently enacted for all Germany. There exists in the Duchy of Anhalt-Dessau an ordinance in regard to brokers, of the 19th April, 1803, and a law relating to bankruptcy, of the 12th July, 1818; but these contain only a small number of unimportant arrangements, which it is unnecessary to specify; with only one exception, namely, that in the law regarding brokers, every contract concluded by such persons is null if not drawn up in writing, and is complete only when the deed has appended to it the signatures of the parties interested. There is no special jurisdiction in the three Duchies for the determination of commercial suits. They are decided by the ordinary tribunals. It would be difficult to enter into the detail of the organization of these courts, the powers of which are of a very complicated character, and whose competency varies according to the persons or matters brought before them. It is sufficient to remark that the princes of the three Duchies of Anhalt joined with the princes of Schwartzburg in establishing, 14th October, 1807, a supreme court of appeal, before which all affairs, civil and criminal, of their respective States, are, or may be, finally carried.

2. *Austrian Empire.*—The commercial legislation of Austria, at present in force, is traced to the time of Maria Theresa, who, in 1756, published an ordinance of considerable length on matters connected with commerce. She at the same time caused a revision of the former law of exchange of 1717, and by letters patent of 1st October, 1763, declared the same to be imperative in almost all the provinces of the Austrian monarchy. This, consisting of 54 articles, contains directions relative to bills of exchange and to other points of commercial law. Various modifications, however, of later date, have passed on it. The law of bankruptcy is equally due to the care of Maria Theresa, although not promulgated before the reign of Joseph II. This law, not less important on account of the wisdom of its provisions than from its general extension throughout all the Austrian States, was to have come in force on the 1st of January, 1782, but in consequence of some accompanying difficulties, was not acted upon till the 1st of May following. It repeals all the pre-existing statutes in relation to bankruptcy. It presents at the same time certain undetermined points afterward provided for by later statutes, mostly inserted in the judiciary ordinances of Galicia. As all the provisions of this law were repeated in a new edition of the Lombardo-Venetian code, the most important points will be exhibited in that division under the title "Bankruptcy." The maritime legislation of Austria is the work of the same empress. It dates 25th April, 1774. She published the ordinance known under the title, "*Editto Politico di Navigazione Mercantile Austriaca*," attended thereafter by some other ordinances. The whole, however, is far from being a perfect system of commercial legislation. The "*Editto Politico*," which embraces the most extensive and the wisest

provisions in regard to captains and seamen, contains nothing on the subject of freight-contracts, of bottomry-bond, and insurances. In the absence, therefore, of legislative decision, reference is at present made, on the shores of the Adriatic, to the French "*Ordonnance de la Marine*" of 1682. These different laws are already of somewhat ancient date, and are by no means adequate to the new wants of commerce. We are led to this conclusion by the fact that of late there were being prepared in Austria two projects of law, the object of which was to embrace in the one the interests of inland commerce on which a great part of the new code of Hungary has been based; in the other, all the maritime legislation. Neither the one nor the other has received the legislative sanction.

3. *Baden, Grand Duchy of.*—From the 1st July, 1809, the French code has been in force within the Grand Duchy of Baden. Though the text of this has not been altered, and the same order of articles has been maintained as far as article 206, numerous additions, under the form of articles supplementary, have been introduced, particularly in what relates to commission, carrying-trade, and bills of exchange. We have inserted only these additional regulations. The civil code of the Grand Duchy of Baden, under the head of "Property," contains important provisions in regard to literary property. The second book on maritime commerce was necessarily retrenched. The fourth, on commercial jurisdiction, also has not been reproduced.

4. *Bavaria.*—Bavaria has no commercial code, nor even a commercial legislation, applicable to the whole extent of its territory. In the provinces where the Code Napoleon has been maintained, that is, in Rhenish Bavaria, the Code de Commerce is equally in force. In a similar manner, the districts which formerly belonged to Prussia, such as the principalities of Anspach and Bairenth, incorporated into Bavaria in 1803, have preserved the Prussian legislation. There are, therefore, none but the ancient provinces of Bavaria which are governed by special laws. This legislation, in what concerns commercial right, is extremely imperfect. In most cases, it is true, the defect is supplied by the common law of Germany and by the civil law, but the documents most important and complete, are three statutes: the first known under the name of the statute for Bavaria of 24th November, 1785, extending to all the provinces of the kingdom by the laws of 11th of September, 1825. The two others, that of 1778, for the city of Augsburg, and that of the 16th February, 1722, for the city of Nuremberg. We find in these three enactments regulations not only in regard to bills of exchange, but respecting merchants, brokers, partnership, and factorage.

5. *Belgium, Kingdom of.*—The commercial code of France, without any modification, has continued to regulate affairs of commerce in Belgium ever since the year 1814, the period at which a political separation between the two countries took place. The same judiciary organization has been in like manner continued. The single exception is, that a law has been enacted in Belgium (25th March, 1841) ordering that the tribunals of commerce shall give final judgment in causes that may come before them to the amount of 2000 francs, whereas in France the law of the 25th May, 1838, fixes the competency of the tribunals in the first instance at 1500 francs. Royal edicts have named commissions charged to prepare projects of law for the revision of the legislation in regard to bankruptcy, suspension of payment, partnership, civil or commercial insurances, writs of captem, mortgage seizure of real estate, accounts of law, expenses, marriage contract, possession and division of property. A law has been in progress on the proper interpretation of article 442 of the Code of Commerce. It was discussed in the Chamber of Representatives in the session of 1842, but was rejected by the Senate.

6. *Brazil, Empire of.*—A commercial code to which that of Spain has served as a basis, has lately been issued, but not being yet in our possession, we refer our readers to article BRAZIL.

7. *Bremen.*—Though the city of Bremen was one of the first in the ancient Hanseatic League, and is still among the most important sea-ports in Germany, its commercial legislation is extremely defective and incomplete. Statutes and legislative enactments bearing a very remote date, have fallen entirely into desuetude, and causes are determined either by the common law of Germany or by that of neighboring legislations, Hamburg, etc. Commercial disputes are determined by the tribunal of commerce, as in Hamburg. Bremen names two deputies to the Supreme Court established at Lubec for the four Hanseatic Towns.

8. *Brunswick, Duchy of.*—The city of Brunswick had formerly celebrated fairs. She obtained at an early period a special *ordonnance* in regard to exchange, which, renewed on 1st August, 1715, and afterward extended to the Duchies of Brunswick and Brandenburg, was still the law of the State until the law for bills of exchange for all Germany came into force. Another ordinance relating to bankruptcy, of date 26th March, 1823, is almost the only document of a commercial character to be found in the duchy; for with the exception of some recent decisions in the Court of Appeal of Wolfenbüttel in regard to mercantile accounts and factorage, and whose simple object was to give the force of law to usages already established, other enactments have been of a description so purely of detail, without bearing directly on commercial legislation, properly so called, that it has been thought unnecessary to do more than refer to them. In the Duchy of Brunswick commercial causes are determined by the ordinary tribunals.

9. *Cracow.*—The commercial code of France, of which an almost literal translation was made for the use of Warsaw, has not been officially repealed in the new kingdom of Poland. It appears unlikely, however, that legislation of French origin will be permanent in this country. In the city of Cracow the code just mentioned still maintains its authority. It is also in force throughout the Grand Duchy of Warsaw, having been introduced in 1808; Cracow at that time forming a part of the duchy. Only one alteration has been made in the code, namely, that which authorizes the notaries and the judges of the court to affix their seals to the property real or movable of a bankrupt, and to determine the dividend payable to the respective creditors. Commercial affairs have no special tribunal. They are carried before the ordinary courts as well in first instance as in cases of appeal. Three laws, the one of 15th October, 1819, relative to the public exchange (*la Bourse*), and the corporation of merchants, and the other two of the 1st March, 1821, and 19th May, 1833, on the freedom of commercial transactions, and on the restrictions to which in certain cases they may be liable, are not of sufficiently general interest to have a place given them here. There are certain articles of produce subjected by the Senate to a tariff, in which trading is not considered as a part of commerce, and only legal process of a civil character is allowed.

10. *Denmark.*—The enactments relating to commercial jurisprudence in Denmark are not at all numerous. In matters of exchange the ancient *ordonnance* of 1768, has been replaced by a later act of legislature of 18th May, 1825, which repeals all preceding deeds with the exception of that of 26th June, 1824, relative to some particular branches of the law on bills of exchange, the rescript of 22d March, 1769, and the proclamation of 8th November, 1799, in which are found regulations for bills upon the West Indies. The maritime law of Denmark contained in the code of Christian V., 1683, continues still in force. We

should have confined ourselves to an analysis of those regulations which possess only a historical interest; but we have felt the propriety of joining with them an analytic view of all the later enactments and laws which have served to complete, at this day, this ancient monument of maritime jurisprudence, and which we are enabled to present by the assistance of the excellent abstract of M. Poehls. As to bankruptcy, there exists no law which gives precise and fixed rules. *Ordonnances* of very ancient date, the meaning of which long custom has determined, constitute, on this subject, the legislation of the country. It would have been a matter of great difficulty to give a copy of these had not a valuable document, due to the labors of M. Orstedt, Attorney-General in the High Court of Copenhagen, and generally intended for the use of the French Conseil d'Etat at the time of the discussions on the projet de loi on bankruptcy (published 28th May, 1838), enabled us to present an abstract which will be found as exact as it is substantial and well arranged.

11. *France.*—France had, under the administration of Colbert, united, or rather codified, her commercial legislation, and collected in the two ordinances of commerce and navigation of 1673 and 1681, their principles, usages, and customs. Yet the want of a general code of laws was seriously felt until, with the entire reconstruction of her political institutions, Napoleon ordered the compilation of codes which, within a short period, were presented and adopted. With some unimportant modifications, they are still the basis of French jurisprudence. With regard to the administration of commercial law, the following is a summary of the report of the Minister of Justice for the year 1846, which deserves attentive consideration:—*Tribunals of Commerce.*—Commercial affairs are adjudicated by 220 special tribunals of commerce, established in the most commercial departments, and by 170 civil tribunals, which are charged to take cognizance of the same in the other departments. In 1846 there were introduced 207,279 new cases before these 390 tribunals; 177,446 have been brought before the 220 special tribunals, and 29,833 only before the civil tribunals, judging commercially. In 1845 only 191,687 cases were enrolled in the 390 tribunals; since 1845 the number has increased 38 per cent. On 31st December, 1845, there remained 7,932 cases to be adjudicated; 3,864 cases which were considered as terminated by compromise or abandonment, were brought before the court in 1846. These, united to the 207,279 new cases, form a total of 219,039 cases to be adjudicated. Of this number 59,323 have been adjudicated contradictorily, and 115,908 by non-appearance; 4029 have been submitted by the tribunals to arbitration, and 32,705 have been erased from the register as terminated by compromise or abandonment; 7678 only were left unsettled on the 31st December, 1846, or hardly 3½ per cent., while the civil tribunals left unsettled at the same epoch 26 per cent. of the civil cases brought before them. Of the 174,641 adjudications rendered in 1846 by the tribunals of commerce 84,569 only, hardly one fifth, were susceptible of appeal. The special tribunals of commerce have 1 court and 1 president only; the number of judges varies from 1 to 10, and that of the surrogates from 2 to 16. The tribunals of Paris and Lyons have each 10 judges, and of surrogates the first 16, the second 6; 8 tribunals have 6 judges and 4 to 6 surrogates; 1 only has 5 judges and 8 surrogates; 96 have 4 judges and 2 to 4 surrogates; 106 have 3 judges and 2 to 4 surrogates; lastly, 7 have 2 judges and 2 surrogates. In 1840 the tribunals of commerce of Paris had dispatched 56,276 cases, or more than one fourth of the total number. The tribunals of commerce which have dispatched most cases after that of Paris, are those of Lyons, 9841; Rouen, 4914; Marseilles, 4296; Bordeaux, 4137; Toulouse, 3723; that of Limoges,

2307; 21 other tribunals have adjudicated upon 1000 to 2000 cases; 11 tribunals composed of 3 to 4 judges have dispatched each 50 per year, and 16 others have terminated from 50 to 100 only. There were rendered, in 1846, 290 sentences by arbitration in disputes between partners, 169 of which with the assistance of a third. The greffiers of the tribunals of commerce have received the deposit of 2724 partnership deeds, of which 1989 in collective names, 459 in commandite, 235 by shares to nominated persons, and 41 by shares to the bearer, 39 anonymous partnerships, have been besides authorized by regulations of public administration; in all, 2747 partnerships of every kind. The greffier of the tribunal of the Seine alone has received 869 partnership deeds, almost the third of the total number. On 31st December, 1845, there remained 5964 bankruptcies to be liquidated. In 1846, 3795 new ones were opened; 3606 only have been terminated, and 6153, or almost two thirds of them were left unsettled at the end of the year; 1612 bankruptcies have been terminated by compromise; 1031 by liquidations; 829 have been closed by insufficiency of capital; lastly, there have been declared 134 judgments of bankruptcies. The tribunal of commerce of the Seine has terminated 896 bankruptcies in 1846, that of Rouen 193, of Lyons 131, of Bordeaux 60, of Marseilles 51. The passive debt of 356 bankruptcies which terminated in 1846, by agreement or liquidation, did not exceed 5000 francs; it varied from 5000 to 10,000 in 441 bankruptcies; from 10,000 to 50,000 in 1269; from 50,000 to 100,000 francs in 270; lastly, it exceeded 100,000 francs in 307. The amount of the active debt of 2943 bankruptcies liquidated was 51,819,891 francs; namely, in estates, 19,855,111 francs; and movables, 31,964,280 francs. The total amount of the passive debt was 143,544,671 francs; mortgaged debt, 19,257,540; privileged, 3,901,637; and ordinary, 120,385,494 francs. The loss borne by the ordinary creditors was, on an average, 76 per cent. The dividend obtained has been more than 75 per cent.; in 84 bankruptcies 51 to 75 per cent.; in 62 from 26 to 50 per cent.; in 594 10 to 25 in 1228; and 1 per cent. in 412. In 185 bankruptcies the ordinary creditors have received nothing; the assets having been absorbed by mortgaged and privileged creditors. Lastly, the dividends of 78 bankruptcies terminated by compromise have not been indicated, as the assets could not be realized immediately. *Court of Appeal.*—In commercial matters the number of judgments susceptible of appeal have been in 1846, 34,569. 2511 appeals were made, namely, 7 appeals for 100 judgments less than in civil matters; 1777 appeals only were adjudicated upon. 1212 judgments (68 per cent.) have been confirmed; 1565 (32 per cent.) modified in whole or in part; 602 appeals have been negatived. *Council of Prudhommes.*—68 councils existed, 4 of which did not sit in 1846. The 64 councils have had on hand 21,254 cases. The parties have withdrawn 3153 cases before they were settled; 16,140 have been conciliated; 1762 remitted to the bureaux-general, and 196 to the judge of peace.

12. *Frankfort.*—The ancient ordinance of Frankfort (26 May, 1739) relative to various points of commercial law, such as partnership, commission, and brokerage, has always continued in force. The Senate had in 1811 prepared a project similar in great part of its provisions to the French code, but which, from national feeling, was not adopted in 1814. In 1827, a new project of a code of commercial law was published, for the purpose of being submitted to jurists and to merchants. This project, however, has not hitherto received any legislative sanction; so that the ordinance of 1739 still remains as law. There exists in Frankfort no special jurisdiction for commercial matters: they are brought before the ordinary tribunals. There is a court of appeal, a municipal court, and a municipal or territorial bailiwick. The supreme

court of appeal sits at Lubec. Its jurisdiction extends to all the free cities of Germany.

13. *Great Britain.*—The mercantile law of England is almost entirely founded on what has been experienced to be most conducive to the welfare of society. Its origin is derived from many sources, while ancient commercial enactments were the basis of our maritime law. With the increase of commerce and general advancement of the nation, mercantile law grew in importance. Promissory-notes and the banking system were placed in their present state during the reign of William and Anne. Numbers of judges followed, whose commanding intelligence formed an epoch in the annals of jurisprudence. The names of Justice Hale, Lord Mansfield, and Lord Stowell, are rendered familiar from their being constantly referred to in the adjudication of the most subtle arguments on commercial law. Most of the commercial law of Great Britain is included in the common law; yet lately various enactments have passed consolidating the bankruptcy law, joint-stock companies, etc. The law of Scotland differs materially from that of England in contracts and bankruptcy. The mercantile law of this country is entirely included in the civil law, of which Erskine, Stair, etc., are the leading writers.

14. *Greece.*—Since the erection of Greece into a sovereign and independent State, its government has been engaged in fixing its laws and digesting the various codes. The civil law is still determined by the manual of Hermunapol, the latest compilation of the Byzantine emperors. The commercial code, which is but a textual repetition of that of France, with a few unimportant alterations, has been in force since 1st May, 1835. These alterations consist only in the suppression of Articles 615 to 630, relating to the organization of tribunals of commerce, in place of which there is the law of 1834. To complete the documents relative to the commercial code, we shall say that the law of 14th May, 1835, re-established the regulations of Arts. 631 and 641 of the French code, which at first had been suppressed. It is interesting to remark that the adoption of the French code was anterior to the Greek revolution; inasmuch as in 1821 it had been twice translated, and the merchants of Greece had unanimously adopted it. It was for the purpose of confirming this voluntary preference that his majesty Otho, by a royal declaration of May, 1835, gave the force of law to a translation executed by his command, and now acknowledged as the sole official authority. As to the judicial organization, it is similar to that of France. There is an innovation, however, which is of some practical utility; this is the being obliged to choose a jurist as president of the tribunal of commerce. All the articles of the commercial code are the same as the regulations of that of France, with the exceptions of the modifications duly noticed.

15. *Hamburg.*—Though the commercial laws of Hamburg are now of old date, and have frequently, particularly in later years, been sought to be submitted to revision, yet going back, as they do, to the statutes of 1603, and supplied, when defective, by enactments of greatly more recent date, they demand our notice; and the more so that they regulate matters not only in Hamburg but in the neighboring cities, such as Bremen and Lubec, where, properly speaking, there exist no commercial laws whatever. The enactments most recently made in regard to points embraced in the commercial code of France are the following: an enactment on the subject of brokerage, of 15th December, 1824, and another on partnership, of 28th December, 1835, the latter, however, having only for its object the deposit and publication of partnership deeds. The statutes of 1603, relative to mercantile books, have not been repealed by any later enactment. The law on bills of exchange is now similar to that of Prussia. The regulations in regard to maritime commerce

are still chiefly borrowed from the statutes of 1603. As they have been modified, however, by several more recent enactments, we have availed ourselves of the work of M. Poehls upon this subject. These will be found also in the proper place—the regulation in regard to maritime insurance of 10th September, 1731—of great importance to one wishing information, and remarkable for the completeness of its details. Bankruptcies, before the tribunals of commerce (a procedure which does not exist generally in Germany, where in cases of failure the process for a settlement between the parties is carried to the civil courts), have been regulated by an ordinance of 31st August, 1752. The commercial jurisdiction and competency of tribunals of commerce had been fixed by the law of 15th December, 1815, which appointed a tribunal of commerce at Hamburg for all commercial affairs. Prior to 1815 these were carried before the administrative authority, or before the Court of Admiralty when the affair was of a maritime character.

16. *Hanover*.—There existed, accurately speaking, no commercial legislation in Hanover till the period of the Prussian occupation in 1801. Immediately after this the Prussian code was introduced into the bailiages of Hildesheim, Verden, Haya, Diepholtz, Osnabruch, and Lenja. A royal ordinance of George IV., dated 23d July, 1822, confirmed it. It is still the existing law. In the other parts of the kingdom there exists, with the exception of the regulation in bills of exchange, of the same date (23d July, 1822), no law whatever, bearing on commerce. Actions are determined by usage and common law. The new penal code adopted in Hanover, 1840, fixes the penalties established in cases of bankruptcy. All commercial differences are brought before the ordinary tribunals. In most instances, however, they are terminated amicably by arbitrament, or they are decided by the municipal court which ordains according to common law, or, otherwise, acts in the capacity of a court of equity.

17. *Hayti, Republic of*.—The republic of Hayti has had, since 1828, its codes in uniformity with those of France. The commercial code is throughout the same as that of France. It was published on 28th March, 1826, and has been acted upon since 1st July, 1827. The other codes, those relating to civil and commercial procedure, penal and rural, form together, with the civil and commercial codes, one body of law, dated the 25th year of Independence, and produced by the labors of M. Blanchet, a distinguished member of the Parisian bar.

18. *Hesse, Grand Duchy of*.—The French code has been maintained where it had been introduced at the time of the French occupation in the Rhenish provinces. With regard to the other provinces such as Starkenburg and Hesse-Superieure, commercial legislation is regulated as much as possible in conformity with the French law, with the exception of the town of Offenbach, which had a special ordinance on the exchange, of date 4th March, 1829, the same as that of Frankfort. There are no tribunals of commerce in the Grand Duchy; commercial disputes are submitted, as in most parts of Germany, to ordinary tribunals.

19. *Hesse Electorate*.—Three ordinances only, and of very old date, exist in this State on commercial matters; the first, of 16th May, 1747, on bankruptcies; the second, of 21st November, 1788, on partnerships; the third, of 14th December, 1796, concerning commercial books. Although these three ordinances serve only to establish principles already recognized, and contain only a very limited number of provisions, yet we have thought it necessary to reproduce them. Independently of these ordinances, which are far from forming a sufficient body of commercial law, they generally refer either to the French code which has been in force for some time in this country, or to the common law of Germany.

20. *Holland*.—The code of Holland came into oper-

ation the 1st October, 1838. It passed under a severe ordeal, and it was delayed through the revolution which caused her separation from Belgium.

21. *Hohenzollern-Hechingen*.—(Principalities of Siegmaringer and Lichtenstein.) These States have no general procedure for commercial matters; the disputes arising on them are adjudicated by the ordinary tribunals. The principality of Lichtenstein is governed, for commercial matters especially, by the laws and ordinances of Austria.

22. *Ionian Islands*.—The French code of commerce, with a small number of modifications, most of which have been borrowed from the code of commerce of Two Sicilies, has recently been introduced in the United States of the seven Ionian Islands, which form an aristocratic representative republic under the perpetual protectorate of England. A decree of 16th March (26th February), 1841, abrogated all the laws, statutes, regulations, general or local customs, the requirements of which are contrary to the present code which came in force on the 1st May, 1841. At the same epoch of 1st May, 1841, the other codes of civil and criminal procedure, and the penal codes, had been promulgated; they are drawn up almost in the same spirit and system as the French codes.

23. *Lombardo-Venetian Kingdom*.—The French code of commerce has been almost entirely preserved in the Lombardo-Venetian Kingdom; only with regard to bankruptcies they refer to the Austrian legislation; namely, to the ordinance of 1st January, 1782, and to the more recent ordinances inserted mostly in the ordinance for Western Galicia, and later on in the judicial ordinance, for the Italian States of the Austrian monarchy. A translation in Italian of the French code of commerce has been recently published at Milan, where those provisions which have remained in vigor, and have the force of law have been reproduced; these provisions have replaced the French code, especially on bankruptcies. We have made use of this work as the most authentic compilation we could adopt; and have simply indicated the direct correspondence between them and the ancient ordinances or law of 1782, and the ordinance of Galicia, deeming this sufficient to show the various changes which have been made. Trieste follows entirely the Austrian legislation, namely, the ordinance of 1760 on bills of exchange; that on bankruptcies of 1782 modified by more recent laws, such as that of Galicia and others, and the political proclamation of Maria Theresa of 1673, on maritime commerce.

24. *Lubec (Free Town of)*.—Lubec, although a truly commercial city, does not, properly speaking, possess any body of commercial law. She borrows provisions relative to this matter either from the common law of Germany from foreign legislation, or from ancient statutes. The *Stadtrecht*, which is the foundation of the law of Lubec, is not sufficient for the wants of commerce. Yet, with all the imperfections of the law, attempts to improve it have proved abortive. The political constitution of Lubec, which goes as far back as the middle ages, demands, for the compilation or revision of the law, such minute and complicated formalities that even the most indispensable improvements are infinitely long delayed. Every project, in fact, after having been elaborated by a commission, and subjected to the examination of the Senate, must be successively discussed and approved by the eleven colleges of the *Burgess*. This mode of deliberating, isolated and multiplied, carries with it lengthened and incalculable difficulties. Practice very imperfectly supplies defects of the written law; because no regular jurisprudence can be established in a country where the inhabitants terminate their differences chiefly by arbitration. This is so true that in 1840 the supreme court established at Lubec, for the 4 free towns of Germany, had to adjudicate only upon 4 appeals made by the citizens of Lubec. Nev-

ertheless, M. Herbert, the French consul there, in 1841, transmitted to the Minister of Foreign Affairs in France, a remarkable work on such legislation as that of Lubec, that we think proper to give some extracts from it. Through his care and enlightened zeal, we are furnished with some valuable documents on merchants, also, on commercial books, brokers, on whom there exists a regulation of the 26th June, 1822, and on commercial jurisdiction. With reference to maritime commerce we have followed the treatise of Poehls, so methodic and complete. The *Stadtrecht* is silent on bills of exchange. The three ordinances of 14th November, 1669, of 5th March, 1738, and of 20th August, 1823, contain only provisions of simple procedure. The first prescribes some measure for prompt execution in matters of exchange; the second declares the right of appeal, but not its suspension powers; and the third leaves to the tribunals the faculty to examine whether a permission may be given to the natives of taking proceedings in matters of exchange. The reproduction of these texts did not appear to us necessary. Title IX. of the Third Book of the *Stadtrecht* is devoted to commercial partnerships; but their provisions are not in conformity with the developments that have taken place which ancient law could neither foresee nor regulate. Thus while expecting the enactment of a law on bankruptcy, and bearing on this subject, they are guided by the regulation of Hamburg. As for bankruptcies, the subject is so obscure and uncertain that it is now fifty years since merchants demanded some regulations; but difficulties, apparently insurmountable, have hitherto prevented any improvement. Still there exists a project prepared in the name of a commission by the Syndic Buchholz, a distinguished jurist. This project is to be submitted to the Senate. It seems that it is composed of more than 150 Arts. and that it approaches the French code in its spirit and as a whole. The title I. of the Third Book of the *Stadtrecht* contains some provisions still in force (the rights of creditors privileged, creditors drestant, etc., etc.), but which have reference more to individuals in general than to merchants. The "Bourse" of Lubec is regulated entirely by that of Hamburg, for the course of exchange, money and public funds. With respect to jurisdiction, commercial affairs are submitted to the civil tribunals of three different degrees, of which we will give some details.

25. *Lucca, Duchy of*.—An ordinance of 6th May, 1840, declares that the French code of commerce shall continue in force in the Duchy of Lucca.

26. *Luxemburg, Grand Duchy of*.—The French code of commerce has not ceased in the Grand Duchy of Luxemburg. Simply a decree of King William, of 3d April, 1817, modifies the articles 615, 640, and 641. It suppresses the tribunals of commerce, and it orders that commercial disputes shall be adjudicated by the ordinary tribunals.

27. *Malta*.—Much confusion exists in Malta, in the application of the laws in regard to commerce; a want of *facility*, which gives occasion to constant complaints. Their only guides are the "*Ordonnance of French Marine*," of 1681, and other old authorities, such as the Code, or "*Pragmatique*," of the Grand Master Manoel (which is only subsidiarily in force), or the code of 1784, of the Grand Master de Rohan, which bears the name of "*Municipal Law*," and is at present a very general authority. Subsequently to the date last given, proclamations emanating from the different governments which have succeeded each other in Malta, and in particular that of Britain, since 1800, have introduced or remodeled certain rules of jurisprudence in regard to various points of commercial equity. The result has been a sort of common law, generally adopted in practice, and acted upon by the tribunals. To promote this object, a collection of all commercial usages in the form of a manual, has been published by gentlemen of the legal profession; it

bears the title of "*Compendio di Diritto Commerciale Maltese (Malta, 1841)*."—Compendium of the Commercial Law of Malta. This collection presents an abridged view of the principles of Maltese legislation and jurisprudence, in the absence of any thing like a regular system of commercial law. It is a subject of regret that the English government has not followed up its plan in giving a code to the Ionian Republic by promulgating a similar one in Malta. (We understand that the civil code for Malta is already prepared and printed.) On the subject of bills of exchange, the want of legal arrangements has been peculiarly felt. In the mean time, the regulations in regard to maritime commerce, borrowed chiefly from the French shipping law, enter much into the necessary details, and form the principal part of the commercial law of the island. In the matter of bankruptcy, the ordinances of 1815 have established certain principles which, in the form of procedure especially, have been only imperceptibly modified by later enactments. These regulations treat bankruptcy as in England.—Chap. XVII.—in which it is stated, that should any difficulties occur in regard to procedure, reference should be had to the law of England. The judiciary organization, which dates from 1679, was terminated by the constitution of 1814. The maritime consularship was then reformed, and the name of tribunal of commerce imposed. Regulations were at the same time enacted for its suitable efficiency. The commercial code so many years under consideration, was revised by the council in 1847, on the recommendation contained in the able Report of Andrew Jameson, Esq., Advocate, Sheriff-depute of the county of Edinburgh. A commission was also named to revise the code of civil procedure, intended to remove many obstructions and delays in the administration of justice.—*Parliamentary Report, 1849.*

28. *Mecklenburg-Schwerin, and Mecklenburg-Strelitz, Duchies of*.—There exists in these Duchies no peculiar law relating to commerce. The only authority throughout their respective provinces is the common law of Germany. Rostock, however, has a municipal law peculiar to itself. A decree of this city was passed, 19th December, 1827, relative to bills of exchange.

29. *Modena, Duchy of*.—The duchy of Modena has no code of commerce. Reference is made to the opinions of the most celebrated writers, such as Casaregi and Ansaldo, and still more to Azuni, Baldasseroni, and Cassiani. In the absence of legislative enactment, in regard to commerce, the civil code is also most frequently appealed to, which in commercial differences alone permits to act by executory process.

30. *Nassau, Duchy of*.—Till the present period there existed in the Duchy no law relating to commercial rights, and the ordinance of Frankfurt on bills of exchange was the sole authority. The government has, however, recently promulgated the project of a commercial code, extending to every subject that might be contemplated by it. This project, which has been aided by the valuable co-operation of Messrs. Volpracht and Bertram, is in a great measure a repetition (as to the text almost always so) of the regulations of the code of Wurtemberg, of those of the *ordonnance* of Saxe-Weimar (20th April, 1819) on bills of exchange. Though the above *projet* has not yet been discussed at an assembly of the States, there is every probability of its being adopted in its present form, at least without any material alteration. We have accordingly inserted it in due order.

31. *Norway*.—Civil and commercial legislation remain in this country the same as in Denmark. Its union with Sweden, in 1814, produced no alteration. Two laws only were carried in the last *Storting* (Parliament) in 1842. The first, of date 4th August, on bills of exchange, given in its proper place, the second, of 29th June, and which has received the royal assent. This law, however, being merely a regulation on the right of engaging in commerce, which it limits, with

very few exceptions, to the citizens of commercial towns, we regard as not coming within the legal department we had assigned ourselves; we therefore omit it. There was recently in force a regulation in regard to exchange of Copenhagen, 16th April, 1681, as presented by M. Nonguier. This regulation has been replaced in Denmark by the law of 28th May, 1825. In Norway it has hitherto undergone no alteration except those of the recent law of 4th August, 1842.

The maritime law of Norway is the same with that of Denmark. The code of Christian, promulgated in 1683 in Denmark, and in 1657 in Norway, is still in force.

32. *Parma, Placentia, and Guastalla, Duchies of.*—The commercial code of France, which had been introduced into these duchies, still continues in force. Only the civil code of Parma contains regulations in regard to bills of exchange. These remain the sole distinguishing documents of commercial character.

33. *Portugal.*—On the 18th September, 1833, an ordinance of the King Don Pedro sanctioned a code drawn out by a jurist alone, and which, derived in great part from the Spanish and Dutch codes, has taken from them the most enlightened provisions, and added others, especially on the institution of the jury, for commercial matters.

34. *Roman States.*—The commercial code of France, suppressed in 1814, when the French ceased to occupy the Roman territory, has, notwithstanding, still continued in force in some of its provinces, and in 1821 was formally re-established throughout all the Papal States, by an edict of Pius VII., under the title of Provisional Law of Commerce. Certain modifications, however, of minor importance, and which were to remain only until the completion of a new code, were introduced. This code has not yet appeared. The edict of 1st June, 1821, contains, moreover, several enactments which have for their object the better organization of tribunals of commerce. In regard to this point, however, the legislative and judiciary regulations of 10th November, 1834, contains, in sections three and four, new provisions. The decisions of the tribunals of commerce may be carried before the ordinary courts of appeals. The new law, however, has not revoked a papal statute of date 27th February, 1830, re-establishing a court of appeal at Ancona, and of which we have also given a translation. The edict of 1st June, 1821, contains, besides, different judiciary enactments, several of which have been borrowed from the English code of civil procedure. Into the examination of these we felt it unnecessary to enter, the greater part being presented in the new legislative and judiciary law.

35. *Russia.*—As early as in 1700, Peter the Great conceived the idea of collecting all the ukases published since the code of 1649, but co-operation was wanting to carry it into practice. Nicholas completed this important undertaking. The *svod* was published with the ukase of 31st January, 1826. It is a complete digest where the old laws are inserted, yet conforming them to the progress of legislation and European civilization. The commercial part, forming the 11th volume, occupies an important place; it includes more than 2000 articles, and it contains very remarkable provisions, such as demonstrate the customs and usages of the inhabitants of this vast empire.

36. *Sardinia.*—After the events of 1814, which placed upon the throne the present family, the ancient laws published in 1723, an impression of which, with numerous additional provisions, had been published by King Charles Emmanuel III., the 7th April, 1770, were re-established in Sardinia, Savoy, and Piedmont. They remained in force as to commercial matters until the promulgation of the new code of commerce, which came into operation the 1st July, 1848. The city of Genoa alone has continued to be regulated by the French code since the Restoration, the exigencies of

this commercial port requiring the application of a more modern legislation, and one which would be in harmony with the laws and customs of other nations. The same motive has urged the enlightened governments of Sardinia to endow their country with new and more uniform provisions by publishing a code of commerce. The new code of 1843 follows entirely the French code, taking into careful consideration the laws voted for its amelioration by the French Chambers in 1817, 1833, 1838, and 1841. It has done more; it has almost always resolved any difficulties that have arisen in the practice according to the sense and judgment of the Court of Cassation, and often made reforms which experience had proved to be necessary. Among the various innovations introduced, it is necessary to mention that minors and females whom the civil Sardinian code—the same as the Macedonian and Velleine status consultus—considered as incapacitated to act for themselves, are, as regards the exercise of commercial profession, independent; which modification was certainly indispensable; adding also to the No. 6 of the French law in conformity with their jurisprudence, a presumption of the consent of the husband when the married female is engaged in trade. The code intrusts to the tribunals of commerce the inspection of books of commerce; it prescribes precautions already specified in the projects of law presented by the Garde-des-sceaux, before the Chamber of Deputies, the 15th February, 1838, with a view to put an end to the scandalous speculations of partnerships in commandite; it relieves partners from forced arbitration, and makes it optional, as in several modern codes; it dedicates a fourth book to this important matter, under a special title, in conformity with the provisions of our code of procedure; and it replaces the entire section of the French code which treats of disputes between partners, with most valuable provisions in the functions of the liquidators of partnerships. The exchange agents are, as the notaries in France, responsible for the signatures to bills which they negotiate when signed in their presence; their books, and those of brokers, form evidence of agreements among parties. With reference to bills of exchange, those drawn by the States of the king in a foreign country, may be signed by any person who may be subjected to imprisonment for non-payment, without distinction of rank, but, for inland bills, merchants alone may be prosecuted commercially; and it is further necessary that the bill shall not be drawn by order and on account of a third, in which case they are only deemed as simple promises. The endorsement, after the bill becomes due, and the security given by a person not engaged in trade, do not constitute procuration. It is worthy of remark that Sardinia has adopted the same metrical system for distances and measurement as in France. The second book relative to maritime commerce contains only regulations analogous to the French code, with the exception in reference to the sale of ships, which must be made by public act, under penalty of nullity; it prescribes also to the captain, express duty of ascertaining the good state of the ship before going to sea; it enjoins on him to watch with great care over the interests of seamen. Lastly, by the Art. 843, § 1, the negotiation of a bottomry-bond between persons not engaged in trade, produces the same effect as bills to order, and by the Art. 360, any convention which should have for its object to discharge the lender on bottomry-bond from the contribution to the common averages, is null. The regulations of the third book on bankruptcies are the same as those of the French law of 20th May, 1838. Simply they have suppressed the Art. 448 of the French code which declares null the inscriptions of mortgages taken within 10 days preceding the suspension of payment; and, also, they order the exposition of the names of all persons who fail at the hall of the tribunal of commerce during the whole of their lives unless they obtained a license.

The treasury advances the preliminary expenses of the procedure. With reference to the license, it can only be given by the Senate (court of appeal) after the accomplishment of many formalities. The tribunals have the same organization as in France; but the judges elected by the merchants are nominated by the king. An important modification has been introduced in Sardinia, as in Mexico, and in Spain; a lawyer (*consulente quidiziale*) is appointed to each tribunal as a counselor, but without a deliberative vote. This institution has doubtless great advantages, yet it is subject to great inconveniences, as if, for example, the *consulore*, through the influence of his acquaintances, should predominate in all the deliberations, and overrule the judges. Another innovation consists in the creation of a judge, delegated every week by the tribunals, who decides by himself all disputes below 300 francs, and judges without appeal all those which do not exceed 100 francs. The appeal is admissible only in disputes above 1200 francs, as before the enactment of the French law of 11th April, 1838. An article on imprisonment for debt has been added to the code; it fixes its duration in proportion to the sums due, and submits to it persons not engaged in trade for bills of exchange, drawn from or on foreign countries, when it results from maritime operations; and in consequence of frauds, or presumption of flight, and insolvency. There is not yet any regulation on the procedure before the tribunals of commerce. The publication of the code of procedure is shortly expected, the ministry having been occupied with it for several years past. A diplomatic treaty of 24th March, 1760, seems to place Sardinia, with respect to France, in a very exceptional position relative to the execution of judgments rendered by the Sardinian tribunals, and the payment of the security *judicatum solvi*.

37. *Saxe-Attenburg, Saxe-Coburg Gotha, and Saxe-Meiningen*.—In these duchies there exists, in regard to commerce, only a very small number of regulations. Commercial differences are decided before the ordinary tribunals, and, in general, by a reference to common law and usage much more than to particular statutes. Thus, for example, the practice of Leipsic is the principal guide to that of the two duchies of Saxe-Attenburg and Saxe-Meiningen.

38. *Saxe-Holdburghausen, Duchy of*.—The ordinance of Leipsic, which was introduced into this duchy in virtue of a rescript of 11th June, 1714, still continues in force.

39. *Saxe-Weimar*.—A number of laws, entering into considerable detail, on the subject of mortgages, and the proper distribution and precedence of creditors in cases of bankruptcy, were promulgated by the government in 1839 and 1841. Their object, however, is only to establish, in regard to the latter subject, a uniformity of rule, such as is required in any other civil arrangement. For books of merchants, partnership, brokerage, failures, there exist no other special regulations. The Prussian code is followed, or, as in other parts of Germany, actions are decided by usage and common law. There is no special tribunal of commerce in the Grand Duchy. It is proper, however, to remark, that, during the continuance of the wool-fair, which is annually held in Weimar, in the month of June, a commission is named by the burgomaster, composed of two members of the municipality and several merchants, for the purpose of deciding upon differences that may occasionally arise. There being no commercial town in the Grand Duchy, no Bourse (place of exchange) has been regularly established. Each city has its particular regulations in regard to fairs held in it.

40. *Saxony, Kingdom of*.—The government of Saxony are at present occupied in the revision of the ancient legislation, and in completing it by new laws. As yet, however, there exists no commercial code, not even in the form of a "*projet*." The tribunals are

guided by ancient statutes and ordinances, which, where no enactments exist, are considered as possessing uniform authority. Various regulations have passed in regard to brokerage. Their respective dates are 7th March, 1818, 21st September, 1833, and 14th April, 1832. In regard to payments and bankruptcy, the only legal authority is the ordinance of 20th December, 1766, promulgated in Lusatia in 1783; this answers, however, very insufficiently for the present requirements of commerce, and government are preparing to replace it by new enactments. The ancient tribunal of commerce established at Leipsic, by an ordinance of date 21st December, 1682, still exists, but simply as a local court, and without any effort being made to establish other tribunals upon a common principle of judiciary organization. Such is the present state of commercial law in Saxony, to which the government are now endeavoring to apply a remedy. In addition to other means for this purpose, M. Einert, one of the most distinguished jurisconsults of the country, has lately received an order to review the recent laws, so as to bring them still more into unison with the increasing demands of commerce and industry.

41. *Schwartzburg, Rudolstadt and Schwartzburg-Sondershausen, Principalities of*.—As in the greater number of the minor States of Germany, so in the above principalities, commercial differences are brought before the ordinary tribunals, and are decided upon according to common law usage, or even the laws of the neighboring States, Saxony, etc. The former ordinance of 1st September, 1787, respecting failures, has been replaced by another of 1st December, 1835, on the same subject.

42. *Sicilies, Kingdom of the Two*.—The French commercial code was introduced into Naples the 28th May, 1808, when the throne was occupied by King Joseph Napoleon Bonaparte. The laws, having undergone a general revision at the time of the Restoration, a new code of commerce for the Two Sicilies was made public 26th March, 1819. It forms one of the parts of a body of general law, arranged under the five heads of civil, penal, and commercial law, and civil and criminal procedure. This code of commerce contains nearly the same regulations as that of France, on the basis of which it has obviously been founded, and which long practice besides has sanctioned.

43. *Spain*.—In 1827 King Ferdinand VII. nominated a commission charged to frame a code of commerce; and on the 30th May, 1829, a royal ordinance sanctioned the new code, which was to come into force the 1st January, 1830.

44. *Sweden*.—For bills of exchange in Sweden there are two ordinances, of 1st February, 1748, and 12th June, 1816. The text of them has been given by M. Nonquier in his treatise. It appears, however, that these ordinances have been insufficient for the wants of commerce. Accordingly, on 20th May, 1835, there appeared a new law regulating inland bills. This law, which is perfect in itself, and may be considered as the common law of exchange in Sweden, forms, with the ordinances already mentioned, an extremely remarkable body of laws. In relation to maritime law, a complete account of it, as it formerly stood, may be found in the collection of M. Pardessus. He has given there the ordinance of 1667, being an abstract of the Hanseatic *Reces* Maritime Consulate, etc. Numerous changes, however, have since been made in this ordinance, certain articles having been retained, while others have been suppressed or modified. On the present state of the maritime law of the north, the work of M. Poehls may be regarded as of the highest authority. A law, very minute in detail, was issued in regard to failures, in 1818. This has been more recently replaced by a new law of date 12th March, 1830, having regard to some modifications made in it in 1835. In regard to judiciary organiza-

tions, it is sufficient to note that, generally, the settlement of commercial disputes devolves on the civil tribunals. The only exceptions are proceedings relative to bills, or arising from disputes which may have arisen between ship-owners and the proprietors of the cargo, or the captains, or between captains and their seamen. Actions in regard to these are within the competency of the municipal courts. The same tribunals take cognizance of ordinary failures. If the bankrupt is a noble, the case is brought before the courts of justice. To these also an appeal lies from the decisions of the municipal tribunals. When there is room for appeal from an inferior district court, it may be carried in the second instance before a superior one; and in the third (finally) before one of the three high courts of the realm.

45. *Switzerland*.—Each of the twenty-two Swiss cantons is sovereign and independent, ruled by its own laws. There exists, however, in the greater part of them, no commercial law whatever. Matters of commerce are treated as other affairs of civil life, with all the restrictions and impediments which have been the fruit of municipal legislation. In the Canton of Geneva, the French code, introduced provisionally after the events of 1814, seems now to possess the authority of definitive law. No change has been made in it, except in what regards the mode of legal procedure, delineated in the "*Code de Procedure*," arranged by M. Bellot, and promulgated 1st January, 1821. A law of 12th May, 1817, giving a new sanction to the French code of commerce, established those changes already adopted in France, and introduced into the art. 160 a provision having special reference to Geneva, namely: "The loss of right mentioned in the art. 160, shall take place against the bearer of a bill of exchange, at one or more days after sight, or months or usances after sight, drawn from the Canton of Geneva, payable in foreign countries, who shall not exact the payment or acceptance within the time prescribed by each of the prefixed dates." In the other French Cantons of Switzerland, the same French code, though not expressly enacted, is frequently, in the absence of other legislative authority, the guide, or is at least appealed to as a rule of equity. The Canton of Vaud has published a law on bills of exchange, the 4th June, 1819, which is chiefly extracted from the French code, and which has been also adopted in the Canton of Friburg. In 1818, the Council d'Etat of the Canton of Vaud had prepared a report of a code of commerce to be submitted to discussion, but it was rejected in 1841, by the Grand Council. The Canton of Friburg, in 1840, presented the *projet* of the first book of the "*Code de Commerce*;" it has not yet, however, undergone discussion. Lastly, Neuchâtel has recently published some commercial laws. The legislation in the German Cantons is extremely imperfect. The least defective system of mercantile law is that of Basle, in which, in addition to an ordinance on exchange, of 14th December, 1808, there are to be found various regulations in regard to mercantile books, brokerage (26th Dec., 1822; April, 1805 and 1817) as well as some old regulations (1719) relative to the ranking of creditors in a case of bankruptcy. The latter also still retain some degree of authority, and are therefore not without importance. Recently, in the Canton of Berne, the discussion as to the propriety of maintaining the codes of France in the French portion of the Canton, seems to have led the way to important reforms, having for their object the revision, not only of these codes in certain articles, but of the entire legislation of the country. This legislation is composed of very ancient laws, which could not be included in this work. The law on bankruptcy, of 22d December, 1820, contains some very remarkable provisions. The new civil code of Lucerne embraces various regulations on commercial matters. Zurich possesses an ordinance on

bills of exchange, of date 16th May, 1805. St. Gall, an ordinance on the same of 18th July, 1784, and a law of 11th October, 1832, on commercial accounts. Lucerne follows the ordinance on bills of exchange of St. Gall; Soleure, that of Basle; and Friburg has the same law as Vaud on bills of exchange, of date 24th June, 1829. In the German Cantons the defects of commercial law are supplied partly from the civil law, but chiefly by usage. Commercial disputes are determined before the ordinary tribunals. A law on bankruptcy, of 18th May, 1818, for the Canton of Zug, contains some curious regulations in regard to religious establishments, in favor of the bankrupt himself, who preserves the right of redemption over the sale of his real estate, and against his family in certain cases. There still exists at Schoffenhausen a committee of commerce which traces its origin to the year 1703; similar ones were to be found in several cities in Switzerland. Its members were elected from the mercantile body, and were appointed to watch over every thing that concerned the commerce of the city. In 1805 it was erected into a tribunal of commerce for the decision of all mercantile differences. It is much to be wished that Switzerland, especially in regard to commercial affairs, were possessed of a common legislation applicable throughout the whole extent of the confederations. It is possible that the late reforms in the civil and the criminal codes of the Cantons individually, may lead eventually to this result. In certain cases, indeed, the Cantons have already felt it necessary, amid the multiplicity of statutes and usages, to adopt certain measures of a general character, by federal conventions or *concordats*. Thus, in a case of bankruptcy, by the concordat of 15th June, 1804, confirmed 8th July, 1818, every Swiss throughout all the Cantons, enjoys, on ranking as creditor, the same rights with the inhabitant of the Canton in whose jurisdiction the bankruptcy has been declared, both in regard to preferable and to ordinary claims. No seizure can take place of the movable property of the bankrupt, except for the common interest. Three Cantons only—Schwyz, Glaris, and Appenzell—refused their adherence to this federal agreement: their particular legislation seems to oppose it. By another concordat, 7th June, 1810, confirmed 8th July, 1818, the Cantons have mutually decreed that all the effects of the bankrupt, wherever found, must go into the general mass, without prejudice, meanwhile, to the claims of the present holder. In the case, however, of the body of the creditors contesting either the *property* of deposits, or a mortgage or ownership security situated in a different Canton from that in which the bankrupt was domiciled, the claim must be carried before the competent judge in that Canton, where the said effects, mortgage, or security, were found. By virtue of art. 14 of the treaty of alliance between France and Switzerland, Frenchmen and Swiss are respectively exempted, in pleading before the courts of each other's country, from the obligation to furnish a "*judicatum solvi*." The Court of Cassation, 9th April, 1807, and the Court of Colmar, 28th March, 1810, have specially determined to this effect; and the law may be considered as fixed.

46. *Tunis*.—There is no commercial law in Tunis. Usage and particular articles of agreement direct the decision in those cases of dispute that may occur between native traders. Every trader keeps a book in which he registers his purchases and his sales. The native Mussulmen and Jews know no higher form of mercantile book-keeping. There are few countries, however, where commercial probity is found more prevalent. And though cases may occur, in which the confidence of the creditor or the equity of the judge are attempted to be worked upon, yet such are proportionally rare, when compared with similar instances among nations where the written laws of commerce are of a more definite and extended character.

47. *Turkey*.—The geographical position of Turkey was destined to form this rich country into an essentially commercial power. But the natural indolence of its inhabitants has prevented it from reaping the advantages which nature had lavished on it. Their foreign trade is almost exclusively carried on by strangers, who enjoy, by virtue of diplomatic treaties, the privilege of paying dues of customs of smaller amount than those which are exacted from the Mussulmen and Rayas, and possess the right, in cases of differences with other foreigners, of appealing to their own international laws. The Koran is the common law according to which causes among natives are almost always decided. It is no matter of surprise, therefore, that there exists no special law applicable to matters of commerce. Those enactments which seem to bear the nearest resemblance to such, are scattered throughout the general code—a collection of all sorts of laws; to which, moreover, the idea of religious sanctity is attached, and which have been brought together by various doctors for the purpose of regulating religious services and public administrations. The collection of highest authority is that which was compiled by order of Solymán II., from 1520 to 1566, entitled *Multeka Ehbar*. This code has been translated by Chevalier Mourudja di Hossen, a native of Constantinople, of honorable Armenian family, and dragoman (interpreter) to the embassy of the King of Sweden. The work appeared in France, the first two volumes in 1798, and the third in 1824, under the title of “*Tableau General de l’Empire Ottoman*,” and presents an accurate exhibition of the laws which govern that vast empire. This code contains a book on commercial matters, but the laws embraced in it refer rather to principles bearing upon civil contracts, and adapted to Mussulman manners, than to commercial right, properly so called. Under the administration of Ahmed-Fetich-Pacha, in 1839, a project of a commercial code was prepared on the model of that of France. The fall of that minister, however, has indefinitely deferred its publication. As to commercial jurisdiction not falling under the rule of common law, actions in regard to it were determined at Constantinople and in the principal sea-ports of the Levant, by the chief officer of the custom-house (*chef de la douane*), aided by several assessors chosen from the leading merchants of the place, Mussulmen, Rayas, and freemen. This court, however, had been suppressed in the capital, and the Ministers of Commerce, similarly aided by assessors from the same class of merchants, have for some time taken cognizance of all commercial affairs. It was the wish of the Porte that disputes between Ottoman subjects and Europeans, should be carried by petition before this tribunal without the presence of any European assessor, and subject only to the interposition of the interpreter of the ambassador of the respective country. The entire diplomatic body were opposed to this, and the ministry of commerce has been abolished. The former order of things has now been re-established, and the Grand Douanier (the officer already mentioned) presides as formerly in the tribunals. Its decisions are final. “A cause,” says the religious code, “legally examined, discussed, and determined, can not again be brought into court, the law having pronounced against all appeal.” The judgments which it pronounces are not founded on any well-defined usages. The code of France is generally the rule to which, in their private transactions, the Rayas, who hold a seat in the tribunal, are accustomed to defer. The tribunal of commerce is not the only tribunal existing in Constantinople. There are other three, namely: 1. The *Arz Odassez*, a supreme tribunal where formerly the Grand Vizir presided, now the Cheik-ul-islam (*mufit*), before whom, without appeal, differences of every kind are determined, save on commercial and maritime subjects. 2. The tribunal of the *Cadis*; the *Mehkeim*, a

sort of court of peace or conciliation. 3. The court of the *commandant du port* (governor of the harbor), *Leiman-Odassy*, who, assisted by several captains, judges of all maritime questions, insurances, shipwrecks, jettisons, etc. Commercial differences between the subjects of the Grand Seigneur and those of foreign powers who are residents in the Ottoman empire, are determined summarily in presence of an interpreter of the legation, or of the consul of the nation to which the foreign subject belongs, sometimes by the decision of the custom-house authority, sometimes by that of the Pacha. In consequence of foreign treaties, every process involving a subject exceeding 4000 aspres (about 8 francs each) may be forced before the *divan* in Constantinople. This privilege, however, is seldom made use of. In cases of dispute between the subjects of foreign powers, a decision is given by the consuls of the respective parties, assisted by merchants of both nations. The Turkish tribunals decide on actions brought before them by the commentaries of the Koran, of which there are four in number, namely, as follows: the *Hanafi*, the *Maleki*, the *Chafiy*, and the *Hambuli*. These have never been translated from the original language. The *Hanafi* is followed at Constantinople and throughout European and Asiatic Turkey; the *Maleki*, in Barbary; the *Chafiy*, in Egypt; the *Hambuli* is no longer used; the collection entitled *Multeka Ehbar* is known over the whole empire.

48. *Tuscany*.—The “*Code de Commerce*” has always, since it was introduced into the Grand Duchy, held its position as law; and with the exception of the suppression of the tribunals of commerce, which, notwithstanding, have been continued in Florence itself, it has undergone no alteration of any importance. The article 117, however, of the judiciary reform of 1838, has annulled the regulations of article 51 of the French code, relative to obligatory arbitration in matters of copartnery. An ordinance of 5th September, 1814, with a view to prevent the facility with which persons not engaged in trade sign bills of exchange, authorizes only bankers, merchants, and traders, to draw bills of exchange. In cases when on such bills there should be the signatures of others than merchants, the ordinance grants only a recourse against them through the civil procedure. Another ordinance of 23d November, 1818, prescribes certain measures proper to shorten the procedure in matters of bills of exchange. Lastly, a third ordinance, of 20th December, 1824, declares that the words *value exchanged*, in bills of exchange, shall be considered as a true cause. We may also announce an important resolution of the jurisprudence of the court of Tuscany, by which a failure does not destroy the provision of funds for a bill of exchange; a question much disputed in France, and which the Court of Cassation has adjudicated upon in a manner contrary to the judiciary decisions of the tribunals of Florence, by decrees of 7th February, 1816, 30th July, 1832, and 20th March, 1841. We may add that the article 130, of the new Sardinian code of commerce, contains a regulation in conformity to the jurisprudence of Tuscany. An ordinance of 6th August, 1827, has made alterations in regard to insolvency and bankruptcy. It confers on the Advocate Fiscal (public prosecutor), or his substitute, the same powers with those of the public minister of France. The same ordinance proceeds thereafter to abrogate the enactments of article 587, of the French code of 1807, relative to those cases in which proceedings might be taken against a simple bankrupt. The court above mentioned in Florence consists of two merchants who are judges, two surrogates, one judge, a professional lawyer, and a “*greffier*.” The judges-consular are chosen by the principal merchants; the list of nominals is laid before the Grand Duke for approval. The judgments awarded by this tribunal may be carried by appeal before the tribunal “*de la vote*,” and finally before the council of justice. All maritime cases are

under the jurisdiction of the "bureau de la Marine," at Leghorn. In the other provinces of Tuscany the tribunals of commerce have been suppressed, and the cognizance of commercial affairs transferred to the civil judges, whose jurisdiction is unlimited.

49. *United States*.—The commercial law of the United States is, in general, the same with that of England. The principles connected with it are almost always traceable to the latter source; modified, however, by the legislation of individual States, as well as by the decisions of the federal court of the Union, and other inferior tribunals. English laws are not valid as such. They must be sanctioned by legislative enactment, or introduced by a court, as an exposition of principles common to the two nations. Each State has a separate commercial legislation. This is founded either on express statute, or on decisions of court. But as the decrees of the different courts have a sort of authority of themselves, and as, in addition to this, questions in relation to commerce emanate from general principles, or consist only in determining the proper interpretation of the contracts, commercial law may be said to be the same, or, at least, to vary very inconsiderably throughout the Union. Numerous questions on commercial affairs are decided by the federal courts of the Union (district and circuit courts), held for the purpose of taking cognizance of civil disputes between inhabitants of different States, and of all cases of admiralty and maritime jurisdiction. The final revision of the decisions of these courts is generally competent to the Supreme Court of the United States, which, differing from the Court of Cassation in France, judges both in regard to fact and law; and the decrees of which, while not considered as determining the principles of legislation or jurisprudence, have, indirectly, great influence in giving uniformity to the decisions of inferior courts in the several States of the republic. Though each State is in itself independent, yet laws of a general and uniform character may be enacted by Congress. For example, article 1st of section 8 and section 4 of the Constitution of 1787, provides, that Congress shall have the power, in the matter of bankruptcy—a subject of so grave interest in America, and affecting so deeply public credit—to enact laws that shall be obligatory on all the States, and take place of local enactments, whatever these may be. Under a general view, the tribunals must form their decisions on the basis of four sufficiently defined elements: 1st. The common or imperfectly written law. 2d. The statutes of the particular States. 3d. The legislative acts of Congress; and 4th. The decisions of English courts and treatises on English jurisprudence to which lawyers are permitted to appeal, as *raison écrit*, professional decision reduced to writing. There are no tribunals of commerce in the United States. Commercial or maritime questions are determined in the first instance by the ordinary courts appointed in each State. There are many exceptions, however, viz.: 1st. Of maritime civil causes such as seamen's wages, mortgages, salvage, engagements of vessels, etc., in general, of every real action against the vessel, or even in certain cases against the cargo. 2d. In the case of seizure of the ship or cargo. 3d. In regard to patents for discovery, rights of authorship, etc.; and 4th. In an action intended by a citizen of one State against a citizen of another. In all these cases the jurisdiction devolves on the federal court of circuit or of district. Though the judges have no political privileges, they possess each in his own sphere, great power; inasmuch as they may refuse to apply the law on the ground of unconstitutional impropriety in particular cases brought before them—an ingenious but sure method of fixing the character of imperfection on a particular law. In order to place in one view the documents necessary to give the most perfect view of American legislation on the various matters contained in a com-

mercial code, it was necessary to have recourse to the best accredited expositions and commentaries, and to which the Americans themselves attach the highest authority. The author generally followed, as the most accurate, is Chancellor Kent, whose *Commentaries on American Law*, presents an admirable and general view of commercial legislation. With reference to bankruptcies, the Congress having made use of the power granted to it by the Constitution, voted 19th June, 1841, a general law for all the States of the Union, which came in force 1st February, 1842. See *INSOLVENCY*.

50. *Wallachia and Moldavia*.—These principalities are ruled by laws, originally a mixture of Roman law, and usage. More recently the laws of the Lower Empire came into force, and retained their authority to a period not yet remote. The position of the two countries, pressed by the great powers which surround them, has led them to feel the importance of stability in civil legislation. For this purpose there have been established organic regulations, with a view to protect the citizens against the usurpations of the governing authorities, as well as to render secure the rights of the principalities against their powerful protectors. A desire has been felt also to preserve the traditional usages which are the expression of national habits, though sometimes these usages are not perfectly in harmony with the French legislation, which has been adopted as the leading authority. The aristocratic principle is maintained in all its rigor in their laws. As the primary element in that principle is the preservation of the great estates, the law confers on parents, according to their rank, and, failing these, on inhabitants of the locality, a preference in the right of purchase, and also a power of redemption on the sale of immovable property. In the case of encroachments on contiguous property, prescription is not admitted. So jealous indeed are the inhabitants in preserving their estates intact that the property conveyed in dowry by the wife (such is the rigor with which the dotal system is carried into execution), is freed from obligation to a leasehold by the simple fact of marriage, if the husband refuses to confirm the lease; a regulation greatly tending to shackle and discourage the labors of the agriculturist. In 1840 a commercial code was laid before the General Assembly, containing, with a few alterations, the same regulations with that of France. It has 595 articles. After having been adopted by the General Assembly it received the sanction of the prince, June, 1840, and was to come into force 1st January, 1841.

CHRONOLOGICAL TABLE OF COMMERCIAL LAWS.

Date.	Title.	Countries.
B.C.	Maritime Law of Menu.....	India.
B.C.	Maritime Law of Burges.....	India.
	General Code of Malacca.....	India.
B.C.	Law on Contract, Usury, Factor, Exchange, Debtor and Creditor, Partnership, Books of Commerce, Maritime.....	Greece.

Lead (Ger. *Bley*, *Blei*; Du. *Lood*, *Loot*; Fr. *Plomb*; It. *Piombo*; Sp. *Plomo*; Rus. *Свинetz*; Pol. *Ołow*; Lat. *Plumbum*; Arab. *Anuk*; Hind. *Sisa*; Pers. *Surb*), one of the most useful metals. It is of a bluish white color, and when newly melted is very bright, but it soon becomes tarnished by exposure to the air. It has scarcely any taste, but emits, on friction, a peculiar smell. It stains paper, or the fingers, of a bluish color. When taken internally, it acts as a poison. It is one of the softest of the metals; its specific gravity is 11.35. It is very malleable, and may be reduced to thin plates by the hammer; it may also be drawn out into wire, but its ductility is not very great. Its tenacity is so small, that a lead wire 1-126 inch diameter is capable of supporting only 18.4 lbs. without breaking. It melts at 612°.—*Tromson's Chemistry*. Lead is a metal of much importance in the arts. Its durability and malleability make it very suitable for the roofing of buildings, the construction of gutters, and such like purposes. It used to be very extensively employed in the formation of water-pipes and

cisterns. But though water has no direct action on lead, it facilitates the action of the external air; and hence the lead of cisterns and of pipes from which the air is not entirely excluded becomes oxydized, and is covered with a white crust at the point where the surface of the water comes into contact with the air. Inasmuch, however, as this oxyd is extremely deleterious, lead pipes and cisterns are now very generally superseded by those of cast iron. At present, perhaps, lead is more extensively used in the manufacture of small shot than in any other way. Its salts, though poisonous, are used in medicine to form sedative external applications; and frequently not a little, by the disreputable wine merchant, to stop the progress of acetous fermentation. Wine thus poisoned may, however, be readily distinguished; a small quantity of the bicarbonate of potass producing a white precipitate, and sulphureted hydrogen a black one. Pure wine will not be affected by either of these tests. "The oxyd of lead enters into the composition of white glass, which it renders clearer and more fusible; it is also used in glazing common earthen vessels; hence the reason that pickles kept in common red pans become poisonous. Lead, with tin, and a small quantity of some of the other metals, forms pewter; with antimony, it forms the alloy of which printing types are made."—*JOYCE'S Chemistry*. Mines of this valuable mineral have been wrought in England from the era of the Romans. It does not, however, appear that it was obtained any where except in Derbyshire, till 1289, when it was discovered in Wales; and the fact that silver was found intermixed with the Welsh ores having transpired, gave a new stimulus to the business; but in other respects the discovery of silver was of no use; the quantity obtained being insufficient to defray the cost of its separation from the lead. At present, the most productive English lead mines are situated in Northumberland; in Cumberland; in the western parts of Durham; in Yorkshire; in Derbyshire, and in Cornwall. The Welsh mines are principally situated in the counties of Flint, Cardigan, and Montgomery; those of Scotland in Ayr, Kirkcudbright, and Lanark; and those of Ireland, in Wicklow, Down, Limerick. Lead mines are also wrought to considerable advantage in the Isle of Man. We subjoin an abstract deduced from the accounts furnished by the Museum of Practical Geology, of the

QUANTITIES OF LEAD ORE AND LEAD PRODUCED IN GREAT BRITAIN, IN 1852.

	Lead ore. Tons.	Lead. Tons.
England.....	62,411	43,818
Wales.....	18,379	13,708
Ireland.....	4,493	3,223
Scotland.....	3,499	2,881
Isle of Man.....	2,415	1,885
Total.....	91,193	64,961

"In 1852, 14,124 tons of lead were imported, and 26,548 tons (including 2,967 tons foreign), were exported. It consequently follows that the produce of British mines is sufficient not only to supply the home demand, but to furnish a surplus of 9,457 tons for exportation. Pig lead was worth, in the London market, in September, 1853, £22 10s. 6d. a ton. In 1832 it was only worth £13 10s. a ton.

"Lead, when first extracted from its ore, always contains a certain portion of silver, varying from a few grains to 45 oz. or more in the ton. When the silver mixed up with the lead is sufficient to repay the expense, it is usual to separate it, which is effected by the process termed *refining*. The lead of some of the English mines, especially those of Cornwall, and, also, of the Isle of Man, contains very considerable quantities of silver, and our readers will, perhaps, be surprised to learn that it has been estimated by the highest authority that, in 1852, the United Kingdom furnished no fewer than 818,325 oz. of silver, worth, at 5s an oz., £205,080, obtained from lead."

The consumption of lead in France has greatly increased within the last 20 years. In 1852, about 30,000 tons of ore were imported, of which from 8-10ths to 9-10ths were brought from Spain.

The lead mines of the United States are principally

situated in Illinois and Wisconsin, on the Upper Mississippi. Their produce and that of the other mines in the Union, may, perhaps, average from 16,000 to 18,000 tons a year. Lead ore is also found in abundance in Missouri.

1856.....	*	*	6 00

* Estimated at 25 per cent. less than 1855.

The following tables show the quantity of lead of Western production received in the port of New Orleans from 1844 to 1855 inclusive, and also of foreign lead, paying 20 per cent. duty, imported into the port of New York, from 1849, the first year of late importations of this staple, to 1856, both inclusive:

Years.	Received at New Orleans, and mostly forwarded to northern cities of U. S.	Foreign lead imported into New York.
	Pounds.	Pounds.
1844.....	44,746,830
1845.....	51,248,750
1846.....	54,977,580
1847.....	46,509,030
1848.....	36,487,620
1849.....	35,598,990	28,375,000
1850.....	29,078,600	30,004,240
1851.....	22,785,350	49,464,120
1852.....	18,729,480	88,451,000
1853.....	14,720,090	37,918,160
1854.....	2,456,000	55,948,900
1855.....	3,000,000	40,327,140
1856.....	1,300,000	42,281,680

Estimating the American lead to weigh 70 pounds each pig, and the foreign 140 pounds each, which is deemed about the average of both.

LEAD RECEIVED AT ST. LOUIS FROM WESTERN MINES.

Years.	Pigs.	Pounds.
1854.....	306,827	= 21,470,890
1855.....	315,677	= 22,097,890
1856.....	204,656	= 14,325,920

In 1844 the Galena mines produced 51,494,860 pounds of lead, and the price at St. Louis was about 3 cents per pound. In 1856 they landed at St. Louis 14,325,920 pounds—less than one fourth the supply of 12 years previous, and the price was about 6½ cents per pound, thus being more than doubled. In 1854 there was imported into the single port of New York 55,945,900 pounds of foreign lead—more than the Galena mines ever produced in any one year. Doubling the price, doubling the demand, has reduced the production to one quarter, and it is certain that in 1857 the western manufacturers of lead will have to procure a portion of their staple from imported foreign lead in the Atlantic cities.

The production of lead at the Galena mines, of late years, has been materially reduced by the discovery of gold in California

White Lead.—The manufacturers of white lead, shot, lead pipe, etc., have petitioned Congress to place the raw material, pig lead, on the free list, and the committee reported favorably on the subject. The petition was signed by all the leading houses engaged in the trade, and the facts presented in favor of their request are numerous and conclusive. They say that for a long time previous to 1849 the domestic supply of pig lead was more than adequate to the entire domestic demand. Up to 1847 the Galena mines steadily increased in productiveness, and kept pace with the increase in consumption. Since that year the consumption has been in advance of the home supply, and the manufacturers on the seaboard have had to pay comparatively high prices for the raw material, the western States now manufacturing nearly all the pig lead they produce. Out of 60,000,000 pounds of pig lead imported into New York in 1854, only about 2,500,000 pounds were American. The duty on pig lead, by the tariff of 1846, was 20 per cent. *ad valorem*, and at the time that act was passed, it protected all domestic interests, for we produced as much lead as the country consumed. Since 1848 we have been obliged to import the bulk of our consumption, and all consumers and manufacturers are therefore injured, while foreign manufacturers are benefited by the duty now imposed on the article. Our manufacturers are shut out of all foreign markets by the enhanced price

which the duty of 20 per cent. puts upon their goods. The manufacturers ask only that pig lead should be put in the free list. It is their wish that all articles manufactured from pig lead should remain as at present, under a duty of 20 per cent. The manufacturers of articles from pig lead ask no more than the Secretary of the Treasury has repeatedly suggested in his annual reports—"that the raw materials used in our manufactures should be admitted free of duty." By the tariff of 1857, passed 3d March, the duty on lead manufactures generally was reduced from 30 per cent. to 24; lead in pig and bars from 20 to 15 per cent. Ore from 20 to 15 per cent.

Lead, for sounding. The common hand lead weighs 11 lbs. with about 20 fathoms of line. The leadsman stands somewhere on the side of the vessel, leaning against a band for the purpose; lets the lead descend near the water; then, swinging it over his head once, or twice, if the ship is going fast, throws it forward. The line is marked at 5, 7, 10, 13, 17, and 20 fathoms. The numbers between are called *deeps*: thus, "by the mark 7," "by the deep 9," indicates 7 and 9 fathoms. When the depth is great, the deep-sea lead of 28 lbs. is used. The lead is dropped from the fore part of the vessel, the line being passed outside all. It is generally necessary to heave the ship to. See SOUNDINGS.

League, a measure of length, used in reckoning distances by sea. The sea league is three nautical or geographical miles, or the 1-20th of a degree, and consequently about 3.45 English miles. The common

land league is a well-known itinerary measure on the continent of Europe, chiefly in France. The French, however, have two distinct leagues: the legal posting league (*lieue de poste*), containing 2000 toises, and equal to 2.42 English miles; and a league of 25 to the degree (anciently the *lieue moyenne*), or equal to about 2.76 English miles. This last, however, can scarcely be regarded as a definite measure; and previous to the Revolution the league was different in the different provinces. The word is said to be derived from the Celtic leach, *stone*; the distances having been marked by stones in the Roman provinces. In Gaul alone of those provinces, they were marked in some instances by leagues as well as miles. The Gaulish league was considered by the Romans as equal to a mile and a half of their own measure, or as containing 1500 Roman paces. It is supposed that the league, or *leuca*, was introduced into England by the Normans, where at an early period, it came to be reckoned as an equivalent to 2 miles of the time; this being the sense in which the term *leuca* is used by the oldest law writers, and in most of the old English charters. A league, or 3 miles, is the limit from shore generally allowed for the jurisdiction of a country to extend in fisheries, etc.; and also the limit of neutral water, in which a fugitive ship is safe. See FISHERIES and NEUTRALS. See MILE.

Leak, at sea, is a hole in the ship, through which the water comes in. A ship is said to *spring a leak*, when she begins to leak or let in the water. The manner of stopping a leak is to put into it a plug wrapped in oakum and well tarred, or to insert a tarpauling clout which keeps out the water, or to nail a piece of sheet-lead on the place. Seamen sometimes stop a leak by thrusting a piece of salt beef into it. The sea-water, says Mr. Boyle, being fresher than the brine imbibed by the beef penetrates into its body and causes it to swell so as to bear strongly against the edges of the broken plank, and thereby stops the influx of the water. A ready way to find a leak in a ship is to apply the narrower part of a speaking-trumpet to the ear and the other to the side of the ship where the leak is supposed to be; then the noise of the water rushing in at the leak will be distinctly heard, and thereby discovered.

Leakage, in commerce, an allowance in the customs, granted to importers of wine for the waste and damage the goods are supposed to receive by keeping.

Leather. The skins of various animals, in their fresh state, are flexible, tough, and elastic, and appear to be admirably adapted to the purposes of clothing. But in drying, they become hard and horny, and, on exposure to moisture, putrid. The art of restoring the supple qualities to skins, and rendering them durable, appears to have been discovered at an early period of man's history; and the word *leather*, from the Saxon *lith*, *lithe*, or *lither*, indicates the quality of suppleness. Leather is formed by the chemical union of the *dermis*, *corium*, *cutis*, or true skin of an animal, with an astringent vegetable principle, known as *tannin*, or *tannic acid*. The word *tan*, from the French *tanner*, to *tan*, appears to be derived from the low Latin *tanare*. Leather may, however, be prepared by impregnating the skin with alum, oil, or grease. In the animal hide or skin, the outer part, which is covered with hair or wool, is called the *epidermis* or *cuticle*, below which is the *reticulated tissue*, and then, in contact with the flesh, is the *dermis*, or true skin, which is the only part which admits of being tanned. It varies in thickness in different parts; the mane, the back and the rump, being thicker than the belly. The skin is converted into *gelatin*, or *glue*, by the action of boiling water.

Varieties.—Leather tanned is generally divided into three kinds, namely, *hides*, *kips*, and *skins*; and these yield different varieties of leather, such as *butts* and *backs*, which are made of the stoutest and heaviest ox-hides. When hides are tanned whole for sole leather,

they are called *crop hides*. Skins produce the lighter varieties of leather. Large quantities of hides, dry salted, are imported into the United Kingdom from South America and different parts of Europe, from the Cape of Good Hope, Morocco, etc. Calf skins are imported from the Baltic, and the calves being killed younger than in England, the leather prepared from them is used for book-binding, gloves, and ladies' shoes.

The stoutest leather is made from butts or backs. Buff leather was formerly made from the hide of the buffalo, but it is now furnished by the cow-hide, and is used chiefly for soldiers' belts. Bull-hide is thicker than cow-hide, while that of the bullock is intermediate. Calf-skin supplies the great demand for the upper part of boots and shoes. Sheep-skins form a thin, cheap leather; lamb-skins are used for gloves; goat and kid-skins form a light leather of fine quality; deer and antelope are usually *shamoyed*, or dressed in oil; horse-hide is prepared for harness-work, etc., and this, with seal-skin, is used for making enameled leather; dog-skin makes a thin tough leather, but most of the gloves sold as dog-skin are made of lamb-skin. Hog-skin makes a thin, porous leather, and is used for covering the seats of saddles. There is a large import trade in skins. The great demand for leather for the best gloves is supplied by lamb-skins from Italy, Spain, the south of France, and other parts, where, in consequence of the lamb being killed earlier than with us, the skin is small, fine, and thin, and is used instead of kid; but it is neither so strong nor so glossy. The skin of lambs that die soon after their birth are sometimes dressed with the wool, and are used for lining gloves and shoes. The best kid-skins are from the south of France; they are also imported from Germany, Switzerland, Italy, and Ireland. It is said that as soon as the kid begins to feed on herbage, the skin suffers in fineness and delicacy, and is no longer suitable for the best gloves. The best morocco leather is made from Swiss goat-skins, another kind is from Mogador and East Indian goat-skins, which are often made into black morocco, known as "black Spanish leather," from the circumstance of the first supplies having been obtained from Spain. The leather from the Cape sheep-skin is nearly equal to morocco. Hippopotamus hides are imported from south Africa, and when tanned with oak bark, they make an extremely thick and compact leather.

Tanning Materials.—The vegetable substances used in tanning have of late years become almost as numerous as the varieties of hides and skins on which they are employed. The active vegetable principle, tannin, varies somewhat according to the source from which it is derived; but it is always marked by an astringent taste, a bluish-black, or dark-green precipitate, in aqueous solutions, by admixture with a solution of one of the salts of peroxyd of iron; while, with a solution of gelatin, it gives a dirty white or brown precipitate. A cold aqueous solution of tannin, mixed in certain proportions with one of gelatin in the form of glue, size, or isinglass, forms a substance which is known as *tanno-gelatin*, which may be formed by the application of heat into a viscid elastic mass, resembling India-rubber. By the action of ether, containing a little water, on gall-nuts, pure tannin may be procured. The ethereal solution separates by repose into two layers, the lower one, which is of an amber color, being a solution of tannin in water; while the upper layer contains gallic acid, mixed with other substances. On gently evaporating the aqueous solution, nearly pure tannin is procured, to the extent of from 35 to 40 per cent. from galls. Obtained in this way, it is a shining, porous, uncrystallizable mass; it is soluble in water, and then exerts the properties of an acid. By exposure to air it absorbs oxygen, and gives off a carbonic acid; two new products, gallic acid and ellagic acid, being formed at the expense of the tannin, the latter being insoluble. Tannin may be precipitated from its

solutions by sulphuric and some other acids; by boiling the precipitate with sulphuric acid for a few minutes in a dilute solution of the same acid, gallic acid is formed, and crystallizes in cooling. Gallic acid exists in gall-nuts, sumach, vallonea, tea, and other substances, and probably arises from the decomposition of tannin. It does not combine with gelatin, and is, therefore, useless in tanning. Some tanners, however, imagine the gallic acid of the waste liquor to be useful in swelling or raising the hides, preparatory to removing them to a stronger liquor. It is important to the tanner to understand the circumstances under which tannin is converted into gallic acid; they are numerous and somewhat complicated, and their investigation belongs to the scientific chemist, to whom the manufacturer already owes so many obligations.

During a long period the principal tanning material has been oak bark. That which is stripped in the spring is the most esteemed, for it then contains a larger quantity of tannin than that stripped in autumn, and this more than the bark stripped in winter. The best bark is obtained in a warm spring, from coppice-trees about 12 years of age. Oak bark contains from 5.6 to 6.0 of tannin, which is contained in the inner white layers next the albumen, as in the case of other astringent barks. The tannin of bark is probably not identical with that of galls, as it does not yield pyrogallie acid when subjected to destructive distillation. From four to six pounds of oak bark are required for every pound of leather. After the stripping, the bark is stacked to dry. Should the season be rainy a portion of the tannin may be washed out, and the bark be thus deteriorated. There is no doubt that the peculiar excellence of the sole leather of England is due in great measure to the superior oak bark which is possessed. Oak bark imparts firmness and solidity to leather, while other sorts give softness; thus the peculiar softness of French curried leather is referred to the bark of the evergreen oak, with which the better kinds are tanned, while the other tanning materials next to be named give each its peculiar quality with respect to color, scent, toughness, or the power of resisting moisture and decay.

The other tanning materials, used chiefly for fancy leathers, are as follows:—Sumach, consisting of the young branches and powder of the leaves of *Rhus Coriaria*, *Venus sumach*, or the wild olive, and *Rhus Coriaria*. Sumach varies in its amount of tannin from 16.4 per cent. in Malaga and Sicilian specimens, to 10 and 5 in Virginia and Carolina sumach. The solution is liable to fermentation. *Divi*, or *divi-divi*, is the pod of a South American shrub, *Cospalpinia Coriaria*. The pod is dark-brown, about three inches long, and curled up as if by heat. It is rich in tannin, the whole of which is found in the rind below the epidermis. Vallonea, consisting of the acorn cups of *Quercus Egilops*, or prickly-cupped oak, growing in the Morea. A smaller kind, called *camata*, containing a larger proportion of tannin, is for the most part used by the silk dyers. About two pounds of vallonea are required for making one pound of leather. Vallonea and oak bark may be mixed together with good effect. *Catechu*, *cutch*, *Terra japonica*, or *terra*, are the inspissated aqueous extracts of the bark, wood, and leaves of the *Acacia Catechu*, and *Uncaria gambier*. The two varieties are known in commerce as catechu, or gambier, and cutch; that from Bombay is richer in tannin than that from Bengal. *Myrobalan* is a name given to the fruit of several East India trees; the husk, being the portion valuable to the tanner, is separated by bruising the nut which it incloses. *Mimosa* or *Wattlebark* is furnished by different species of *Mimosa* growing in Australia and New Zealand. *Cork-tree bark* is the inner bark of the cork oak, the outer, or dead bark being the well-known substance, cork. It is obtained from Corsica, Spain, and a few other countries, and contains twice as much tannin as average oak bark. *Larch bark* is sometimes used for tanning sheep-skins,

and *Willow bark* for kid and lamb-skins. The last-named bark is used in making Russia leather, but its peculiar odor is given by means of the oil of birch-tree bark. In addition to the tannin contained in the above substances, there are mucilaginous, coloring and other matters which have an influence on the kind of leather produced. The tannin itself may also vary in different materials; thus catechu and divi give a more porous leather than oak bark or vallonea, while larch bark gives a very inferior leather to that prepared from oak bark. The coloring matter in some excellent tanning materials prevents their use, since it is the custom to sell both upper and sole leathers of a yellowish-fawn color, and any thing which interfered with the production of this tint would be objected to; thus, catechu and cutch would be among the cheapest of tanning materials, were it not that they impart to the leather a reddish-brown color, which would in no way interfere with the dressing or currying.

Grained Leather, which is carried on the hair or grained side, is called *black on the grain*, and is mostly used for the upper leathers of ladies' shoes. In preparing such leather, the waxing is performed as follows: A solution of sulphate of iron, called *copperas-water*, or *iron-liquor*, is applied to the grain side of the wet skin, when the salt, uniting with the gallic acid of the tan,

produces an ink dye; stale urine is then applied to the skin, and when dry, the stuffing is applied. The grain is raised, and when dry the skin is whitened, bruised, and again grained; after which a mixture of oil and tallow applied to the grain side, completes the process.

Varnished and Enameled Leather.—For many years it was found difficult to cause a bright varnish to adhere to leather without cracking, an effect which is now produced by means of boiled linseed oil, mixed

with vegetable black and Prussian blue. This composition, of the consistence of a thick paste, is rubbed upon the surface of the leather, and then dried at a temperature of from 150° to 170° Fahr. The process is repeated from 3 to 7 times, and when quite dry, the varnish adheres very firmly, and will bear considerable flexure and tension without cracking. By mixing colored pigments with the varnish, enameled leather of various colors may be produced.

* There are about 6,000,000 sheep, goat, and other small skins dressed annually which are not included in the above table.

Thin Leather.—The process of tanning differs considerably in the mode of treatment, with the kind of skin, and the result desired. A large number of thin leathers which are intended to be dyed, are tanned in various ways. White leathers are not tanned, but

tawed; or treated with alum, salt, and some other matters. Wash leather is dressed with oil, or shamed. But whatever may be the subsequent treatment, the preparatory steps somewhat resemble each other, whereby hair, wool, grease, and other matters, are

removed, and the skin is reduced to the state of a gelatinous membrane called *pelt*. The hair is removed from kid and goat-skins by means of cream of lime; the wool is generally removed by the fell-mongers before the skin is passed to the tawers. Foreign lamb-skins, which are received with the wool on, are washed, scraped on the flesh side, and sweated in a close room, until, in consequence of the putrefactive fermentation, the wool can be easily removed. After this, fatty

matters are got rid of by subjecting the skins to hydrostatic pressure; they are next worked at the beam, and pared into shape, treated with lime, and next with dogs' or pigeons' dung if the skins are to be tanned, and with bran and water if they are to be tawed, the object being in either case to get rid of the lime. During these operations the skins are worked a few times at the beam, and are finished by washing in clean water.

EXPORTS OF LEATHER AND MANUFACTURES OF LEATHER, FROM THE UNITED STATES, FOR THE YEARS ENDING JUNE 30TH, 1853, 1854, 1855.

Morocco.—Morocco leather is prepared by tanning goat-skins with sumach, and dyeing on the grain side. Inferior moroccoes are prepared from sheep-skins similarly treated, for which purpose each skin of pelt is sewed up into a bag, the grain side outermost, distended with air, and placed in a mordant of tin or alum. They are next placed in a warm cochineal bath for red, indigo for blue, orchil for purple, and are worked by hand until the dye has properly struck. For certain colors the tanning precedes the dyeing. The tanning or sumaching is carried on in a large tub, containing a weak solution of sumach in warm water; another and stronger solution is contained in an adjoining vessel, a portion of which, together with some sumach leaves, is poured into the bag; some of the weak solution is then added, the bag is then distended with air, and the skin thrown into the vat. In this way about 50 skins are treated, and are kept in motion a few hours in the sumach tub by means of paddles worked by hand or by machinery. The skins are then taken out and heaped up on a shelf at the side of the tub, the pressure thus produced causing the liquor to escape slowly through the pores of the skin, the bags being shifted about from time to time. The bags are next passed into a second vat containing a stronger solution, where they remain for 9 hours. The bags are now opened and washed; fine red skins being finished in a bath of saffron. All the skins are next struck on a sloping board until they are smooth and flat, and in order to improve their appearance in the currying, a little linseed oil may be rubbed on the grain side. They are then hung up in a loft to dry, when they become horny, and are in the crust, as it is

called. They next pass through much laborious friction with the pommel, and with a glass-ball; while the peculiar ribbed appearance of morocco is given by means of a ball of box-wood, on which is a number of narrow ridges. Sheep-skin morocco is prepared from split skins; the skin-splitting machine resembles in principle that already described, only as the membrane is thinner certain variations are required. Instead of stretching the skin on a drum, it is passed between two rollers, the lower one of gun-metal, and solid, and the upper made of gun-metal rings; while between the two rollers, and nearly in contact, is the edge of the sharp knife, which is moved by a crank, as already mentioned. When a skin is introduced between the two rollers, it is dragged through against the knife edge and divided, the solid lower roller supporting the membrane, while the upper one, being capable of moving through a small space by means of its rings, adjusts itself to inequalities in the membrane; where this is thin the rings become depressed, and where it is thick they rise up, so that no part escapes the action of the knife. The divided skins are not sewed up into bags, as from their thinness they can be sumached quickly.

In preparing white leather by tawing, the pelt is made as pure as possible; the best kind of leather being prepared from kid-skins, while sheep or lamb-skins make the inferior kinds. They are first fed with alum and salt in a drum or tumbler made like a huge churn; about 3 lbs. of alum, and 4 lbs. of salt being used to 120 skins of medium size. The alumina of the alum probably forms some definite compound with the gelatin of the skins, while the salt serves to whiten them.

When taken out, the skins are washed in water, then allowed to ferment in bran and water, to remove the surplus alum and salt, and to reduce the thickness. They are next dried in a loft, and become tough and brittle, but they are made soft and glossy by means of a dressing of 20 lbs. of wheat flour, and yolks of 8 dozen eggs. By rotating the skins in the drums for some time the dressing is absorbed, and scarcely any thing but water remains. This dressing is usually repeated, and the skins are hung up to dry. The beautiful softness and elasticity of this leather is now given by manipulation. The skins are first dipped in clean water, worked upon a board, and staked upon a stretching, or softening iron, consisting of a rounded iron plate fixed to the top of an upright beam, by which the skins become extended and made smooth. They are finished by being passed over a hot iron.

* Year 1843 is given for nine months only, in consequence of a change in the fiscal year.

† For but six months.

See HIDES, for the imports into, and exports from, the United States, of hides and leather.

Ledger, the principal book of accounts kept by merchants and tradesmen, wherein every person's account is placed by itself, after being extracted from the Journal. For an extended summary of the laws of different countries regulating the keeping of accounts, see LEONE LEVI'S *Commercial Law of the World*.

Lee, an epithet used by seamen to distinguish that part of the hemisphere to which the wind is directed from the other part whence it blows, and which is accordingly called to *windward*. This expression is chiefly used when the wind crosses the line of a ship's course, so that all on one side of her is called to windward, and all on the other side to leeward. Hence, *under the lee*, implies further to the leeward, or further from that part of the horizon whence the wind blows. Under the lee of the shore, means a short distance from the shore which lies to windward. This phrase is commonly understood to express the situation of a vessel anchored, or sailing under the weather-shore, where there is always smoother water and less danger of heavy seas than at a great distance from it. *Lee lurches*, the sudden and violent rolls which a ship often makes to the leeward in a high sea particularly when a large wave strikes her on the weather-side. *Lee side*, all that part of a ship or boat that lies between the mast and the side furthest from the direction of the wind; or, otherwise, that part of a ship which is pressed down toward the water by the effort of the sails, as separated from the other half by a line drawn through the middle of her length. That part of the ship which lies to windward of this line is accordingly called the weather side. Thus, admit a ship to be sailing southward with the wind at east, then is her starboard or right side the lee side, and the larboard or left the weather side.

Leeward Ship, signifies a vessel that falls much to leeward of her course when sailing close-hauled and consequently loses much ground. To leeward, toward that part of the horizon which lies under the lee, or whither the wind blows. Thus, "We saw a fleet under the lee," and "we saw a fleet to leeward," are synonymous expressions.

Lee-way, in navigation, is the deviation of the course actually run by a ship from the course steered upon; or it is the angle formed between the line of the ship's keel and the line which she actually describes through the water. In consequence of the action of the wind or currents, a ship is generally impelled *sideways* as well as forward, whence the direction of her motion is different from that of the keel.

Leeward Islands, a name frequently applied to those of the West India Islands lying between N. lat. 15° and 19°, and W. long. 60° 30' and 65° 40'. The group comprises the British possessions of Antigua, Dominica, Montserrat, Nevis, St. Christopher's, Anguilla, Barouda, and the Virgin Islands, which are all included under one government. The French, Dutch, Danes, etc., have also possessions in the group. There are 23 islands, besides numerous islets, having in all an area of about 1700 square miles, and a population of about 321,000.

Leech-Fishery. The demand for the medicinal leech (*Hirudo medicinalis*) is so great as to afford employment to a considerable number of persons in catching and selling the animal. It is common throughout Europe, America, and India, inhabiting lakes and pools. Norfolk supplies the greater part of the leeches brought to the London market; but some are taken in Kent, Suffolk, Essex, and Wales; and large quantities are imported from Bordeaux and Lisbon. They are caught in spring and autumn by people who wade into the pools and allow them to fasten on their limbs; or more generally the catchers beat, as they wade in the surface of the water with poles, which sets the leeches in motion, and brings them to the surface; when they are taken with the hand, and put into bags. As they come to the surface just before a thunder storm, this is regarded a good time for collecting them.—THOMSON. We extract from the *Gazette des Hôpitaux* the following interesting account of the fishery of leeches at La Brenne, in France:

"The country about La Brenne is, perhaps, the most uninteresting in France. The people are miserable-looking, the

cattle wretched, the fish just as bad—but the leeches are admirable. If ever you pass through La Brenne, you will see a man, pale and straight-haired, with a woollen cap on his head, and his legs and arms naked; he walks along the borders of a marsh, among the spots left dry by the surrounding waters, but particularly wherever the vegetation seems to preserve the subjacent soil undisturbed; this man is a leech-fisher. To see him from a distance—his woe-begone aspect—his hollow eyes—his livid lips—his singular gestures—you would take him for a patient who had left his sick bed in a fit of delirium. If you observe him every now and then raising his legs, and examining them one after the other, you might suppose him a fool; but he is an intelligent leech-fisher. The leeches attach themselves to his legs and feet as he moves among their haunts; he feels their presence from their bite, and gathers them as they cluster about the roots of the bull-rushes and sea-weeds, or beneath the stones covered with green and gluey moss. Some repose on the mud, while others swim about, but so slowly that they are easily gathered with the hand. In a favorable season, it is possible, in the course of three or four hours, to stow ten or twelve dozen of them in the little bag which the gatherer carries on his shoulder. Sometimes you will see the leech-fisher armed with a kind of spear or harpoon; with this he deposits pieces of decayed animal matter in places frequented by the leeches; they soon gather round the prey, and are presently themselves gathered into a little vessel half full of water. Such is the leech-fishery in spring. In summer the leech retires into deep water; and the fishers have then to strip naked, and walk immersed up to the chin. Some of them have little rafts to go upon; these rafts are made of twigs and rushes, and it is no easy matter to propel them among the weeds and aquatic plants. At this season, too, the supply in the pools is scanty; the fisher can only take the few that swim within his reach, or those that get entangled in the structure of his raft. It is a horrid trade, in whatever way it is carried on. The leech-gatherer is constantly more or less in the water, breathing fog and mist and fetid odors from the marsh; he is often attacked with ague, catarrhs, and rheumatism. Some indulge in strong liquors to keep off the noxious influence, but they pay for it in the end by disorders of other kinds. But, with all its forbidding peculiarities, the leech-fishery gives employment to many hands: if it be pernicious, it is also lucrative. Besides supplying all the neighboring *pharmaciens*, great quantities are exported, and there are regular traders engaged for the purpose. Henri Chartier is one of those persons; and an important personage he is when he comes to Meobecq, or its vicinity; his arrival makes quite a fête—all are eager to greet him. Among the interesting particulars which I gathered in La Brenne relative to the leech-trade, I may mention the following: One of the traders—what with his own fishing and that of his children, and what with his acquisitions from the carriers, who sell quantities *second-hand*—was enabled to hoard up 17,500 leeches in the course of a few months; he kept them deposited in a place where, in one night, they all became frozen *en masse*. But the frost does not immediately kill them; they may generally be thawed into life again. They easily, indeed, bear very hard usage. I am told by one of the carriers, that he can pack them as closely as he pleases in the moist sack which he ties behind his saddle; and sometimes he stows his cloak and boots on top of the sack. The trader buys his leeches *pêle mêlé*, big and little, green and black—all the same; but he afterward sorts them for the market. Those are generally accounted the best which are of a green ground, with yellow stripes along the body."

A tract published at Paris in 1845, by M. Joseph Martin, leech-merchant, contains a great variety of curious and instructive details in regard to the natural history of leeches, the trade carried on in them, and the frauds of the dealers. They are, we believe, much more extensively used in medical practice in France than in England; and, at all events, their consumption in the former seems to be quite immense. Notwithstanding the exhaustion of some of the marshes and ponds in different parts of the country, whence supplies of leeches were formerly procured, great numbers are still obtained at home. By far the larger portion of the necessary supplies is, however, brought from abroad; principally from Germany, Spain, Sardinia, Turkey in Europe, Algiers, Asia Minor, etc. In the French custom-house the imports are estimated at 500 leeches per kilog.; but M. Martin affirms that 1000 leeches do not, at an average, weigh more than a kilog. Hence the numbers and values of the leeches imported

into France during each of the five years ending with 1847, will be:

Years.	Numbers, according to official Returns.	Numbers corrected.	Official Value, Francs.
1843	17,607,696	85,215,892	528,281
1844	15,232,673	80,465,346	456,980

1846	12,721,545	26,448,090	381,647
1847	11,790,840	23,581,680	358,710

See DE BOW'S *Rev.*, xiii., 80.

Leghorn, a city and sea-port of Italy, in Tuscany, lat. 43° 33' 6" N., long. 10° 16' 45" E. Population, in 1851, 84,000. Leghorn has an outer harbor, protected by a fine mole, running in a north north-west direction upward of half a mile into the sea, and a small inner harbor or basin. The water in the harbor is rather shallow, varying from 8 feet in the inner basin to 18 or 19 feet at the end of the mole. The rise of the tides is about 14 inches. Ships lie within the mole with their sterns made fast to it by a cable, and an anchor out ahead. The light-house is built on a rock a little to the south-west of the mole. It is a conspicuous object, being about 170 feet above the level of the sea. The roadstead lies west north-west of the harbor, between it and the Melora bank. The latter is sandy, lying north and south, 4 miles in length by 2 in breadth, the side nearest the shore being about 4 miles from it. It consists, for the most part, of sand and mud, and has from 8 to 8½ fathoms water over it; but toward its southern extremity it is rocky; and there, on some of the points which project above the water, the Melora tower has been constructed to serve as a sea-mark; it bears from the light-house west one half north, distant about 4 miles. The best course for entering the roads is to keep to the northward of the Melora bank at about a mile from it, and then, having doubled it, to stand on for the light-house about 2½ miles, anchoring in from 7 to 9 fathoms, the light-house bearing south south-east one half east 4 miles off. The entrance by the channel to the south of the Melora bank is also quite safe; but it is not so suitable for large ships as that by the north. During southerly winds there is sometimes a heavy sea in the roads, but the holding-ground is good; and with sufficient anchors and cables, and ordinary precaution, there is no danger. The lazaretto lies to the south, about one mile from the tower, and is said to be one of the best in Europe.

Trade, &c.—The comparative security and freedom which foreigners have long enjoyed in Tuscany, still more than its advantageous situation, render Leghorn the greatest commercial city of Italy. Its exports are similar to those from the other Italian ports; consisting principally of raw and manufactured silks, olive oil, borax, fruits, shumac, valonia, wines, rags, brimstone, cheese, marble, argol, anchovies, manna, juniper berries, hemp, skins, cork, etc. Leghorn platting for straw hats is the finest in the world; and large quantities are imported into Britain. See HATS, STRAW. Besides the above, all sorts of articles, the produce of the Levant, may be had at Leghorn. Recently, however, this trade has fallen off; the English and other nations who used to import Levant produce at second hand from Italy, preferring now, at least for the most part, to bring it direct from Smyrna, Alexandria, etc. The imports are exceedingly numerous and valuable, comprising all sorts of commodities, with the exception of those produced by Italy. Sugar, coffee, and all sorts of colonial produce; cotton stuffs, yarn, and wool; corn, woollen stuffs, spices, dried fish, indigo, dye-woods, rice, iron, tin, hides, etc.; are among the most prominent articles. Ships with corn on board may unload within the limits of the lazaretto, without being detained to perform quarantine; a circumstance which has contributed to make Leghorn one of the principal *dépôts* for the wheat of the Black Sea. Hard wheat, particularly from Taganrog, is in high estimation here and in the other Italian ports. It is particularly well

fitted for making vermicelli, macaroni, etc. The government do not publish any official account of the imports of Leghorn; and no mercantile circulars that we have been fortunate enough to fall in with supply the deficiency.

Money.—Down to 1837 accounts were principally kept in *pezze da otto reali* (or dollars of 8 reali), the pezza being divided into 20 soli or 240 denari; but this money has been discontinued since the above date, and accounts are now kept in *lire Toscana*. The lire of 100 centesimi is worth 7·82d.; so that the par of exchange with London is 30·69 lire per £1. The lire is divided in 20 soldi di lira each of 5 centesimi.—TATE'S *Cam-bist*, p. 37.

Weights and Measures.—The pound by which gold and silver and all sorts of merchandise are weighed is divided into 12 ounces, 96 drachms, 288 denari, and 6912 grani. It is = 339·542 French grammes, or 5240 English grains. Hence 100 lbs. of Leghorn = 74·864 lbs. avoirdupois; but in mercantile calculations it is usual to reckon 100 lbs. of Leghorn = 77 lbs. avoirdupois: this, perhaps, has arisen from taking the tares and other allowances, as to which there is a good deal of uncertainty, into account. Thus it is found that the English cwt. seldom renders more than 140 or 142 lbs. at Leghorn, though it is = 150 lbs.; in the instances of logwood, tobacco, and a few others, it does not render more than 135 lbs. The quintal, or centinago = 100 lbs. The centaro is generally 150 lbs.; but a centaro of sugar = 151 lbs.; that of oil = 88 lbs.; of brandy = 120 lbs.; of stock-fish, and some other articles = 160 lbs. The rotolo = 3 lbs. Corn is sold by the sacco or sack = 2·0739 Winch. bushels; hence 4 sacks = 1 imperial quarter, very nearly. The liquid measures are:

2 Mezzette = 1 Boccale.
2 Boccale = 1 Fiasco.
20 Fiaschi = 1 Barile = 12 English wine gallons.

The barile of oil is 16 fiaschi, of two boccali each = 8·83 wine gallons; it weighs about 66 lbs. avoirdupois. A large jar of oil contains 30 gallons; a small one 15; and a box with 30 bottles = 4 gallons.

The long measure is the braccio, which is divided into 20 soldi, 60 quattrini, or 240 denari; it contains 22·98 English inches. 155 bracci = 100 English yards. The canna of 4 bracci = 92 English inches.

Credit, Charges, etc.—Goods in general are bought and sold for silver money; between which, and the money in which bills of exchange are bought, there is a difference of 7 per cent. (agio) against silver; i. e., \$107 in silver are equal to \$100 in gold. On goods bought or sold (unless it be in effective money, where there is no discount) there is, generally speaking, a discount of 3 per cent.; on all cotton manufactures, 4 per cent. Charges on sales, including commission, are generally from 6 to 8 per cent.; on fish, 8 or 10 per cent. **Tares.**—Cinnamon lb. 12 to 14 per half bale; Mocha coffee, 5 to 7 per cent.; indigo seroons, lb. 20, 30 to 40 per seroon; sugar Havana, 14 per cent.; crushed, 42 per cent. or real tare of package; loaf package, and 4 per cent. for paper; Brazil of 19 inches, 18 per cent. upward 20 per cent.; tobacco, 10 per cent.; rosin, 12 per cent. For most other articles specified in the price current the real tare is allowed. **Exchanges, Three Months' Date.**—London, liv. @ per £ stg.; Spanish dollars, £6 11s.; Paris, liv. @ per 100 francs; doubloons, £101; Genoa, liv. @ per 100 Ln.; Trieste, liv. @ per 100 C. Flor.

In 1836 a joint-stock bank was established in Leghorn, with a capital of 2,000,000 lire (£66,666 sterling, taking the lire at 8d.) in shares of 1000 lire each. The whole of the capital is paid up, and the responsibility is limited to the capital. The managers have the power of issuing promissory notes to the extent of 6,000,000 lire. These notes, though received by the government, are not legal tender. The operations of the bank are confined to the discounting bills of ex-

change not having more than four months to run, and to the purchase and sale of foreign coins. The rate of discount is fixed at 5 per cent. The superintendence is vested in a director and eight regents, nominated by the shareholders; and the government appoints a commissary and three censors (from among the shareholders), who exercise the highest authority, to secure obedience to the statutes. An annual report and balance-sheet is produced, and is accessible to all shareholders. The maximum amount for which notes are issued is 2000 lire = £66 13s. 4d. sterling; the lowest, 200 lire = £6 13s. 4d. sterling. It is a profitable establishment; its shares are at a considerable premium, and it has every prospect of success.

IMPORTS OF THE LEADING ARTICLES INTO LEGHORN, DURING THE YEARS 1850, 1851, 1852.

Leipsic, or more correctly Leipzig, one of the four circles into which Saxony is divided, comprises the north-west part of that kingdom, and is bounded on the north and west by Prussia, south by Saxe-Altenburg and the circle of Zwickau, and east by the circle of Dresden. Area, 1336 square miles. The country is generally level, and lies lower than any other part of Saxony. It is most elevated in the south, where some offsets of the Erzgebirge appear, but do not attain any great height. Leipsic belongs to the basin of the Elbe, and is principally drained by its tributaries the Elster and Mulda. The soil is fertile, and in general well cultivated. The principal crop is corn. The rearing of cattle, and especially of sheep of a superior breed, is much attended to. Tobacco is extensively grown. There are no metals; but limestone, marble, potters' clay, fullers' earth, and peat are abundant in various parts. The manufactures in this circle are flourishing, and include woolen, cotton, and linen goods, and earthenware. Population (1855) 454,262.

Leipsic, or Leipzig, the capital of the above circle, and the second city in the kingdom, is situate on an extensive and fertile plain, on the White Elster, here joined by the Pleisse and Parde, 72 miles W.N.W. of Dresden by railway. The fortifications which formerly surrounded the town have been converted into beautiful walks and gardens. The houses are chiefly old-fashioned stately buildings, frequently six stories in height, besides three or four additional ones in the pyramidal roof, and exhibiting much carved masonry. The streets are narrow, and from the height of the houses, have rather a dingy appearance, but are well

paved and clean. The suburbs, however, of which there are four, are of recent date, and more regularly built.

Leipsic is connected by railways with Dresden, Magdeburg, Berlin, and Altenburg, and is the centre of a very extensive trade. The celebrated Leipsic fairs are held thrice a year—on the 1st of January, at Easter, and at Michaelmas. They usually last for three weeks, and are attended by merchants from all parts of Germany, England, France, America, Russia, Italy, Greece, Turkey, Persia, etc. The goods comprise all kinds of woollen, linen, and cotton stuffs, silks, lace, hardware, jewelry, watches, toys, paper, books, leather, etc. The value of the goods brought to these fairs in 1855 was estimated at about \$55,000,000. On these occasions the town presents the greatest bustle and confusion; the streets and squares are occupied by temporary booths, in addition to the ordinary shops, while the population of the town is nearly doubled. The Easter and Michaelmas fairs, particularly the former, are famous for the vast number of new publications brought there for sale. The Easter fair is attended by booksellers from all parts of Germany, and even from other countries, sometimes to the number of 600. Prospectuses and specimens of new publications are brought here for circulation, annual accounts are settled, and purchases made. In the Easter fair catalogue for 1856 the number of new works announced as published in Germany during the preceding year was 9540, as forthcoming, 1171. Leipsic is also of considerable importance as a manufacturing town. It has large type-foundries, oil-mills, paper-mills, and manufactories of silken goods, stockings, leather, hats, hardware, musical, optical, and mathematical instruments. There are about 150 publishing establishments in the town; and in 1853 there were 36 printing-offices, with 58 steam, and 164 hand presses. Leipsic was the scene of a tremendous conflict on the 16th, 17th, and 18th of October, 1813, between the allies under Prince Schwartzenberg, and the French, under Napoleon, in which the latter were totally defeated. See HISTORY OF FRANCE. Population (1855), 69,986.—E. B.

Leith, although an independent burgh, may be considered the sea-port of Edinburgh, from which it is only about a mile and a half distant. The Water of Leith, at its confluence with the Firth of Forth, divides the town into two parts, called, respectively, North and South Leith. The first mention made of Leith is in the charter of erection of Holyrood Abbey, founded by David I. in 1128, where it is styled Inverleith. The magistrates of Edinburgh obtained a grant of the harbor and mills from Robert I. in 1329, and they subsequently purchased, from Logan of Restalrig, all the other rights and privileges.

The chief manufactures of Leith are ropes, sailcloth, locomotive engines and machinery, glass, soap, ale, refined sugar, and oil-seed cakes. Iron and timber ship-building is also carried on to a considerable extent. Various efforts have from time to time been made to overcome the natural obstacles that lay in the way of Leith as a shipping port. In 1720 a dock was formed on the east side of the river, and in 1777 a small quay called the custom-house quay was built. Between 1800 and 1817, two wet docks were constructed, each measuring 750 feet in length by 300 in width, and having a united area of about 10 acres. In 1831 two great additional works were undertaken, viz., an addition to the old or east pier of 500 yards, and the formation of a covering bulwark, by means of which the water in the channel was deepened about two feet. There were still, however, only 17 feet of water over the bar at its mouth at high-water spring tides, and no vessel of above 400 tons could enter the harbor without lightening. Further improvements were commenced in 1848, and completed in 1855. These included the formation of the Victoria Dock,

equal in extent to either of the others; the new western pier and low-water landing slip; the extension of the eastern pier 1000 feet seaward. The length of the east pier is now 3530 feet, and of the west, 3123 feet. They are unsurpassed by any in the kingdom; and, in addition to other important purposes, afford the means of a healthful and pleasant promenade. By means of these improvements, a depth of 26 feet water has been obtained in the new harbor at high-water spring, and of 21 feet at neap, tides. The Victoria Dock has 25 feet water at spring, and 20 feet at neap, tides, upon the gate sill, and two feet more within the dock; and the two old docks have 18 feet at spring, and 13 feet at neap, tides. Vessels of upward of 2000 tons burden, of 320 feet in length, and 58 feet in breadth, can be accommodated in the Victoria Dock. There are also five dry or graving docks at Leith, of the following dimensions:

No. of docks.	Length.		Width.			Depth of water over dock sills at high-water spring tides.
	Of floor.	At top.	Of floor.	At top.	Of gates.	
1	ft. in.	ft. in.	ft. in.	ft. in.	ft. in.	ft. in.
1	160 0	174 0	45 0	70 6	36 0	16 6
1	173 0	177 0	32 0	58 0	36 0	18 8
1	166 0	172 0	36 9	49 6	30 9	12 5
1	117 6	121 6	41 0	51 0	33 9	12 6

A new graving dock of greater capacity is proposed to be made on the east sands, and to enter the present new harbor a little to the north of the entrance to Victoria Dock. The following are its proposed dimensions: length of floor, 300 feet, at top, 330 feet; width of floor, 45 feet, at top, 80 feet; of caisson, 72 feet; depth of water over sills at high-water springs, 24 feet 5 inches. Besides having regular steam communication with Rotterdam, Hamburg, Hull, London, Newcastle, and the north of Scotland, Leith trades largely with the Baltic, Mediterranean, North America, and Australia. The exports are principally coal, iron, spirits, ale, paper, linen yarn, etc. Of coal and iron the quantities exported during the last three years were as follows:

	EXPORTS.		
	Coals.	Pig-iron.	Malleable iron.
	Tons.	Tons.	Tons.
To May 15th, 1854....	29,773	24,072	2,008
" 1855....	35,098	33,094	1,196
" 1856....	30,898	29,220	2,352

The principal import is grain, of which the quantity imported during the last three years is given in the following table. After grain and timber, the chief articles of import are hemp, flax, wool, linseed, oil-cakes, guano, agricultural seeds, butter, cheese, fruit, corkwood, wines, spirits, oil, sugar, tea, etc.

Years ending May 15th.	Wheat.	Flour.	Timber from	
			Baltic and other ports.	North America.

NUMBER AND TONNAGE OF VESSELS SAILING FROM LEITH, FOR THE YEARS ENDING MAY 15TH, 1854, 1855, 1856.

Years.	British sailing vessels.		British steam vessels.		Foreign vessels.		Total.	
	No.	Tons.	No.	Tons.	No.	Tons.	No.	Tons.
1854	3,410	191,200	630	87,504	842	85,213	4,882	364,022
1855	3,316	194,284	625	85,899	778	78,486	4,719	353,669
1856	3,303	195,227	623	87,668	842	88,585	4,778	371,475

The amount of customs duties received at Leith for the last four years were: 1853, £485,915; 1854,

£455,403; 1855, £462,917; and 1856, £498,172. The vessels registered as belonging to the port on 31st December, 1855, were: sailing vessels, of and under 50 tons, 71; tonnage, 2218; above 50 tons, 80; tonnage, 17,058; steam vessels of and under 50 tons, 14; tonnage, 289; above 50 tons, 28; tonnage, 6654. The recent war with Russia has checked the increase in the trade that would otherwise have resulted from the greatly enlarged accommodation.—E. B.

Lemons (Ger. *Limonen*; Du. *Limoenen*; Fr. *Lemons*, *Citrons*; It. *Limoni*; Sp. *Límones*; Port. *Limões*; Rus. *Limón*; Arab. *Lēmōn*), the fruit of the lemon tree (*Citrus medica*, var. β , C.). It is a native of Assyria and Persia, whence it was brought into Europe: first to Greece, and afterward to Italy. It is now cultivated in Spain, Portugal, and France, and is not uncommon in our 'green-houses.' Lemons are brought to England from Spain, Portugal, and the Azores, packed in chests, each lemon being separately rolled in paper. The Spanish lemons are most esteemed. Like most of its tribe, the lemon produces under cultivation a great number of varieties. Several are known in commerce. The principal are: the Wax Lemon (*Citrus Limonium cerascum* of Risso); this is the smooth-peeled one, most generally found in the markets; its rind is thick. The Bignette Lemon (*Citrus Limonium Bignetta* of Risso) is a thinner-peeled fruit than the wax lemon, less oval in shape, and more blunt at the point; the color of the rind is less clear, and is usually tinged with green. It is cultivated more largely than any other variety, as it yields a larger quantity of juice, and is a most abundant bearer. The Clustered Lemon (*Citrus Limonium racemosum* of Risso) is the least oval of the imported lemons, but the nipple-like point is fully developed. The rind is thick, and has a bright yellow color. The pulp is less agreeable than the varieties previously mentioned. One or two other varieties, as the imperial and Gaeta lemons, are occasionally brought to this country, but not in any considerable quantities.

Lemon Juice, or Citric Acid (Ger. *Zitronensaft*; Fr. *Jus de limon*; It. *Agro o Sugo de limone*; Sp. *Jugo de limon*), the liquor contained in the lemon. It may be preserved in bottles for a considerable time by covering it with a thin stratum of oil: thus secured, great quantities of the juice are exported from Italy to different parts of the world; from Turkey, also, where abundance of lemons are grown, it is a considerable article of export, particularly to Odessa. The discovery of the antiscorbutic influence of lemon juice is one of the most valuable that has ever been made. The scurvy, formerly so fatal in ships making long voyages, is now almost wholly unknown: a result that is entirely to be ascribed to the regular allowance of lemon juice served out to the men. The juice is also frequently administered as a medicine, and is extensively used in the manufacture of punch.

Lemon Peel (Ger. *Zitronenschalen*, *Limonschellen*; Fr. *Lames d'écorce de citron*; It. *Scorza de limone*; Sp. *Corteza de citra*). The outward rind of lemons is warm, aromatic, and slightly bitter—qualities depending on the essential oil it contains. It is turned to many uses, and, when well candied, constitutes a very good preserve. In Barbadoes, a *liqueur*, known under the name of *Eau de Barbade*, is manufactured from lemon peel, which the inhabitants have the art of preserving in a manner peculiar to themselves. Both the liqueur and the conserve used to be in high repute, especially in France.

Lending-houses. That it should have once been conceived unlawful to exact interest for the loan of money, will not appear surprising when it is considered that at an early period the occupations by which a man could support his family were neither so numerous nor so productive as in modern times. As money, therefore, was at that time sought to remove immediate necessity, those who advanced it were influenced

by benevolence and friendship. But on the extension of trade, arts, and manufactures, money lent produced much more than what was adequate to the borrower's daily support, and therefore the lender might reasonably expect from him some remuneration. To the lending of money upon interest, according to the earliest accounts, succeeded the practice of establishing funds for the relief of the needy, on condition that they could deposit any thing equal in value to double the sum borrowed, for which they were to pay no interest. But, as upon the one hand, the idea of exacting interest for the loan of money was odious to the members of the Catholic church in general, while, on the other, it appeared proper, and even necessary, to pay interest for money to be employed in commerce, the pontiffs themselves at length allowed the lending-houses to take a moderate interest; and, in order not to alarm the prejudices of those to whom the measure was obnoxious, it was concealed under the name of being paid *pro indemnitate*, the expression made use of in the papal bull.

It appears that lending-houses, which gave money on receipt of pledges at a certain interest, are by no means of recent date; for many houses of this description, in Italy at least, were established in the 15th century, by Marcus Bononiensis, Michel a Carcano, Cherubinus Spoletanus, Antonius Vercellensis, Bernardinus Tomitano and others. The lending-house at Perugia established by Barnabas Interamensis was inspected in 1485 by Bernardinus, who augmented its capital, and in the same year established one at Assisi, which was confirmed by Pope Innocent, and visited and improved by its founder in the year 1487. He likewise established one at Mantua after formidable opposition, having procured for it the sanction of the Pope. The same person also founded lending-houses at Florence, Parma, Chieli, and Piacenza, in doing which he was sometimes well received, while at others he frequently met with great opposition. A house of this kind was established at Padua in the year 1491, and another at Ravenna, which were approved of and confirmed by Pope Alexander VI.

Long after the period here referred to, lending-houses were established at Rome and Naples; that of the former city having been opened in 1539, and that of the latter probably in the following year. A lending-house was established at Nuremberg, in Germany, about 1618, the inhabitants having obtained from Italy the regulations of different houses in order to select the best. In France, England, and the Netherlands, lending-houses were first known under the denomination of lombards. Similar institutions were formed at Brussels in 1619, at Antwerp in 1620, and at Ghent in 1622. Although such houses must be allowed to be of very considerable utility under certain circumstances, especially when interest is not allowed to be exorbitant, yet they were always odious in France. One was, however, established at Paris in 1626 in the reign of Louis XIII., which the managers next year were obliged to abandon. The *mont de piété* in that city, which has sometimes had in its possession forty casks full of gold watches which had been pledged, was established by royal authority in the year 1777, as we learn from the *Tableau de Paris*, published at Hamburg in the year 1781.—E. A.

Lengthening, in ship-building, the operation of cutting a ship down across the middle and adding a certain portion to her length. It is performed by sawing her planks asunder in different places of her length on each side of the midship frame to prevent her from being too much weakened in one place. The two ends are then drawn apart to a limited distance, which must be equal to the proposed addition of length. An intermediate piece of timber is next added to the keel, upon which a sufficient number of timbers are erected to fill up the vacancy produced by the separation. The two parts of the keelson are afterward united by an ad-

ditional piece, which is scored down upon the floor timbers, and as many beams as may be necessary are fixed across the ship in the new interval. Finally, the planks of the side are prolonged so as to unite with each other, and those of the ceiling are refitted in the same manner, by which the whole process is completed.

Lentil, the seeds of *Errum lens* (natural order *Leguminosæ*). The lentil is closely allied to the tare, and is probably the most ancient of all the food products which man derives from the pea-tribe. The *red potage* in Gen. xxv. 34, is the small lentil decorticated, as it is sold at the present day in the bazaars of India. Pliny mentions two kinds of lentils grown in Egypt, one rounder and blacker than the other. These were, probably, only varieties resulting from cultivation. Three such are cultivated in France, where, as in most Roman Catholic countries, this kind of pulse is extensively used during Lent; to which season, as some suppose, it gives its name. The lentil is a native of Europe, Asia, and northern Africa; or, at all events, it is naturalized in those parts of the world. It is cultivated occasionally in some parts of England, but chiefly as a fodder plant. The ripe seeds are very nutritious, and contain a large proportion of gluten. They are frequently imported from Alexandria for cattle-feeding; while, for culinary purposes, the larger and lighter-colored varieties are imported from France and Germany, where considerable attention is paid to their cultivation and harvesting. In Egypt the lentil forms a large proportion of the general food of the inhabitants, and the haulm is used for packing purposes. The empirical preparation called *Revalenta Arabica*, has been proved to be nothing but the meal of decorticated lentils; a food by no means well adapted to all constitutions, especially those of infants. The quantity of starch in the lentil is very considerable; and, in addition to the gluten, renders this pulse one of the most nutritive of vegetable food products. Lentils are, however, heating if used much. The starch, according to Einhoff, is nearly one third its weight.

Letters of Credit. A letter of credit is an open letter of request, whereby one person requests some

other person or persons to advance money or to give credit to a third person, named therein, for a certain amount, and promises that he will repay the same to the person advancing the same, or accept bills drawn upon himself for the like amount. It is called a general letter of credit when it is addressed to all merchants, or other persons in general, requesting such advance to a third person, and a special letter of credit when it is addressed to a particular person by name, requesting him to make such advance to a third person. If the letter of credit be of the latter sort, there does not seem to be any doubt that it is an available promise in favor of the person to whom it is addressed, and who makes the advance upon the faith thereof. But if the letter of credit be general, it is a matter of some doubt whether the writer is bound to the person making advance upon the strength of the letter. The question does not appear to have been ever decided in England, but it has several times been thoroughly discussed in the Supreme Court of the United States (*Laurason vs. Mason*, 3 Cranch, 492; *Adams vs. Jones*, 12 Peters, 207). The doctrine was maintained in these cases that the letter writer is bound positively and directly to any party making the advance upon the faith of the letter, not only where the letter purports, on its face, to be addressed generally to any person or persons whatsoever who should make the advance, but also in cases where the letter is addressed solely to the person to whom the advance is to be made, and merely states that the person signing the same will become his surety for a certain amount, without naming any person to whom he will become security, if it is obviously to be used to procure credit from some third person, and the advance is made upon the faith of the letter by such third person.

Formerly, and up to the years 1825—1830, remittances to India and China, for importations into the United States, were made almost exclusively in Spanish dollars. After that period letters of credit were liberally issued by the Bank of the United States, on their European correspondents, in favor of American merchants. This mode of remittance is made universally from the United States.

FORMS OF LETTERS OF CREDIT, AS USED IN NEW YORK, AND AS ISSUED BY THE WESTERN BANK OF SCOTLAND, FOR REMITTANCES TO INDIA, ETC.

No. 130. 2300 Sterling. For First of Exchange. New York, 7th June, 1842.
To Geo. D. Carter, eastward of the Cape of Good Hope, or holder hereof. We are duly authorized by Messrs. Palmers, Mackillop, Dent, & Co., London, to engage on their behalf that they will accept the first presented bill of this set of Exchange at Six Months' sight, provided this Certificate be presented therewith and delivered to Messrs. Palmers, Mackillop, Dent, & Co., on their acceptance. On behalf of Palmers, Mackillop, Dent, & Co.

DAVIS, BROOKS & CO. FIRST.

No. 130.

Exchange for £300 Sterling.

2385

R. S. & Co.

Six Months after sight of this First of Exchange (Second and Third unpaid) pay to the order of Davis, Brooks, & Co. Three Hundred Pounds Sterling, value received, as advised by

Your obedient servant,

GEO. D. CARTER.*

To

Messrs. Palmers, Mackillop, Dent, & Co.,
London.

* The bill is indorsed, "Pay George D. Carter, or order.—Davis, Brooks, & Co.

New York, 7th June, 1842.

No. £
FOR FIRST OF EXCHANGE.
WESTERN BANK OF SCOTLAND.

To
I hereby engage to accept, and to pay at Maturity, the first presented Bill of the set of Exchange, of which the annexed is the First, to be drawn by on the Western Bank of Scotland, on or before

at Sixty Days' Sight, provided this Letter of Credit, as annexed to such Bill, be presented therewith and delivered to me on acceptance thereof. For the Western Bank of Scotland, Manager.

BY THE WESTERN BANK OF SCOTLAND.

No. £ 1851.

Sixty days after sight, pay this First of Exchange (Second and Third of same tenor and date unpaid), to the order of at Messrs. Jones, Lloyd, & Co.'s, London, value received as advised.

To the
Western Bank of Scotland,
Glasgow.

BY THE CLYDESDALE BANK.

THIRD OF EXCHANGE.

£ CLYDESDALE BANK, GLASGOW.

To
We hereby engage to accept and to pay at maturity, the first presented Bill of the set of Exchange, of which the annexed is the Third, to be drawn by you on us, on or before the
for £ say
Sterling, payable in London at a date not less than and not exceeding
days' sight, provided this Letter of Credit be delivered to us on acceptance of the annexed Bill. For the Clydesdale Banking Company.

No.

£ 1851.

after sight, pay this Third of Exchange

(First and Second of the same tenor and date unpaid), to the

Order of

in London

Value received as advised

Sterling.

To

In New York it has been held (Hill's Rep., vol. v., 634) that letters of credit and commercial guaranties are not negotiable instruments. In Campbell's Rep., iv., 393, it was decided that a letter of credit, addressed to any person who should make an advance upon the faith of the letter, is an available promise in favor of the person making the advance; and it is considered as available if it be a general letter of credit, in favor of any person who makes the advancement the faith of it. See articles BANKS, BILLS OF EXCHANGE, and EXCHANGE.

Levant, a name derived from the Italian word for the south-east, and applied in the middle ages to that quarter of the Mediterranean east of Cape Matapan, now generally applied to the coasts of Asia Minor, Syria, etc. *Levant*, in *geography*, signifies any country to the eastward of us, or in the eastern part of any continent or country, or in that quarter where the sun rises.

Levee, an embankment on the margin of a river to confine it within its natural channel. The lower part of Louisiana, which has been formed by encroachments upon the sea, is subjected to be inundated by the Mississippi and its various branches for a distance of more than 300 miles. In order to protect the rich lands on these rivers, mounds are thrown up of clay, cypress-logs, and green turf, sometimes to the height of 15 feet, with a breadth of 30 feet at the base. These, in the language of that part of the country, are called *levees*. They extend for hundreds of miles; and when the rivers are full, cultivated fields covered with rich crops, and studded with villages, are seen several feet below the river courses. The giving way of these levees, sometimes occasioned by a sudden and violent pressure of the water, and sometimes by accidental perforations, is called a *crevasse*; French, a disruption.

Lew-Chew Islands. See LOO-CHOO ISLANDS.

Liberia, an independent Negro republic of west Africa, established 1823, extends along the coast of Guinea, between Sierra Leone and Cape Mensurado, from the Shebar River on the north, to the Garaway on the south, a distance of 350 miles, with an average breadth of 80 miles. Population 1850, 250,000, of whom 10,000 are free blacks from the United States, and the remainder aborigines, or captives released from slavers. The country has been all purchased from time to time by the American Colonization Society, and its climate has improved greatly by a systematic drainage, and clearance of woods. It is estimated that 2,000,000 inhabitants of the interior now obtain supplies of European goods from this republic and Cape Palmas. Liberia, formerly a dependency of the United States of America, was recognized as an independent republic in July, 1848. Government vested in a president, vice-president, and a senate of 6 members, and a house of representatives of 28 members, elected by all possessors of a real estate to the value of \$30. About 50,000 of the population are said to use the English language, and children are sent from the surrounding countries, 400 or 500 miles distant, to attend the schools of this State, which also supports two public journals. The sea-port and capital, Monrovia, has a population of 9,000.

The treaty concluded in 1852 between France and the republic of Liberia was finally ratified in the year 1856. The independence of the republic was recognized successively by the United States, England, Belgium, Prussia, and Brazil, from 1847 to 1854. To this list France has at last added her name by the late treaty. The original colony of Liberia was founded by the American Colonization Society, under the direction of its first President, Mr. Finley. It is situated at the northern extremity of the coast of Guinea, and is about 370 miles in length. Its capital, Monrovia, is on the former site of the principal slave-market on this part of the African coast, and stands as a living protest against the slave-trade, in the abolition of which the colony has been largely instrumental. In February, 1820, the first ship-load of emigrants left New York for the coast of Guinea. They were 80 in number—forming 25 families—under the care of 3 citizens of the United States, a clergyman, a lawyer, and a physician. In 1847 Liberia emerged from its dependent colonial condition, and became an independent State. In 1854 it contained a population of about 12,000 black colonists, chiefly Americans, and from 140,000 to 150,000 natives, whose social and religious condition is far in advance of that of their blood-thirsty and idolatrous ancestors.

The capital is now a flourishing maritime city, having a fort, a light-house, a commercial market, a small marine, and schools, churches, newspapers, charitable associations, and other institutions similar to those in the United States. The 6th article of the constitution of the republic declares that, inasmuch as the essential object of its foundation was to open an asylum for the scattered and oppressed children of Africa, and, at the same time, to regenerate the people of the vast continent of Africa, yet enveloped in the darkness of ignorance, none but persons of color will be allowed to become citizens of the republic.

The exports of Liberia, consisting chiefly of palm-oil, logwood, and other dye-woods, which are transported to England and the United States, amount to about \$1,000,000 annually. Besides all the usual tropical productions, it produces Indian corn, rice, the potato, sugar, coffee, and cotton. Gold is also found in considerable quantities. The cotton of Liberia, which has been highly approved in the Manchester market, has lately attracted much attention, and its probable successful cultivation promises to exert a most important influence on the future of the republic. A communication from a highly respectable and reliable source recently appeared in the *National Intelligencer*, the writer of which gave a decided preference to the cotton of Liberia over that of Brazil, in point of quality, cheapness of production, and facility of transportation to market. The subject deserves further and full investigation. Considered simply as an experiment in practical benevolence, Liberia deserves and will receive the protection of the great powers of the world. Whether or not it be destined, as some have thought, to work out the solution of the vexed question of slavery in the United States, it will yet gain the great glory of redeeming from barbarism and idolatry many millions of the human race.

Trade is the chosen employment of the great mass

of the Liberians, and some of them have been decidedly successful in this vocation. It consists in the exchange of articles of American or European manufacture for the natural products of the country, of which palm-oil, cam-wood, and ivory, are the principal articles. Cam-wood is a rich dye-wood, and it is brought to Monrovia on the shoulders of the natives from a great distance. It is worth, in the European and American markets, from \$60 to \$80 per ton. The ivory of this region does not form an important item of commerce. The Liberian merchants own a number of small vessels, built by themselves, and varying in size from 10 or 15 to 40 or 50 tons. These are navigated by the Liberian sailors, and are constantly engaged in bringing palm-oil to Monrovia, from whence it is again shipped in foreign vessels for Liverpool or New York.

Under the general name of Liberia are comprehended the territories of the republic and of the Maryland colony, founded at Cape Palmas. The political jurisdiction of the republic extends from Shebar, a point immediately north of Gallenas, to Grand Sesters, giving a coast frontier of 350 miles, or, including the Maryland colony, of 470 miles, running into the interior an average of 40 miles; the whole territory embracing an area of upward of 14,000 square miles. The jurisdiction of the Maryland colony extends from Grand Sesters to the River San Pedro, opening a coast frontier of 120 miles. These territories have, of late years, been considerably extended by means of purchase, the most important addition being the annexation of Gallenas, formerly the point at which the slave-trade was most extensively conducted. The New Jersey Colonization Society, established in 1825, is said to have recently purchased from the natives 150,000 acres in the interior of Bassa country. The population in 1850, as estimated by the Rev. R. R. Gurley, who was sent out by government to obtain information in respect to Liberia, was, in the republic, emigrants, 6,000; natives, 140,000 to 200,000. In the Maryland colony, emigrants, 9,000; natives, 100,000. The independence of the republic of Liberia has been recognized by France, Belgium, Prussia, the Hanse Towns, and England; and, with the latter country, a treaty of peace, friendship, and commerce, was concluded, August 1, 1849. Treaties of friendship, etc., have also been entered into with several tribes of the interior, containing stipulations for the abolition of the slave-trade, and including new territory within the political and judicial jurisdiction of the republic. The soil of the republic is capable of yielding, in the greatest abundance, the most valuable productions of the tropics. Rice, cotton, the sugar-cane, and coffee are classed among the staples of Liberia; and corn, cassada, yams, sweet potatoes, arrow-root, vegetables, and beans, of every variety, are among the productions of this region.

It is stated, on the authority of persons thoroughly acquainted with the resources of this region of Africa, that no clime or country in the world will bring coffee to higher perfection than Africa; and, whether introduced at an early period by the Portuguese and Spaniards, or whether it is a native of the country, it has propagated itself along a great extent of the African coast, without culture, for many ages. The commerce of the republic with foreign countries consists chiefly in the exportation of articles supplied by the native population, from the spontaneous growth of the country, such as palm-oil, cam-wood, ivory, tortoise-shell, and gold, which are bartered for tobacco, powder, muskets, rum, cotton goods, salt, soap, crockery, and iron wares, copper and iron rods, and American provisions. This commerce must necessarily expand with the growing development of the agricultural resources of the country, and the extension of the arts of civilization and industry, in a region so highly favored in soil and climate, and so eminently adapted

to the production of so great a variety of valuable staples.

In a letter from the Secretary of the Treasury of Liberia, in November, 1849, that gentleman says, "The committee whose duty it was to furnish you with a report, have, I think, considerably underrated the annual exports from Liberia. It may be fairly stated at \$500,000, in African commodities (one fifth of which is \$100,000), and our imports from the United States may be estimated at \$150,000. It is worthy of remark that, at present, it is only from the United States that our merchants import goods; and, further, that the kinds of goods most suitable for the African trade come from Europe. The commerce of Liberia is in its infancy, but it advances rapidly. The two principal articles of trade are tobacco and powder; and no country can compete with the United States in these items. Provisions, also, will soon find an extensive market in Liberia; already the natives have commenced purchasing them, particularly beef, pork, and salt fish. I am not exaggerating when I say that the trade advances at least 50 per cent. annually. The American cotton goods are, in quality, superior to those brought from Europe; but there is a material difference in price. The European is the cheapest, and hence the inability of the American to compete with the European. In Liberia we attribute the difference in price to the low price of labor in Europe." Changes have occurred in the commercial movements of Liberia since the date of Mr. Gurley's report. Then, Liberia imported English goods, though not directly from England; but now, importations from England are very large, while from the United States they are annually diminishing. It is estimated that there are not less than 100 ships, some of them of 1000 tons' burden, regularly trading between British ports and the coast of Africa, while a regular line of steamers plies monthly between England and Liberia. Most of the supplies of every description are derived from England; while the only articles going from the United States are powder, rum, flour, beef, pork, tobacco, herrings, mackerel, and some few cotton goods; the latter article constantly diminishing. A reliable statement, recently put forth, estimates the value of the average annual exports from all this region of western central Africa, to the European States, at some \$15,000,000, and at a commercial exchange in favor of the European merchants of about 500 per cent. The commerce has been carried on chiefly by native and Liberian traders from Liberian ports and others on the Gulf of Guinea, in European vessels. France, Spain, Denmark, Portugal, and Germany, have participated in this commercial intercourse; but they are all surpassed by Great Britain.

From the "Annual Statements of the Trade and Navigation of the United Kingdom," it appears that the imports into Great Britain from the western coast of Africa—the limits of which are not particularly designated, though estimated to contain some 50,000,000 inhabitants—consist chiefly of bar-wood, cam-wood, ebony, guano, gum-anini, gum-copal, untanned hides, palm-oil, orchal, elephants' teeth, and bees'-wax—the heaviest item, by far, being palm-oil, which averaged some 450,000 cwt. each of the five years ending with 1853; and amounted to 633,508 cwt., at a "computed real value" of £1,457,068, in 1854. The aggregate value of imports in 1854 is given officially at £1,528,896. The exports, during the same year, the produce and manufactures of the United Kingdom, or of other countries, consisted of arms and ammunition, wearing apparel, manufactures of cotton, wool, silk, iron, brass, copper, steel, and glass; salt, soap, spirits, staves, coals, beads, unmanufactured tobacco, earthenware, and porcelain; of which the heaviest items were cottons, gunpowder, guns, staves, and tobacco. The average "declared value" of cottons thus exported, during the six years ending 1854, was £187,000; and

of tobacco, the average quantity was 2,150,000 pounds. The computed real value of the 1,816,827 pounds of tobacco exported in 1854 is given at £56,760. The computed real value of all foreign exports to western Africa for the same year was £174,073; and of all domestic exports, £646,868; being more than that of 1853, and double that of 1852—the average value of each of the six years ending with 1854, being upward of £460,000.

It is thus seen that the trade of Great Britain with western Africa is rapidly increasing—amounting, in value, in 1854, to £1,528,896 imports: domestic exports, £646,868; foreign exports, £174,073; aggregate (imports and exports) £2,349,837=£11,749,185. And this, independently of the British colony of Sierra Leone, the trade of which amounted in 1854 to \$1,421,865; and of the British possessions on the Gold Coast and the River Gambia, amounting to \$1,547,285 more; and of those at the Cape of Good Hope and south Africa, swelling the amount \$8,383,090 more; making, in all, an aggregate of over \$23,000,000 in 1854, for the western coast of Africa entire. The trade of the United States with west Africa, there are no means of determining—the values of imports and exports being given in Commerce and Navigation for “Africa Generally.” “Liberia,” it is true, appears in the reports from 1849 to 1854, inclusive, but with no figures to indicate trade, and but few to indicate navigation; giving, it is inferred, the tonnage of colonization vessels only—none others, perhaps, being engaged in the direct intercourse with Liberia. The following table shows the trade of the United States with Africa during the seven years ending June 30, 1855:

Years.	Exports.	Imports.	Total.
1849.....	\$708,411	\$495,742	\$1,204,153
1850.....	759,266	524,722	1,283,988
1851.....	1,840,644	1,163,176	2,503,820
1852.....	1,246,141	1,057,657	2,303,798
1853.....	1,610,833	1,202,986	2,813,819
1854.....	1,804,972	1,386,560	3,191,532
1855.....	1,375,905	1,337,527	2,713,432

From this statement, it will be perceived that, although the figures for 1855 show a falling off in that year, as compared with 1854 and 1853, yet that there is a regular and very rapid advance from 1849. But, while the average value of the trade of the United States with all Africa, during the six years ending 1854, is found to be only \$2,200,000; that of Great Britain with west Africa, alone, for the same period, averaged \$2,800,000; and, including all of her African colonies and possessions, together with the *estimated* value of her trade on the eastern coast, it could not have averaged much less than \$20,000,000.

In 1854, the trade of the United States with “Africa Generally” rose to \$3,191,532—a higher figure than before or since; at the same time, the trade of Great Britain with west Africa, only, amounted to \$11,749,185. The value of the unmanufactured tobacco alone—derived mostly from the United States—amounted to nearly \$300,000 of that total; and the value of British trade with “Africa Generally” was, as has been seen, more than \$23,000,000, or nearly 8 times that of the United States.

The establishment of a line of commercial steamers between the United States and the western coast of Africa has been urged, as tending greatly to the augmentation of our commerce with that country. The uses which such steamers might subserve have been stated thus:—1. The transportation of free negroes from the United States to Liberia. 2. The carrying of the mails. 3. The transportation of merchandise. 4. The carrying of pilgrims on their way to Mecca. 5. The carrying, on the return voyage, of the pilgrims, who now assume the name of Hadjis; the certain and expeditious transportation of the fruit and other products of the Mediterranean; and the greater facility afforded to passengers from central Europe

to America, whose expense of travel will be greatly diminished by embarking at the south of France instead of at the usual western ports.

Palm-oil has become, within a few years, a staple of export from Liberia. More than 30 vessels were freighted with the article at her ports, in 1855; while three years before, the quantity exported did not exceed 1000 gallons, at a cost of \$1 per gallon. The quantity exported at the present time is, at least, 700,000 gallons; but the price has fallen to 83 cents per gallon. The trade in ground-nuts, chiefly carried on with France, is becoming of great importance. They are shipped in bags, and, when ground, supply a wholesome substitute for olive-oil. Sugar, cotton, and coffee are, however, viewed as the great natural staples of product for the soil and climate of Liberia. The import duties in the republic of Liberia are 6 per cent. *ad valorem*.

From recent intimations, it is not improbable that the country east of Liberia may shortly be more extensively explored, with a view of planting new settlements in the interior of the present coast line, which it is hoped will be beyond the reach of malaria. Should such an enterprise be successfully carried out, the immense natural resources of that fertile region would soon attract foreign commerce, and thus the philanthropic labors of those engaged in the movement would be greatly facilitated.—*Com. Rel., U. S.*

There can be no question that vast commercial advantages would accrue to the commerce of western Africa, if the Niger and Tschadda, the natural highways into the interior to Timbuctoo and other large cities of the continent, were effectually opened and maintained so for a few years. The last expedition is a proof that, under judicious management, and at the proper season, there is no greater danger to health in a navigation of those streams, than of other rivers in Brazil and our southern States. While the British export trade with different parts of the world has only increased in the last 20 years 50 per cent., the export trade of western Africa has more than doubled. British manufactures are mainly dependent on that quarter for several articles, especially vegetable oils and ivory. The yearly export of palm-oil has risen to the value of nearly £2,000,000 sterling, or \$10,000,000. Ground-nuts, for oil, are a leading article of production. Dyewoods are important. Of the whole imports of ivory into Great Britain, Africa supplies one half. When it is noticed what has been done in stimulating the cultivation of coffee, sugar, spices, and other staples in Liberia, there is no reason why a great stimulus may not be given also to the countries bordering on the rivers of the interior.

The following returns to Parliament illustrate the increase of British exports to the west coast of Africa, and of imports from the same region:

Years.	Exports.	Imports.	Total.
1850.....	£639,429	£605,958	£1,245,387
1851.....	654,543	794,810	1,449,353
1852.....	533,725	707,024	1,240,749
1853.....	901,402	749,378	1,650,779
1854.....	958,809	905,634	1,864,443

This is independent of the British colonies of Sierra Leone, the trade of which amounted in 1854 to \$1,421,865, and of the British possessions on the Gold Coast and the River Gambia, amounting to \$1,547,285 more, and of those at the Cape of Good Hope and in south Africa, swelling the amount \$8,383,090 more; making in all an aggregate of over \$23,000,000 in 1854, for the western coast of Africa entire.

An American steam line to Africa would be a pioneer of civilization. It would afford a rapid communication with the interesting republic of Liberia, which is proving the capacity of the Christianized and Americanized African for self-government, according to Anglo-Saxon ideas and institutions. It could not fail to promote powerfully the prosperity of that young com-

monwealth. It would practically bridge the Atlantic in a new direction, and connect together the most progressive and the most stationary of the continents. It would soon be an effectual aid in that African exodus from the soil of the new world to the ancient fatherland of the race, of which we now see the faint beginnings. Its realization would involve more wide-reaching and beneficial results than even its warmest friends have ever hoped.

Libraries. In a volume on Public Libraries of the United States, published by the Smithsonian Institution, the following statistics appear, obtained for a large part from replies to circulars, and therefore less full than those of the census :

Lien. It has been decided that no shipwright has a lien upon a vessel for the repairs, etc., done to the vessel, when he parts with the possession of the vessel, and can only recover the same from the owners in an action for debt, as he in this case, as well as tradesmen, who have no lien upon the ship, are supposed to have given the credit for the requisites required for the vessel to the owner. In maritime lien, the persons who have a claim in the Admiralty Court *in rem*, and can compel reimbursement, consist of those who have rendered services to the ship by their labor, as mariners, by pilotage, tonnage, salvage, and by the loan of money as bottomry for repairs. The wages of seamen have the first claim upon a vessel, and then come salvage, pilotage, tonnage, or bottomry. Bottomry, however, has a precedence over prior salvage, although it gives way to subsequent salvage. Sir John Michel, speaking of lien, says : " Subjects which operate for the protection of prior interests are privileged over those interests."

Lieutenant, of a ship of war, the officer next in rank and power to the captain, in whose absence he is accordingly charged with the command of the ship, as also the execution of whatever orders he may have received from the commander.

Lieutenant (*locum tenens*, holding the place of), in a military sense, means the person second in command ; as, lord-lieutenant, one who represents the prince or governing power ; lieutenant-general, one who stands next to the general ; lieutenant-colonel, the next to a colonel ; and lieutenant, the next to a captain, in every company of both foot and horse, and who takes the command upon the death or absence of a superior officer.

Life-Boats. See LIFE-PRESERVERS.

Life-Preservers. Although it too frequently happens that an accident which materially endangers the life of an individual, deprives him, in the meantime, of that presence of mind which alone would enable him to take proper measures for his safety ; yet to have meditated, in an interval of leisure, upon the best method of proceeding in case of emergency, must tend greatly to diminish the embarrassment and confusion that commonly accompany the accident, even if it should not be thought necessary to provide any particular apparatus for the purpose of escaping the danger. There are also many ways in which those who are not immediately involved in the disaster may contribute to the preservation of life, whether actuated by interest, or by humanity only ; and the modes of relief will therefore be naturally divided into the *internal* and the *external*, whether relating to *fires* or to *shipwrecks*.

Internal Fire-Escapes.—Whenever a family establishes itself in a residence not detached from others, it becomes of importance to ascertain what facilities the house affords for ascending to the roof, and for passing to those of the neighboring houses. It is scarcely possible that a conflagration should extend at once to the contiguous houses on each side, before the inhabitants of the house in question have had time to escape. But in a detached house, if there are not two or more stair-cases remote from each other, and even in a house contiguous to others, when there is no facility of communicating by the roof, it becomes highly expedient to provide some *internal means* of escaping through the windows, in case of fire, and to have on every floor a strong rope, with a hook or a loop at the end, by which it may be fastened to a bed-post, so as to enable an active person to descend by its help out of the window, finding from time to time a partial footing in the inequalities of the wall. This process will be greatly facilitated by having the rope knotted at intervals of about a foot throughout its length ; the knots being nearly as convenient as the blocks or clips, that are sometimes made for the purpose of retarding the descent, by holding them, and regulating the friction by the pressure of the hand ; unless the clip be attached to a strong cross-bar, on which a person may sit, while he regulates the position of the clip by its handles, allows himself to descend with more or less velocity at pleasure.—EMERSON'S *Mechanics*, figs. 228, 229 ; LEUPOLD'S *Theatrum Machinarum*, plate liv.

External Means of Escape from Fire.—The external means to be employed in cases of conflagration must be provided by the managers of fire-offices, or by other public officers ; and every ingenious workman whom they may employ will be able at his leisure, to devise such apparatus as he can the most conveniently execute, and to give it a full trial in the absence of all danger ; it will therefore only be advisable that he should compare for himself the particular inventions which have been suggested for this purpose, and that he should choose from among them such as he thinks most likely to do him credit ; and he may, indeed, very possibly find means of improving on any of them. In Leupold's *Theatrum Machinarum* (plates liv. lv.), we find the representation of a chair calculated to be drawn up or down by means of pulleys. Mr. Varcourt obtained, in 1761, the approbation of the Parisian Academy of Sciences for his invention of a hollow mast, fixed in a wagon, and supporting a stage, with the means of ascending and descending.—*Hist.*, p. 158. In the beginning of the present century, a fire-escape of Mr. Audibert was approved by the Parisian Institute.—*Mém. Inst.*, lv. A committee was also appointed for examining several similar inventions at the Lyceum of Arts, and a medal was awarded by it to Mr. Daujon, for his apparatus, which consists of a platform carried on wheels, supported by three frames, with brass wires, on which boxes are made to slide up and down for the conveyance of persons or furniture.—*Annales des Arts*.

Repertory, ii., vol. i., p. 439. Mr. Collins's invention of pipes raised by ropes, and affording a centre to a long lever, is described in the fourth volume of the *American Transactions*, and in the *Repertory*, vol. xv., p. 35. In the 81st volume of the *Transactions of the Society of Arts* for 1813, p. 244, we have an account of a fire-escape invented by Mr. Adam Young, for which he received a medal from the society. It appears to constitute by far the most portable of ladders, consisting of cross bars or rounds connected by ropes, and having their ends fitted together, so as to form a pole, which is readily elevated to the window; and the rounds being separated, and the hooks at the end properly fixed to the window-frame, the whole forms itself into a very convenient ladder of a mixed structure. The 34th volume, for 1816, p. 227, contains a description of Mr. Braby's fire-escape, consisting of a car made to slide on a strip of plank fixed to a pole, and governed by a rope, which is cased with iron, to protect it in case of necessity, from the effect of the fire.

A great many other forms of fire-escapes might be noticed, for it is one of those subjects which readily appeal to the ingenious mechanic in a large city where fires are numerous; and every form of fire-escape must at times fail. Hence, there has been a sort of competition among the uneducated inventors, who have displayed some mechanical ingenuity, but have not, so far as we are aware, developed any new principle.

Internal Means of Escape from Shipwreck.—The means of escaping from shipwreck may be similarly divided into *internal* and *external*, or into the precautions to be taken by the ship's company, and the measures to be adopted by persons on shore. The internal means depend either on enabling the individuals to swim or float, or establishing a connection with the shore by ropes; and of the former, we may first consider those which require no particular preparation before the occurrence of the accident that calls them into action, and which are, therefore, the most universally applicable. Of such expedients, the most effectual appear to be those which depend on the employment of empty water-casks for assisting the ship's company to drift on shore. 1. A paper on the arrangement of water-casks, to serve as floats in case of shipwreck, appears in the publications of the Society for the Improvement of Naval Architecture, dated in 1796 (vol. ii., p. 51). 2. In 1818, Mr. Grant of Bideford obtained a gold medal from the Society of Arts, for the invention of a life-preserver, consisting of a 36 gallon cask, with some iron ballast fixed on a wooden bed, and lashed to the cask, and with ropes round it for the men to hold; and it was found that 10 men were supported by it with convenience in tolerably smooth water, the bung of the cask being well secured by cork (vol. xxxvi., p. 63). The ballast could be of very little use, and a cask simply tied round with a rope, like a common parcel, would probably answer the purpose equally well. It would, indeed, be prudent for every ship in a storm, on a lee shore, to have a few of her casks well emptied and stopped, and tied in this manner, before the actual occurrence of imminent danger. 3. In 37th volume of the *Transactions of the Society* (p. 110), there is an account of Mr. Cook's life-raft, consisting of a square frame with canvas nailed across it, supported by a cask at each corner, for which the gold medal was voted to him. 4. It is followed by a description of Lieutenant Rodger's life-raft (p. 112), which obtained a similar compliment. This raft has the advantage of requiring only such materials as are usually found on board of every ship; capstan-bars, boat-masts, yards, or any other spars of moderate dimensions, which are tied together so as to make a sort of wagon frame, with a large cask fixed on each side; it appears to afford a very convenient support to the men, but it can scarcely

possess any great strength for resisting the force of the breakers.

Mr. J. Bremer, a clergyman in the Orkneys, had received a medal from the Society in 1810, for his method of converting any ship's boat into a life-boat by putting into it 3 or 4 casks lashed to the keel, which is to have ring-bolts fixed in it for receiving the ropes by which the casks are fastened; he gives particular directions for making all the necessary arrangements, in the 28th volume of the *Transactions* (p. 134); he particularly advises that no use should be made of the natural buoyancy of the cavity of the boat, but that the bottom should be perforated without hesitation, wherever the hole would afford any additional facility for fixing a rope. Captain Manby's jolly-boat, fitted as a life-boat, "at the expense of £3," seems to be comprehended among those preparations which are to be made previously to the voyage. The buckling a soldier's canteen on his breast as an assistance to enable him to float, belongs to those temporary expedients which may occasionally be employed with advantage. Tying a hat in a pocket-handkerchief, and holding it as a float, has been recommended by Mr. Dawson in the *Philosophical Magazine* (vol. xx., p. 362); he advises that the crown of the hat should be held downward, and observes that a stick may be employed, to enable us to use 2 or 4 hats at once; but this method can only be adopted when the accident occurs in very still water.

In China, a frame of bamboo surrounding the person is used for a float, and the lightness and strength of this substance must well adapt it for the purpose; sometimes also a gourd is tied to a child, to secure its floating in case of accident. The inflated goat-skins used from time immemorial by the Arabs, or the seal-skins employed by the Chilians, have the disadvantage of being easily rent or torn by a rock or a spar; an objection which is also more or less applicable to all substances containing air; for example, to the air-jackets described in Leupold's *Theatrum Pontificum*, published about 1724. A float of a semicircular form was recommended by Ozanam, the author of the *Recreations*; and Bachstrom, in his *Art of Swimming*, proposed to float a troop of cavalry, by fixing cork to the saddles. The cork jacket of Gelacy is described in the *History of the Parisian Academy of Sciences* for 1757, and Lachapelle's *Scaphander*, which is considered an improvement on it, in the volume for 1765. In the year 1764 the attention of the British public was particularly called to the floating powers of cork, by some experiments which were made with cork jackets on the Thames, together with some comparative experiments on air-jackets; and Dr. Wilkinson, in the *Philosophical Transactions* for 1765, describes some experiments by which he ascertained that about a pound of cork was amply sufficient to enable a man of ordinary size and make to float without effort. It is almost superfluous to enumerate the multitude of trifling variations that have been made in the arrangements of cork jackets and air-jackets, apparently for the purpose of exciting a momentary interest, though possibly from the best motives. Mr. Bosquet advised a bag of cork shavings to be kept in readiness by each person; the *Seaman's Friend* was composed of two pieces of cork, united by straps; the *Collinetta* was a hollow vessel of copper, divided into cells; a "marine spencer" has been described by Mr. Spencer, in the 16th volume of the *Philosophical Magazine*, consisting of a number of old corks, arranged so as to form a girdle; and in 1806, Mr. T. C. Daniel obtained a gold medal from the Society of Arts, for the invention of an apparatus of waterproof leather, surrounding the body, which, according to the testimonials he produced, had saved the lives of some persons who had been sailing in a pleasure-boat on a river. In smooth water, it has been suggested that throwing a foot-ball, with a small weight tied to it, to the person immersed, would often afford sufficient assistance;

and, with respect to floating, there is no doubt that any of the assistances which have been proposed would be sufficient if they were at hand; but there is another object, to which it is necessary to attend, in cold, and even in temperate climates, that of supporting a temperature compatible with life and health, if the immersion is likely to be of long duration; and an additional provision of worsted stockings, jackets, and trousers, will be almost as essential, in such cases, as the means of obtaining buoyancy.

The invention of India-rubber cloth led to the introduction of inflated belts, the advantages of which, compared with cork, and other forms of belt, are their greater buoyancy compared with their bulk, and their greater portability, for, when emptied of air, they can be folded up, and packed into a small space. The objections to them are their liability to get punctured or torn, and to decay, from being put away damp; the metal valves by which they are inflated may also get out of order; during the hurry and confusion of a wreck they are liable to be only partially inflated, and the valves to be only half screwed up, so as to allow of the escape of the inclosed air. Commander J. R. Ward, R. N., inspector of life-boats to the National Life-Boat Institution, has invented a belt with 4 compartments, which admit of being separately inflated, thus mitigating the danger arising from puncture or injury to the inflating valves; it has a buoyancy equal to 30 lbs., and should two of its compartments be disabled, the remaining two would be sufficient to float the wearer.

For the rough purposes of ordinary boat-work, Commander Ward insists on the advantages of cork as a material for life-belts, and he has invented a form of belt, which has been selected by the National Life-Boat Institution for the use of its life-boats' crews. The buoyant power of each belt is from 20 to 24 lbs., the cork is uncovered, so that its quality can be seen, and it is divided into numerous narrow pieces, each of which is sewed separately to a strong linen or duck belt, which covers the body from the arm-pits to below the hips. The pieces of cork are distributed in two rows, one above, the other below the waist, and the belt is secured closely about the body by means of strings passed round the waist, between the two rows of cork. It is further secured by other strings, crossed over the shoulders. By this arrangement the trunk of the body is enveloped in cork, attached so as to be quite flexible, and to allow of the usual movements of the body without inconvenience, while it protects the body against injury from blows, and is a warm covering in cold weather.

Various forms of buoyant mattresses have been contrived by Mr. Laurie and others. As manufactured by Mr. Silver, numerous waterproof tubes are partly distended with horse-hair, woolen flocks, or cocoa-nut fibres, so that, should one or more of the tubes fail, the others may suffice to sustain the required weight on the water. The tubes are made up into mattresses, pillows, and floats—the last to be placed under the thwarts of boats. A mattress weighing 17 lbs. sustains in the water 284 lbs. A pillow sustains 28 lbs. A mattress for emigrant vessels, sold at 9s., was proved at the Great Exhibition. It sustained 96 lbs. in the water during 5 days, without being injured. Floating mattresses are also made, filled with cork shavings. In the Great Exhibition, Mr. Rhind had various models of deck seats and benches for steamers, so constructed as to be readily formed into rafts, each of which was capable of sustaining 8 persons.

For the second object which is desirable to a ship in distress, that of obtaining a safe communication with the shore, it has been usual of late years to rely principally on the humane exertions of persons who may be on the coast, and who may have made preparations for this purpose; and with this view, some instructions for properly co-operating in the measures to be

adopted with Captain Manby's apparatus have been liberally distributed to all ships when they received their papers from some of the British custom-houses. There are, however, some simple expedients which may be adopted for this purpose by persons on board of the ship; for example, the making a kite with a pocket-handkerchief stretched over a hoop, and causing it to carry a cord to the lee shore, by means of which a stronger line, and at last a hawser, may be drawn by persons standing on the beach. A line may also sometimes be carried on shore by a cask, allowed to drift before the wind; and a bag has been recommended to be attached to such a cask, or to a buoy, in order to act as a sail, and to insure its crossing the surf. Mr. Cleghorn was also rewarded, in 1814, by the Society of Arts, for the invention of a buoyant line, having a heart of cork, to obviate the inconvenience which would arise from its sinking and being dragged on the stones under the breakers; but he observes, that in heavy storms there is generally a current along shore which renders the method almost impracticable. (*Transactions*, xxxii., p. 181.) A Mr. Wheatley assures us, in Captain Manby's *Essay*, that his own life, and those of 8 other persons, were saved, in 1791, by a lead line, which was carried on shore by a Newfoundland dog that he happened to have on board, when two good swimmers had been drowned in the attempt to swim on shore. It had occurred to Lieutenant Bell, in 1791, that a rope might be thrown from a ship which had struck, by means of a mortar carrying a heavy shot, and upon the principle of the gun harpoon; and he showed the practicability of the suggestion by an actual experiment, in which a deep-sea line was carried to a distance of about 400 yards. (*Trans. Soc. Arts*, xxv., p. 186.) He recommended that every ship should be provided with a mortar capable of carrying such a shot, and observed that it might be placed on a coil of rope to be fired, instead of a carriage. The line was to be coiled on handspikes, which were to be drawn out before the mortar was fired. In 1792 he received a premium of 50 guineas from the Society of Arts (*Transactions*, xiv., p. 204); and he obtained his promotion in the Ordnance as an acknowledgment of his merits. The shot was to weigh about 60 lbs. or more, and the mortar 5 or 6 cwt. The experiments of the French artillery at Lafere were subsequent to those of Mr. Bell, though they have sometimes been quoted as the first of the kind.

It has, however, generally been thought impracticable to manage a mortar with effect under the circumstances of actual shipwreck; and Mr. Trengrouse has preferred a rocket, as more easily fired, and as having a smaller initial velocity than a shot, so that the rope would be less in danger of being broken by the impulse. He found that a rocket of 8 oz. carried a mackerel line 180 yards, and a 1 lb. rocket 212; and in some experiments made under the inspection of the Society of Arts, a rocket $1\frac{1}{2}$ inch in diameter carried a cord across the Serpentine River in Hyde Park. The musket is provided with a valve, to prevent the escape of the materials of the rocket; and it is to be fired with a little powder, without wadding. The whole apparatus is packed in a chest, containing from 8 to 12 rockets, the musket, a life-spencer, a chair to traverse on a rope, a canvas bag, and a ball of wood to throw to a person swimming. Mr. Trengrouse was complimented with a medal from the Society of Arts in 1820. (*Vol. xxxviii.*, p. 161.)

External Means of Escape from Shipwreck.—The means to be employed by persons on shore, in cases of shipwreck, depend either in projecting a line over the ship, or on the use of a life-boat. Mr. Bell had cursorily observed that a line might be carried over a ship from the shore by means of his mortar; but for the actual execution of this proposal, in a variety of cases, we are indebted to the meritorious exertions of

Captain G. W. Manby, whose apparatus, according to the report of a committee of the House of Commons, dated in March 1810, appears "to be admirably adapted to its purpose, and to have been attended with the fullest success in almost every instance." In consequence of this report, Captain Manby was thought worthy of a parliamentary reward; and he afterward published a description of his inventions, under the title of "An Essay on the Preservation of Shipwrecked Persons," 8vo, London, 1812. He had previously received a gold medal from the Society of Arts in 1808 (*Transactions*, xxvii., p. 209). His success makes it expedient to extract from his essay a detailed description of the apparatus; and it will be easy to make it somewhat more intelligible by a slight alteration of the order of arrangement: "The method of affixing a rope to a shot, for the purpose of affecting communication, when projected from a piece of ordnance over a stranded vessel, was at length succeeded in, by introducing a jagged piece of iron, with an eye at the top, into a shell, and securing it by filling the hollow sphere with boiling lead; and in another way, by drilling a hole through a solid ball, and passing a piece of iron with an eye to it, as before described, to the bottom, where it should be well secured by riveting. To produce the means of connecting a rope to a shot, and prevent its being burnt, and rendering it 'irresistible' to the powerful inflammation of gunpowder, was the labor of infinite time, and the number of experiments to accomplish it were numerous. Chains in every variety of form, and great strength, breaking, proved that it required not only an elastic, but a closer connected body. At length, some stout platted hide (fig. 2), woven extremely close to the eye of the shot, about two feet in length beyond the muzzle of the piece, and with a loop at the end to receive the rope, happily effected it." (fig. 2) Fig. 1.

"This method is certainly desirable, as a rope may immediately [as] it is required, be affixed to the loop, and applied in service. The form of the platted hide may likewise be woven by twisting it in the manner that the lashes of whips or rope are spun. There is another method, by passing the rope through a case of leather, taking the greatest care that it is so well secured at the eye of the shot as to leave no room for the slightest play, as is represented by the annexed barbed shot (fig. 2).

Fig. 2.

When the crew of the distressed vessel are incapable of availing themselves of the benefits arising from communication, they having previously lashed themselves in the rigging to prevent being swept away by the sea, which is repeatedly breaking over them, and when, from long fatigue and the severity of the storm (on which occasions it too frequently occurs), they totally lose the use of their limbs, and are rendered incapable of assisting themselves in the slightest degree—the advantages of this shot are, that, on its being projected over the vessel, and the people of the shore hauling it in, it firmly secures itself on some part of the wreck or rigging, by which a boat can be hauled to the relief of the distressed objects; and by the counterbarbs it is rendered impossible [that it should] give up its hold, or slip, while that part of the wreck remains to which it has secured itself.

"Among the many that have been saved by this shot, the following are testimonials of a few of the cases: 'We, the crew of the brig *Nancy* of Sunderland, do hereby certify that we were on board the said vessel when she was stranded on the beach of Yarmouth, on Friday morning, the 15th of December, 1809, and compelled to secure ourselves in the rigging to prevent being swept away, the sea running so high over the vessel. And we do further declare and certify that Captain Manby, firing a rope with a hooked shot, securely holding on to the wreck, enabled a boat to be hauled from the shore over the surf to our relief, otherwise we must inevitably have perished.' This certificate is attested by six signatures.

"Facilitating communication is at all times of importance; but when the stranded vessel is in momentary danger of going to pieces, this point becomes a consideration of extreme urgency. I feel a persuasion that this particular service can only be carried into effect by a small and light piece of ordnance, the range of which is consequently very inconsiderable, when compared with that of a large and heavier piece, as it is weight alone that conveys the rope. In order, therefore, to increase the powers of shot projected from a small mortar, its natural form must be varied, so as to give it additional 'preponderance.' The annexed shape, in the form of a pear (fig. 3), has been used with the greatest success; for, by the increased weight, the shot's momentum and power over the line is in consequence considerably augmented in its range; and when made to fit the piece as close as possible, a great increase of velocity is likewise produced from the decrease of windage.

Fig. 3.

"Portability in the construction of a piece or ordnance (as just described) is the very essence of this service; and communication with the stranded vessel or wreck may be effected with a cord, by which cord a rope can be conveyed, and by that rope a hawser or cable sent to the distressed vessel; for this purpose the annexed was constructed (fig. 4). A person completely equipped with every necessary apparatus to effect communication with a vessel driven on a lee-shore * * * the horseman, fully equipped, traveled a mile and a half, the howitzer was dismounted, and the line projected 153 yards, in six minutes.

Fig. 4.

"The application of a small piece of ordnance likewise offers particular advantages, capable of being employed from a boat to go to the assistance of a vessel grounded on a bar when running for a harbor, the necessity of which repeatedly occurs, and was twice witnessed at Blakeney, on the 10th of November, 1810, when boats endeavored to go to their relief, and were enabled to get out of the harbor on the ebb tide, within 20 yards of the vessel; but it was found impossible to approach them nearer. Had such boats been provided with a piece of this description, and the same firmly secured on a stout piece of plank, by the holes left at each corner of the iron bed, they might have projected a small rope, coiled in a crate or basket, made to the form of the bow of the boat; and the persons in the boat, so provided, would not have remained the distressed spectators of the untimely end of their fellow-creatures, without being able to afford them the smallest relief, although so little was then wanting for that desirable purpose.

"Although advantages have been pointed out in the use of these small mortars, it is necessary to be kept in remembrance that they are produced for particular services; as the nature of the coast, and circumstances attending the distressed vessels, will direct what piece is best adapted to the undertaking. To enable

the mind to form a judgment of what can be effected by other pieces, the following are the minutes of experiments made with a $5\frac{1}{2}$ -inch brass mortar, stating the quantity of powder used, and distance the ropes were projected against a strong wind, at the angle of 17° (elevation): weight of the mortar and bed about 300 lbs.:

Ounces of powder.	Yards of inch and half rope.	Yards of deep-sea line.
4	184	148
6	159	182
8	184	215
10	207	249
12	235	290
14	250	310

"With a short 8-inch mortar, the weight of which, and bed, was supposed to be about 700 lbs; the angles of elevation uncertain:

Ounces of powder.	Yards of deep-sea line.	Yards of two-inch patent Sunderland rope, capable of hauling the largest boat from a beach.
82	439	..
32	479	..
82	..	886

"Directions for using the Apparatus.—When the rope (which should be pliant and well stretched) is brought on the beach or cliff opposite to the stranded vessel, the most even spot, and free from projecting stones, should be selected to lay it on, and great care be taken that no two parts of it whatever overlay or even touch each other; nor must it be laid in longer lengths than of two yards. But to project a small line or cord, it will be necessary, if it is required to contract the faker to half a yard at most, to avoid the jerk received at the end of each right line. The best method, with such a description of cord, is to lay it on the ground in the most short and irregular windings, to relieve it from the powerful impulse. To prove the effect of the impulse on a rope, if it is faked in lengths of 10 or 15 yards, it will break each time, as it then becomes a most powerful pendulum. These precautions are absolutely necessary to the success of the service.

"The following has, after various trials, been found a certain method of laying the rope, and placing it into compartments." (*French Faking, fig. 5*)

Fig. 5.

removed that might otherwise obstruct its rapid flight. Its advantages are, that it will allow the eye rapidly (yet correctly, just before firing, which is absolutely necessary) to pass over the different compartments, and at once discover if any fake has been displaced by the storm, or by any other casualty or accident come in contact with another part, which would destroy its application by the rope breaking.

"It may likewise be coiled in the manner used in the whale fishery, *whale lair* (fig. 6); and in the method called *chain faking* (fig. 7).

Fig. 6.

Fig. 7.

It is, however, necessary to add, that great attention is required in laying it agreeably to the two latter methods, arising not only from the arm being liable to get under certain parts of the rope, and thereby dis-

place it, but from the great anxiety of mind natural on these occasions, where the lives of fellow-creatures are literally dependent on the correctness with which the rope is laid; it is therefore extremely difficult, in a moment of agitation, to determine whether any overlay has taken place, an error that would infallibly destroy every endeavor, and occasion even the fates of those whose lives we might be exerting ourselves to preserve. Could persons in the performance of this service be always collected, the two latter methods would have a decided advantage over the first mode of faking, they being laid in a much less space of time.

"As all these methods of laying the rope occupy time to place it with the care necessary; and as it has repeatedly happened that a vessel very soon after grounding, has gone to pieces, and all hands perished; it was necessary to produce a method of arranging the rope, so that it could be immediately projected as soon as it arrived at the spot; and none proved so effectual as when brought ready in a basket (fig. 8.) In this

Fig. 8.

case, the rope should be most carefully laid in alternate tiers or fakes, no part of it overlaying; and it should be well secured down, that in traveling it be not displaced; but, above all, no mistake must happen in placing the basket properly. For example, that the end of the basket, from which the shot hangs in the above figure, should be previously marked, and must be placed toward the sea or wreck, that the rope be delivered freely, and without any chance of entanglement. It will be scarcely necessary to add, there will be several tiers of the rope when laid. The utmost care and attention are required in laying the rope in tiers with strict regularity, to prevent entanglement.

"The next is the application of the mortar. If the wind is sideways to the shore, it must be pointed sufficiently to windward to allow for the slack of the rope lighting on the object, as the rope will, of course, be considerably borne to leeward by the effect of a strong wind, and by its being laid at a low elevation insures the rope falling against the weathermost part of the rigging. While this service is performing, great care should be taken to keep the mortar dry; nor should it be loaded until every thing is ready; when that is done, it should be primed; but as it would be impossible to do it with loose powder in a storm, a tube is constructed in the simplest manner of common writing paper (the outer edge being cemented with a little gum) in this form (fig. 9). It is filled with meal gunpowder, made into paste with spirit of wine; when in a state of drying, run a needle through the centre, and take care the hole is left open, for, on the tube being inflamed, a stream of fire darts through the aperture with such force as to perforate the cartridge. The mortar should then instantly be fired; Fig. 9.

and in order to lessen a difficulty that has often occurred in performing this service, a pistol may be used, having a tin box over the lock, to exclude the effect of wind or rain on the priming; and the muzzle being cut [obliquely], dilates the inflammation, so as to require but little exactness in the direction of the aim.

"We will suppose the communication to be secured, although it is scarcely necessary to offer any other assistance than that of a rope, as the inventive genius

of a sailor will supply every thing else; yet I could expect the people on shore to get a boat ready for meeting the vessel when driven on a beach: it is the promptest and most certain method of relief, as well as the most easy to be accomplished; for by hauling her off with the rope projected, the boat's head is kept to the waves, and not only insures safety by rising to the surge, but prevents her upsetting. When the rope attached to the shot (not having barbs to it), is fired over the vessel and lodges, let it be secured by those on board, and made fast to some firm part of the rigging or wreck, that they may haul off a boat by it; but should there not be any boat, then haul on board by the projected rope a larger one and a tailed block, through which a smaller rope is rove. Let the large rope be made fast at the mast-head, between the cap and the top of one of the lower masts, and the tailed block a little distance below it; but, if the mast should have been cut or carried away, then it must be made fast to the loftiest remaining part of the wreck. When this is done, there will be supplied from the shore a cot, hammock, netting, basket, hoop, or any of the numerous resources of seamen, which will run on the larger rope, and be worked by the people on shore. If a cot be used, the men may be so securely fastened to it as to preclude all possibility of falling out, and then be brought from the wreck, one by one, in perfect safety.

"While communication is gaining, 3 stakes should be driven into the ground in a triangular position, so as to meet close at the heads to support each other. As soon as communication has been effected by the crew of the vessel, and they have secured the line attached to the shot, made fast to these stakes, the crew will haul on board by it a large rope and a tailed block, through which a smaller rope is to be rove, both ends of which (the smaller rope) are to be kept on shore. When they have secured these on board, and the larger rope is rove through the rollers, let a gun-tackle purchase be lashed to it, then lash the purchase to the stakes. By the means of the purchase the larger rope may be kept at a fit degree of tension; for, if care be taken to slacken the purchase as the ship rolls out to sea, the danger of the rope being broken will be guarded against; and on the other hand, if the purchase be gathered in as the ship rolls toward the shore, the slackness of the rope, which would prevent the cot (fig. 10) traversing as it ought to do, and plunge it in the water more than it otherwise would, will be avoided.

"Supposing neither boat nor cot apparatus at hand, first cast off the shot from the projected rope, and with a close hitch, let it be put over the head and shoulders of the person to be saved, bringing it close under

seize every moment for respiration, after each surf has passed over the body. If circumstances compel recourse to this method, care must be taken to free the rope from any part of the wreck, and to jump clear away; but should there be more than one on board, each man should make himself fast in the same way, about 4 four feet from the other, and join hands, all attending to the same directions.

"For giving Relief to Vessels Stranded on a Lee Shore in a Dark and Tempestuous Night.—It will be requisite, first, to devise the means of discovering precisely where the distressed vessel lies, when the crew are not able to make their situation known by luminous signals; secondly, to produce a method of laying the mortar for the object, with as much accuracy as in the light; thirdly, to render the flight of the rope perfectly distinguishable to those who project it, and to the crew on board of the vessel, so that they can not fail of seeing on what part of the rigging it lodges, and consequently have no difficulty in securing it. To attain the first object, a hollow ball was made to the size of the piece, composed of layers of pasted cartridge paper of the thickness of half an inch, having a lid on the top to contain a fuse (fig. 11), and it was then filled with about 50 luminous balls of star composition, and a sufficient quantity of gunpowder to burst the ball and inflame the stars. The fuse fixed in the ball was graduated, to set fire to the bursting powder at the height of 300 yards. Through the head of the fuse were drilled holes, at equal [distances], to pass through them strands of quick match, to prevent the possibility of any accident from the match falling out, or from its not firing the fuse. On the stars being released, they continued their splendor, while falling, for near one minute, which allows ample time to discover the situation of the distressed vessel. During the period of the light,

Fig. 11.

a stand, with two upright sticks (fig. 12), (painted white to render them more discernible in the dark), was ready at hand, and pointed in a direct line to the vessel.

Fig. 12.

"A shell

affixed to the rope, having four holes in it to receive a like number of fuses (headed as before described), and filled with the fiercest and most glaring composition, which, when inflamed at the discharge of the piece, displayed so splendid an illumination of the rope, that its flight could not be mistaken.

"To get a Boat from a Beach over the Surf.

—The importance of going to the relief of ships in distress at a distance from the land, or for taking off pilots, was viewed as of the highest consequence by the elder brethren of the Trinity House, and offered to my particular attention by several distinguished characters. After numerous experiments to accomplish it in various ways, the mode following was most approved:—About 40 fathoms of 2½-inch rope, made fast to 2 moving anchors, was laid out parallel with the shore, at a distance beyond the sweep of the surf; to the centre of this rope was made fast a buoy, of sufficient power to suspend the great rope, and prevent it from chafing on the sand, rock, or stones, as well as embedding, a circumstance that has rendered it impossible, on a sandy or shingly coast, to heave out an anchor with a

Fig. 10.

each arm, drawing it tight, observing particularly the knot is on the breastbone; for, by having the knot in that position, on the people of the shore hauling the person from the wreck, he will naturally be on his back, consequently, the face will be uppermost to

tre of this rope was made fast a buoy, of sufficient power to suspend the great rope, and prevent it from chafing on the sand, rock, or stones, as well as embedding, a circumstance that has rendered it impossible, on a sandy or shingly coast, to heave out an anchor with a

rope to it from the shore. As this service should be performed in fair weather (to be prepared for the storm), it may be regulated with the greatest exactness, and should take place at the top of high-water, that the upper part of the buoy may be at the full stretch of its power, and only seen at that time. Should the shore be extremely flat, it will be desirable to place another set at a sufficient distance beyond the first, to insure the operation of this method in any state of the tide.

"The royal mortar being brought to the spot, is to be pointed in the direction for the buoy, and should be laid at a very low elevation, but such as to insure the range; for the more it is depressed, the less slack of rope there will be from the parabola formed in the shot's flight; the basket with the rope ready laid (having a barbed shot to it) is to be placed in the front of the mortar; on its being fixed, instantly haul the slack of the rope in, to prevent the effect produced on it by a strong tide; which being done, let the remainder be gently hauled in, to insure the shot's grappling with the great rope; when that is caught and hooked, a power will be acquired fully adequate to the service.

Fig. 13.

"As a cast-iron anchor appears particularly adapted to this method, and would be much cheaper than hammered, fig. 13 is a plan of one which the British Navy Board approved, and allowed me to cast at their expense, for the purpose of making the experiment.

When a vessel is in that extreme and perilous situation, driven under a rugged and inaccessible cliff, and in danger of going soon to pieces, the most prompt method I should suggest is, by lowering to the crew a rope with stiff loops spliced into it (fig. 14), at the distance of a foot and a half from each loop, of sufficient size to contain the foot, by which they can ascend as a ladder. This rope-ladder is capable of being projected; and one of an inch and a half rope was thrown from a mortar 194 yards. It might also, from the simplicity of its structure, be extremely useful in escaping from a house on fire. By making one end fast to the leg of a bed or a table, the person would come down from the window in safety, and with much less difficulty, and quicker, than with the common rope-ladder, which is heavier and more unwieldy. It has great advantages when employed in saving shipwrecked men in situations just described, when, from extreme cold, and almost benumbed limbs, it would be impossible for them to climb up a rock, or ascend it even by the aid of a common rope. The holds, thus spliced in, will support both hands and feet."

Fig. 14.

The Report of a Committee of the House of Commons contains also a paper of instructions for the managers of Captain Manby's apparatus on shore, which are somewhat more minute than the directions published in his Essay. For example:—"If the wind be sideways to the shore, the mortar must be pointed sufficiently to windward to allow for the slack of the

rope lighting on the object, as the rope will, of course, be borne considerably to leeward by the effect of a strong wind. The distance your judgment decides the vessel to be from the shore should regulate the charge of powder as stated in the scale, taking just a sufficient quantity to clear the object; an attention to this will be more certain of your effecting communication, and guarding against the danger of the rope breaking, or any other circumstance that might prevent the successful performance of the service. The elevation of 15° is to be preferred, particularly if the wind is sideways, pointing the mortar sufficiently to windward, as the rope would then fall against the weather-most part of the rigging of the stranded vessel. When a vessel is driven on shore in the night, you will flash gunpowder as often as convenient on your way; this will animate the crew, and denote to them you are coming to their assistance. On getting to the spot where you have reason to suspect the vessel lies, as you are not able to discover her from the extreme darkness, and if the people on board can not [make known] their situation by luminous signals, or noises (which they will be directed to make if possible), you will lay the mortar at a very high elevation, and fire a light ball. Just before you fire (the rope) it would be advisable to let off a blue light to put the crew on their guard, to look out, and be ready to secure the rope. The service can be performed with a carronade."

In the report we have a copy of directions to persons on board vessels stranded on a lee-shore, proposed to be delivered to the masters at the custom-house. It is observed, that even snapping a pistol, when the powder is wet, may sometimes afford a signal visible on shore, from the sparks of the steel alone. The other parts of the directions will be supplied by those who understand the principles of the proposed mode of relief.

Rockets have of late years been much employed instead of the mortar, in Manby's apparatus for throwing a line to a ship in distress. "Dennett's Rocket Apparatus" is supplied to many stations along the coast. The only advantage which the rocket has over the mortar is its greater portability; for, being much lighter, it can be used with greater facility among rocky cliffs, and in positions difficult of access. The disadvantages of rockets are, that they are somewhat uncertain, sometimes exploding as soon as ignited, to the danger of the bystanders; and they are also liable to deteriorate from the effects of damp or of age. Moreover, being expensive, they can not be often employed in trials, so as to keep up the practice of the people employed in using them. The range of a shot from a 24-lb. mortar, which is the ordinary size, is about the same as that of a 12-lb. rocket, which is the largest in use. As the management of the mortar and rocket apparatus is much better understood by the officers and men of the coast-guard service than by ordinary boatmen and fishermen, it has been almost entirely left in their hands, and is provided by the Board of Customs. There are in England 132 mortar and rocket stations; in Scotland, 15; in Ireland, 22. Several inventions, or variations, in the Manby apparatus may be just glanced at. M. G. Delvigne uses a howitzer instead of a mortar, while a portion of the line to be carried is contained in the projectile. Mr. Greener has a method of discharging a rocket, with a line attached, from a light harpoon gun. When discharged, the rocket ignites, and is said to prolong the range to a greater distance than if the gun or the rocket were alone employed. Captain Jerningham, R.N., has an anchor of a particular form, which he proposes to fire from a Manby's mortar, in sufficient numbers to afford the means of hauling a life-boat through the surf. Mr. A. G. Carte employs a war-rocket instead of a Dennett's rocket.

Life-boats.—The last description of the inventions

to be considered, with regard to the preservation of lives in cases of shipwreck, is that of life-boats, which are of such a construction as to be incapable of sinking, even when filled with water. The occasional adaptation of the common boats of the ship to such purposes, by means of empty casks, has been already noticed. But the boats now in question are supposed to be kept on shore at proper stations; and manned by active persons, who are in the habit of exerting themselves for the relief of seamen in distress. Mr. Henry Greathead of South Shields, received a gold medal and fifty guineas from the Society of Arts, in 1802, and a parliamentary reward of £1200, besides further remunerations from the Trinity House and from Lloyd's Coffee-house, for his invention of a life-boat, which is described in the *Transactions of the Society*, vol. xx., p. 283. The length of this boat is 30 feet, its breadth, 10, and its greatest depth about 3; besides a general curvature, which nearly doubles the depth, as reckoned from the ends; the convexity below being intended to give it a greater facility of turning, and a greater power of mounting on the waves without submersion of the bow, which would increase the resistance; though it would not sink the boat; the breadth is also continued further than usual fore and aft, in order to contribute to the same property. The gunwale projects some inches; and the sides below it are eased with pieces of cork, amounting in the whole to seven cwt., which are secured by plates of copper. There are ten short oars of fir, fixed on pins to the gunwales, and a longer oar for steering at each end, both ends of the boat being alike. It is painted white, in order to be more conspicuous; and a carriage is provided, for conveying it overland when required. The description is accompanied by documents of the preservation of 200 or 300 men by the boats of South Shields and North Shields, which were built in 1789 and 1798 respectively.

Mr. Christopher Wilson received a gold medal in 1807, for a life-boat with air gunwales, which was tried at Newhaven, and was said to be lighter and more manageable than Mr. Greathead's. (*Transactions*, xxv. 55.) "Little is required," says Captain Manby, "to establish the importance and advantages that will result from giving every boat the properties of a life-boat, particularly when taken into consideration that it can be produced at a very trifling expense." To illustrate the method of giving the properties of preservation to any boat—a man-of-war's jolly-boat, for example—we quote the description of the one which was fitted up to make experiments thereon, by permission of the Honorable Commissioners of the Navy Board. "To give it buoyancy, empty casks were well lashed and secured in it. For the advantage of keeping it in an upright position, launching from a flat shore, beaching, and to resist upsetting, it had billage boards of equal depth with the keel, and when a good sized piece of iron or lead was let into or made fast to the keel, if any accident did upset the boat, it immediately regained its original posture." A stout projecting rope, with swellings upon it to increase its elasticity, surrounded the gunwale, served as a fender, and prevented it being stove in lowering down, or when driven in contact with the vessel it might be going to relieve. The boat thus described had the plug out, and was filled with water until it ran over the gunwale, when a crew of four, with myself, tried it in every way, and found from the buoyant property of the casks, it kept the boat so much above the water's edge, that it was rowed with the greatest ease, and was capable of performing any service required."

Mr. J. Boyce, in 1814, obtained a medal for his life-boat and safety-buoy, consisting of hollow cylinders made of canvas, painted and varnished, and connected with each other. "It was tried on a river, and carried a man with safety (*Trans.*, xxxii., 177); but surely it could not be trusted among breakers on a lee shore.

In 1818 Mr. Gabriel Bray obtained a silver medal for his invention of a boat filled with air-boxes under the seats and along the sides. (*Vol.* xxxv., p. 172.)

Of late years the subject of life-boats has attracted considerable attention, from the circumstance of the increasing number of wrecks, consequent on the rocky nature of many shores, and the vast and increasing amount of our commerce. The exertions, too, of the National Life-Boat Institution have had a powerful influence in directing attention to this subject. This society, founded in 1824, is under the patronage of her majesty; and the presidency of his grace the Duke of Northumberland. The object is to assist every wrecked person in the kingdom, by such means as the establishment of life-boats and rocket-mortars at all the dangerous parts of the coast; to assist in the formation of local committees at the chief ports; to confer rewards in the form of medals, votes of thanks, or pecuniary remuneration to all persons risking their lives for the sake of others; and also to encourage the invention of new or improved life-boats, belts, rocket apparatus, buoys, and other means of saving life. This admirable society is dependent on voluntary subscriptions for its existence and support. That the society has worked with some success, may be judged of from the fact, that since its establishment it has been instrumental in saving the lives of 9682 persons; it has granted 79 gold medallions, and 556 silver medals, besides pecuniary rewards, amounting to £9681. The attention of the public is also kept alive by the publication of a journal entitled *The Life-Boat*, which, in addition to statistical returns of shipwrecks, contains information on every subject connected with the preservation of life from shipwreck. One of the publications of the society is a *Wreck Chart of the British Islands*, originally published by the Admiralty. A vessel wrecked on their coast is indicated by a black spot ●, while a vessel so seriously damaged as to require to discharge her cargo is indicated by †; and the number of such marks at any one spot indicates the annual average of wrecks, which may be large because the coast is dangerous, or because the traffic is great. Thus, the mouth of the Tyne shows a larger number of black dots and crosses than any other place; the mouth of the Tees and the mouth of the Weir occupy the next places of distinction in this dismal chart; these three rivers being the outlets of the district by which London is supplied by sea with 3,000,000 tons of coal every year, giving employment to several thousand collier ships, which sail to and fro, and greatly add to the otherwise large trade of the Northumberland and Durham ports. The coast of these two counties indicates per annum 180 wrecks, sinkings, and serious collisions. The mouth of the Humber, the coast of Suffolk between Yarmouth and Southwold, the sandy shoals off the mouth of the Thames, the Goodwin Sands, the Scilly Isles, Barnstable Bay, and Liverpool, rank as the next dangerous portions of the English coast. The Welsh coast is also dangerous, especially Glamorgan, Pembroke, and Anglesea. Scotland, except near the Firth of Forth, is comparatively free from wrecks, the western coast remarkably so, probably from being less exposed to the winds, which tend to drive ships ashore on the eastern coast. In Ireland, the east and south coasts present about an equal number of wrecks, the smaller number being on the northern and western. In the year 1855 no less than 1141 wrecks occurred on the coasts of the United Kingdom—about one half of that number belonging to the east coasts of Great Britain. The loss of life from shipwreck during that year was comparatively small, being only 469, or less than one third of the loss of the preceding year, the average loss per annum being between 600 and 700 lives.

Passing over a great variety of proposals for life-boats, we proceed to notice the boat which the Life-boat Institution recommends and supplies to its sta-

tions. Its history is interesting. A few years ago, a lamentable accident occurred to a South Shields life-boat, whereby twenty pilots were drowned. This induced the Duke of Northumberland to offer a reward for the best model of a life-boat. This offer was responded to by boat-builders and others from various parts of the kingdom, as well as from France, Holland, Germany, and America, so that 280 models and plans were sent in. About 50 of the best of these were exhibited by his Grace in the Great Exhibition of 1851; and he expressed the intention of placing the best life-boats, with their subsidiary apparatus, on all the exposed points of the coast of Northumberland. He also caused a report to be prepared, accompanied by plans and drawings, with a view to elicit the best form of life-boat; for although the prize of £100 was assigned to Mr. Beeching of Great Yarmouth, it was considered that a better boat might still be produced. Accordingly, Mr. James Peake, assistant master-shipwright in her majesty's dockyard at Woolwich, and a member of the Life-boat Committee appointed by the Duke of Northumberland, was requested to furnish a design for a life-boat which might combine as many as possible of the advantages, and have as few as possible of the defects, of the best of the models examined by the committee. A boat was accordingly designed by Mr. Peake, and built at the public expense in Woolwich dockyard. Some modifications were from time to time made in her, in consequence of various experi-

ments, and a trial of her capabilities made in a gale of wind at Brighton. The boat, with others of the same design, built at the cost of the Duke of Northumberland, was placed on the Northumberland coast in the autumn of 1852. In the course of the following winter, these boats were taken afloat on trial by the Society's inspector of life-boats, some of them in heavy seas and gales of wind, and the result of the trials was considered to be highly satisfactory. Other boats were therefore built on the same plan, and we may therefore consider this as the model life-boat. These boats have been, for the most part, of two sizes, viz., 27 and 30 feet in length, with $7\frac{1}{2}$ to 8 feet beam, and rowing from 8 to 12 oars, double-banked—their weight averaging two tons. But as such boats have been found too heavy to be managed in some localities, where boatmen are few, boats of less beam and weight, rowing six oars single-banked, but on the same design in other respects, have been built under the denomination of second-class life-boats. The former class of boats has also been somewhat modified since the description of the boat was first published, so as to be reduced somewhat in beam, and to have less height, and greater sharpness of bow and stern, to enable them to be rowed with greater speed against a head gale and a heavy sea. They are also built of fir, upon the diagonal principle of double planking without timbers, whereas the earlier boats were of elm, and clenched, or clinker-built.

Fig. 15.

Fig. 16.

The accompanying figures show the general form and the nature of the fittings of the air-chambers of one of these boats, 30 feet in length, and 7 feet 6 inches in breadth. In figs. 15 and 16, corresponding to the elevation and deck-plans, the general exterior form of the boat is seen, showing the sheer of gunwale, length of keel, and rake, or slope of stem and stern posts. The dotted lines of fig. 15 show the position and dimensions of the air-chambers within the board, and of the relieving tubes. A represents the deck, B the relieving tubes,

Fig. 17.

six inches in diameter, C the side air-cases, D the end air-chambers. In fig. 17 the exterior form of transverse sections, at different distances, from stem to stern, is shown. Fig. 18 represents a midship transverse section, A a

ing sections of the side air-cases, B the relieving tubes, bored through solid massive chocks of wood, of the same depth as the space between the deck and the boat's floor; C C are spaces beneath the deck filled up, over six feet in length, at the mid-ship part of the boat, with solid chocks of light wood, or boxes of cork, forming a portion of the ballast; D is a section of a tier below the deck, with a movable hatch or lid, in which the boat's cable is stowed, and into which all leakage beneath the deck is drained through small holes with valves fixed in them. In some of the later boats a small draining tier only is placed, having a pump in it, by which any leakage can be pumped out by one of the crew while afloat. The festooned lines in fig. 15 represent exterior life-lines,

Fig. 18.

attached round the entire length of the boat, to which persons in the water may cling until they can be got into the boat; the two central lines are festooned lower than the others, to be used as stirrups, so that a person in the water, by stepping on them, may climb into the boat.

The chief peculiarity of a life-boat is its incapability of being sunk, in consequence of its being fitted with water-tight air-cases, or compartments. One of the difficulties of life-boats has been to decide as to the amount and distribution of such air-cases. The necessary space for rowing and working the boat, and for the stowage of shipwrecked persons being secured, the space along the sides within-board should be entirely occupied by buoyant cases, or compartments, because, on the boat's shipping a sea, the water, until got rid of, is confined to the midship parts of the boat, where it serves to a great extent as ballast, instead of falling over to the lee-side, and destroying the equilibrium of the boat. Hence, barrels or casks, which do not conform in shape to the sides of the boat, are not well adapted to serve as air-cases. In Mr. Peake's life-boat there is a water-tight deck at the load-water-line, and detached air-boxes along the sides, closely conforming to their shape from the thwarts to the deck. Extra buoyancy is also derived from large air-cases, built across the bow and stern, and occupying from 3 feet to 4½ feet in length, from the stem and stern posts to the gunwale height. These cases are chiefly intended to provide self-righting power; but in the event of the boat being stove in, and the space below the deck being filled with water, these air-cases alone have sufficient buoyancy to float the boat.

The second peculiarity of a life-boat is its power of discharging, in a few seconds, any water which may be shipped by the breaking over of the sea, or by the boat being suddenly thrown on her beam-ends. This property does not belong to all life-boats, for, in certain cases (the Norfolk life-boats, for example) the plugs which stop certain holes in the floors are taken out during a gale of wind, or a heavy sea, so as to let the water into them until it is at the level of the sea. The water thus let in is confined by the wide sea-cases to the midships of the boat, where it serves as a loose ballast, and the boatmen consider that it is safest to go off under sail with the boat deeply immersed. The Liverpool life-boats have no relieving holes, so that when filled by a sea, the water must be got rid of by bailing. In Mr. Peake's boat there is a water-tight deck at the load-water-line, and a number of large open tubes, opening at the surface of the deck, and passing through the space between the deck and the floor; the bottom orifices being furnished with self-acting valves opening downward, so as to allow any water shipped to escape through them. The deck being placed at or above the load-water-line, any water which is above it will be above the outside level of the sea, so that the water escapes from the deck by its own weight, and disappears in a few seconds. As a life-boat has very great buoyant power, it is important to her stability and safety to attend to the ballasting. The Greathead life-boats have usually no ballast, their great breadth of beam being relied on for stability; but some of them have a tank in the midships beneath the deck, which can be filled with water. Beeching's life-boats are similarly ballasted; but accidents, with loss of life, have arisen from a difficulty in filling the tanks, and preventing the escape of the water when full; hence solid ballast is to be preferred. Mr. Peake's life-boats are ballasted with heavy iron keels, and with solid wood and cork ballast, stowed under the decks; and should these be stove in, and the space beneath be filled with water, the wood and the cork would supply extra buoyancy.

A life-boat ought to be self-righting if upset, a property which, however, belongs only to Mr. Peake's and Mr. Beeching's boats, some boat-builders considering

that stability is sacrificed thereby. The fact, however, has been established in the *Life-boat Journal*, that the means employed to produce self-righting add to the stability of a boat, and improve her in other respects. The self-righting power is thus attained: 1. The boat is built with considerable sheer of gunwale, the bow and stern being from 1 foot 6 inches to 2 feet higher than the sides of the boat at her centre, and the space within the boat at either extremity, to the distance of from 3 to 4½ feet from the stem and stern posts to gunwale height, is then inclosed by a sectional bulk-head and a ceiling, and so converted into a water-tight air-chamber, the cubical contents of which, from the thwarts upward, are sufficient to bear the whole weight of the boat when she is placed in the water in an inverted position, or keel upward. 2. A heavy iron keel (from 4 to 8 cwt.) is attached, and a nearly equal weight of light wood or cork ballast is stowed between the boat's floor on the deck. No other measures are necessary to be taken in order to effect the self-righting power. When the boat is forcibly placed in the water with her keel upward, she is floated unsteadily on the two air-chambers at bow and stern; while the heavy iron keel and other ballast being then carried above the centre of gravity, an unstable equilibrium is at once effected, and the weight of the iron keel falling over on one side, immediately restores the boat to her proper position; in other words, she self-rights."—*The Life-boat*, No. 22. Lateral stability or stiffness, being the tendency to preserve an upright position in the water, with proportionate resistance to upsetting, is obtained by breadth of beam or by ballast—as in Mr. Peake's boats, by an iron keel and other solid ballast, and by flatness and length of floor, with moderate beam only. The other qualities to be required in a good life-boat are speed, strength, and stowage-room, all of which seem to have been well considered in Mr. Peake's boats.

A new description of life-boat, invented by the Rev. E. L. Berthon, M.A., of Fareham, and known as the Fareham Life-boat, has been made the subject of a patent. Its novel feature is, that it is collapsible, so that it combines the property of the life-boat, with facility of stowage in a small space. Hence, it is well adapted for the use of ships, especially large steamers, emigrant vessels, and troop-ships. Its frame-work is of wood, all the timbers extending the whole length of the boat, there being no transverse timbers or ribs. The timbers, four on each side of the stem and keel-piece, are thin, flat, and deep, something like a thin slice of melon; they are made without scarfing, by bending plank over plank till the required thickness is attained. They are jointed together at their ends, and to the tops of the stem and stern posts by a kind of chain hinge. When the boat is collapsed, these timbers stand side by side in vertical planes, like the leaves of a closed book; but when expanded, they stand apart in radial planes, somewhat like the segments of an orange. Attached to the edges of all the timbers are water-proof coverings, of which there are two, the outer skin being secured to the outer edges, and the inner skin to the inner edges of the timbers, by which means the whole body of the boat is divided into eight separate longitudinal cells or compartments, which become filled with air on expanding the boat. This is effected and maintained by the bottom boards and thwarts, which being jointed along the middle line, are made to stand up at an acute angle when the boat is collapsed, and fall down to straight lines when open. The inventor compares the principle of extension to that of a carriage-head, the frame of which may be compared to the boat's timbers, and the joints to the thwarts and stretchers of the bottom boards; and as the leathern covering of the carriage shuts in when the head is down, so the coverings of the boat shut in between the timbers. The boat has rather a deep keel, besides two bilge pieces on each side, and

in every other salient point the covering is protected by wood or copper. The boat is lowered by the following contrivance: Inside the bulwarks is a large, flat, deeply-grooved sheave about 2 feet 6 inches in diameter; it has two deep, narrow grooves cut nearly to its axis, and in these are wound separately the ends of the two falls. From this sheave is a projection on which a friction-strap with a powerful lever is made to work. This being placed flat against the bulwarks, the falls are brought to it fore and aft by small sheaves set in the top-rail; thus the friction of the strap, when the boat is up, is enough to prevent motion; but by slacking the lanyard by which the leather is secured, it may be allowed to descend rapidly or slowly, according to the pressure applied to the break. Raising and falling derricks are substituted for davits. The average size of the Fareham life-boat is 32 by 10 feet; it has 8 thwarts, besides seats round the stern, and will pull, if required, 12 oars, double-banked.

Captain Manby's proposal for throwing ropes from ship to ship in cases of accidents may easily be understood from the methods which he employs for saving lives in shipwrecks. The life-buoy by Lieutenant Cook, R.N. F.R.S., Professor of Fortification at Ad-discombe College, is related to the same class of inventions; its object is to preserve the life of a person falling overboard in the night, by means of a floating light; and it obtained him a gold medal from the Society of Arts, in 1818.—*Transactions*, xxxvi. He observes that a ship may often have to run half a mile before she can get about and lower a boat, so that it becomes highly desirable to afford a temporary support to the sufferer. The machine consists of two copper spherical air-vessels, with a square tapering tube through each, made water-tight, and united together by a cross-piece of wood, in which are two brass conducting tubes through which is fixed a perpendicular tubular-staff, with a brass ferule at each end, and a copper sliding-rod, nearly its own length, within it. Attached to the lower end of the rod is a flat circular balance-weight, bearing a chain by which the life-buoy is suspended, and a link which, when hooked to a stud in the lower ferule, bears up the rod and the balance-weight, but which, when unhooked, allows the weight to draw the rod about two thirds-out of the staff. To the head of the perpendicular staff is attached at night a fuse, on a brass fuse-plate, the shank of which is secured in a socket by a thumb-screw. The buoy is secured to the ship by the chain only, the ring of which hangs on the hook of the sheave of the trigger-plate. Attached to the stern of the vessel are two iron rods cased with copper tubing, together with the screw-bolts, from which they are suspended; just above the forked stay which keeps the rods parallel, at a proper distance from the stern, is the trigger-plate, and the brass fuse-case which covers and protects the fuse on the head of the staff. There is also a brass case for the lock or percussion-hammer, placed so as to communicate with the fuse-case, by means of the horizontal tube; all these, together with the pulleys and guard-iron, are firmly attached to the stern of the vessel, inside of which, immediately opposite to the pulleys, are fixed the cups and handles, the one for firing the lock and lighting the fuse, the other for raising the trigger-bolt and disengaging the buoy from the ship. As soon as the trigger-bolt is raised, the sheave revolves, the stop turns round, and the life-buoy slides off the rods into the water, bearing on the head of the staff a brilliant flame. The balance-weight, when no longer held up by the chain, drops upward of three feet below the cross-piece, prevents the buoy from upsetting, and affords a place for the man to stand on. This apparatus admits of being lighted and let down into the water in the short space of five seconds. Lieutenant Cook is also the inventor of a plan for converting boats used for ordinary purposes into life-boats at pleasure.

Mr. Miller's safety-poles for skaters, and Mr. Prior's mode of preventing accidents in descending mines, are mentioned in the *Transactions of the Society of Arts* (vols. xxxii., xxxvi.) Apparatus of the latter kind has been introduced at different times with various modifications. In coal-pits, or coal and iron pits, where the men are raised and lowered in a rectangular iron frame, called a cage, the rope or chain may break, or the cage may be overwound by drawing it over the framing at the pit's mouth. Mr. Robert Blee of Redruth, has introduced what he calls a safety-bucket, and Messrs. White and Grant of Glasgow, have a safety-cage. These inventions depend upon some such arrangements as the following: Two pairs of eccentrics are attached to the ends of two parallel shafts, which extend across the top of the cage; the edges of the eccentrics are toothed, and when the cage is in motion they are free of the vertical wooden rails which steady the cage in its motion up and down the pit. Should the rope break, two volute springs bring round the thick sides of the eccentrics to bear against the guides, and hold the cage securely. To prevent overwinding, the holdfast which connects the rope to the cage is secured by a curved bolt, kept in place by a strong spring; this bolt moves on a fulcrum, and is continued as a lever beyond the holdfast; across the framing at the mouth of the pit is a bar so arranged that, when the lever comes in contact with it, the bolt becomes disengaged, the cage, by the action of the eccentrics, becomes fixed, and the rope only is drawn up over the pulley. In Mr. Blee's safety-cage the catches allow it to move freely so long as there is a vertical strain on them; but should this cease by the breaking of the rope, the catches become liberated, and attached to the iron staves of the ladders placed on either side of the shaft.

A sketch of the expedients which have been recommended for the preservation of mariners, published in a work entitled *Shipwrecks and Disasters at Sea* (vol. iii., Edinburgh, 1822), contains a few further historical details relating to some of the inventions which have been described.—E. B.

Francis's life-boats are very generally used on our American coast, and below we give a short description of them. Many of them are also used in Great Britain. The structure of the boats, and of the wagons may be briefly described. A sheet of galvanized iron or copper of the full size of one half of the boat, from stem to stern, but not thicker than a sixpence, is placed between two dies of the requisite form, and then subjected to enormous hydraulic pressure. The dies require great care, labor, and expense, in their preparation, two being required for each form and size of boat—one for the starboard, and one for the larboard section. The plate of metal is thus pressed into the shape of the half boat, receiving at the same time certain longitudinal, or fore-and-aft corrugations of a peculiar character. The two halves are then riveted together, and the boat is complete.

It is to the corrugations that the boat owes its enormous strength, for it has no frame-work, no ribs, no timbers. A plate of plain metal was exhibited; it was laid on two blocks of wood a yard apart, and was too weak even to bear its own weight. Another plate of metal of the same thickness, but corrugated, was placed on the block, and bore the weight of a man without bending; and would have borne four men. Boats of all sizes may be thus constructed, from the smallest gig to the largest man-of-war's cutter or launch. The great majority of the American steamers have, for some years, carried Francis's boats. In an experiment to test the strength of these boats, one of them was subjected to most violent treatment. It was pitched from a height on stone pavement; it was rolled and bruised upon it, and several men used their utmost endeavors, with heavy hammers, to damage it, but all in vain. It was then set afloat, and four strong men,

pulling with might and main, ran it, stem on, at full speed, to the stone wharf, again and again; but at the close of the experiments, which would have utterly annihilated a wooden boat, it was found to have suffered no damage beyond a few dents and bruises, which a hammar set to rights in five minutes.

The wagons were also experimented upon. The wagon was first placed in the water, with the whole of its running-gear attached, including the pole, the weight, 17 cwt. 16 men then got in, their weight amounting to 25 cwt., and brought the wagon to about one foot from the top. Attempts were then made to upset it in the water, by the whole of the men bearing down, first on one side, and then on the other, but all in vain; the upper edge of the wagon could not be brought below the water. Many other severe experiments were tried. The advantages possessed by an army marching with these wagons, are manifold and self-evident. The cumbrous pontoon and bridge train may be dispensed with, the ordinary wagons which must accompany an army supplying their place. On approaching a river, these wagons, full of men, may at once be driven across the water; or if the stream be full and rapid, the wagon-bodies may be taken off their running-gear, and used as boats, propelled by oars, or dragged by ropes from the opposite bank. Two wagon-bodies put together will float a field-piece, with its limber and ammunition ready for instant action. Four of the bodies make a valuable raft. A succession of them may be anchored across the river, planks laid over them, and a bridge for all arms is at once established. For a more extended account of the losses on the coast of the United States, see WRECKES.

Lighter, a large open flat-bottomed vessel, generally managed with oars, and employed to carry goods to, or from a ship, when she is to be laden or delivered. There are also some lighters furnished with a deck throughout their whole length, in order to inclose such merchandise as would be damaged by rainy weather. These are usually called close lighters.

Light-houses. Light-house, and sea-light, are terms which, although not strictly synonymous, are indifferently employed to denote the same thing. A *Sea-light* may be defined as a *light so modified and directed as to present to the mariner an appearance which shall at once enable him to judge of his position during the night, in the same manner as the sight of a landmark would do during the day.* The early history of light-houses is very uncertain; and many ingenious antiquaries, finding the want of authentic records, have endeavored to supply the deficiency by conjectures founded on casual and obscure allusions in ancient writers, and have invented many vague and unsatisfactory hypotheses on the subject, drawn from the heathen mythology. Some writers have gone so far as to imagine that the Cyclops were the keepers of light-houses; while others have actually maintained that Cyclops was intended, by a bold *prosopopœia*, to represent a light-house itself. A notion so fanciful deserves little consideration; and in order to show how ill it accords with that mythology of which it is intended to be an exposition, it seems enough to quote the lines from the ninth *Odyssey*, where Homer, after describing the darkness of the night, informs us that the fleet of Ulysses actually struck the shore of the Cyclopean island before it could be seen.

Ἐνθ' οὐτις τὴν ἡσσαν ἐσέδρακεν ὀφθαλμοῖσιν
 Οὐτ' οἶν κύματα μακρὰ κυλινδόμενα ποτὶ χέρσων
 Ἐισίδομεν πρὶν ἡῶς εὐσέλμους ἐκτελεσθαι,
Odys., ix., 146.

There does not appear any better reason for supposing, that under the history of Tithonus, Chiron, or any other personage of antiquity, the idea of a light-house was conveyed; for such suppositions, however reconcilable they may appear with some parts of the mythology, involve obvious inconsistencies with

others. Nor does it seem at all probable, that in those early times, when navigation was so little practiced, the advantages of beacon-lights were so generally known and acknowledged as to render them the objects of mythological allegory.

Colossus of Rhodes.—About 800 years before the Christian era, Chares, the disciple of Lysippus, constructed the celebrated brazen statue, called the Colossus of Rhodes, whose height was upward of 100 feet, which stood at the entrance to the harbor. There is considerable probability in the idea that this figure served the purposes of a light-house; but we do not remember any passage in ancient writers, where this use of the Colossus is expressly mentioned. There is much inconsistency in the account of this fabric by early writers, who, in describing distant objects which could be seen from it, appear to have forgotten the height which they assign to the figure. It was partly demolished by an earthquake, about 80 years after its completion; and so late as the year 672 of our era, the brass of which it was composed was sold by the Saracens to a Jewish merchant of Edessa, for a sum, it is said, equal to \$180,000.

Pharos.—Little is known with certainty regarding the Pharos of Alexandria, which was regarded by the ancients as one of the seven wonders of the world. It was built by Ptolemy Philadelphus, about 300 years before Christ; and it is recorded by Strabo, that the architect Sostratus, the son of Dexiphanes, having first secretly cut his own name on the solid walls of the building, covered the words with plaster, and, in obedience to Ptolemy's command made the following inscription on the plaster—"King Ptolemy to the gods, the saviours, for the benefit of sailors." What truth there may be in this account of the fraud of Sostratus there is now no means of determining; and the story is only now interesting, in so far as it shows the object of the royal founder and the use of the tower. The accounts which have reached us of the dimensions of this remarkable edifice are exceedingly various; and many of the statements regarding the distance at which it could be seen are clearly fabulous. Josephus approaches nearest to probability, and informs us, that the fire which was kept constantly burning on the top, was visible by seamen at a distance of about 40 miles. If the reports of some writers are to be believed, this tower must have far exceeded in size the great pyramid itself; but the fact that a building of comparatively so late a date should have so completely disappeared, while the pyramid remains almost unchanged, is a sufficient reason for rejecting, as erroneous, the dimensions which have been assigned by most writers to the Pharos of Alexandria. Some have pretended that large mirrors were employed to direct the rays of the beacon-light on its top, in the most advantageous direction; but there is nothing like respectable evidence in favor of this supposition. Others, with greater probability, have imagined that this celebrated beacon was known to mariners, simply by the uncertain and rude light afforded by a common fire. In speaking of the Pharos, the poet Lucan, on most occasions sufficiently fond of the marvelous, takes no notice of the gigantic mirrors which it is said to have contained.

Septima nox, Zephyro nunquam laxante rudentes,
 Ostendit Pharis Ægyptia littora flammis.
 Sed prius orta dies nocturnam lampada textit,
 Quam tutas intraret aquas. *Pharsal.*, ix., 1004.

It is true that, by using the word "*lampada*," which can only with propriety be applied to a more perfect mode of illumination than an open fire, he appears to indicate that the "*flamma*," of which he speaks, were not so produced. The word *lampada* may, however, be used metaphorically; and *flammis* would, in this case, not improperly describe the irregular appearance of a common fire. Those who are desirous of knowing all that occurs in ancient authors on the subject of the

Pharos of Alexandria, may consult PLINY, l. xxxvi., c. 12; l. v., c. 13, and l. xiii., c. 11. STRABO, l. xvii., p. 791, *et seq.* CÆSAR, *Comment. de Bell. Civil.*, l. iii., Pompon. MELA, l. ii., c. 7. AMMIAN. MARCELLIN, l. xxii., c. 16. JOSEPH. *de Bell. Judic.*, l. vi. NICHOLAS LLOYD's *Lexicon Geographicum*, and the *Notitia Orbis Antiqui*, of Celarius, l. iv., c. 1, p. 13.

Coruña.—Mr. Moore, in his *History of Ireland* (vol. i., p. 16), speaks of the Tower of Coruña, which, he says, is mentioned in the traditionary history of that country as a light-house erected for the use of the Irish in their frequent early intercourse with Spain. In confirmation of this opinion, he cites a somewhat obscure passage from Æthicus, the cosmographer. This in all probability is the tower which Humboldt mentions in his Narrative under the name of the *Iron Tower*, which was built as a light-house by Caius Sævius Lupus, an architect of the city of Aqua Flavia, the modern Chaves. A light-house has lately been established on this headland, for which dioptric apparatus was supplied from the workshop of M. Létourneau of Paris. See also a curious account of the traditions about this tower in SOUTHEY'S *Letters from Spain and Portugal*, p. 17. There is also a record in Strabo, of a magnificent light-house of stone at Capio, or Apio, near the harbor of Menestheus (the modern Mesa Asta, or Puerto de Sta. Maria), built on a rock nearly surrounded by the sea, as a guide for the shallows at the mouth of the Guadalquivir, which he describes in terms almost identical with those used by him in speaking of the Pharos of Alexandria. I am not aware of any other notice of this great work, for such it seems to have been, to have deserved the praises of Strabo. In Camden's *Britannia* a passing notice is taken of the ruins called *Cæsar's Altar*, at Dover, and of the *Tour d'Ordre*, at Boulogne, on the opposite coast; both of which are conjectured, on somewhat doubtful grounds, to have been ancient light-houses. Pennant describes the remains of a Roman Pharos near Holywell, but cites no authorities for his opinion as to its use. There were likewise remains of a similar structure at Flamborough-head. A very meagre and unintelligible account is also given of a light-house at St. Edmund's Chapel, on the coast of Norfolk, in Gough's additions to Camden, by which it might seem that the light-house was erected in 1272.—GOUGH'S CAMDEN'S *Britannia*, vol. i., p. 318, and vol. ii., p. 198. Batcheller, in his *Dover Guide* (1845, p. 111), says, that the Dover Pharos was built "during the lieutenantancy of Aulus Plautius and Ostorius Scapula, the latter of whom left Britain A. D. 53" (PENNANT'S *History of Whiteford and Holywell*, p. 112).

Modern History.—Such seems to be the sum of our knowledge of the ancient history of light-houses, which, it must be admitted, is neither accurate nor extensive. Our information regarding modern light-houses is of course more minute in its details, and more worthy of credit, as the greater part of it is drawn from authentic sources, or is the result of the actual observation of the writer of this article, who has visited the most important light-houses of Europe. It seems sufficient here to notice briefly the most remarkable establishments of the kind now in existence; reserving, for the latter part of the article, the more appropriate and important topics of the methods of illumination, and the systems of management. The first light-house of modern days which merits attention is the Tour de Corduan, which, in point of architectural grandeur, is unquestionably the noblest edifice of the kind in the world. It is situate on an extensive reef at the mouth of the River Garonne, and serves as a guide to the shipping of Bordeaux and the Languedoc Canal, and, indeed, of all that part of the Bay of Biscay. It was founded in the year 1584, and was not completed till 1610, under Henri IV. It is minutely described in Belidor's *Architecture Hydraulique*. The building is

197 feet in height, and is shown in the accompanying woodcut, fig. 1. Round the base is a wall of circumvallation, 134 feet in diameter, in which the light-

FIG. 1. TOUR DE CORDUAN.

keeper's apartments are formed, somewhat in the style of casemates. The first light exhibited in the Tour de Corduan was obtained by burning billets of oak wood, in a chaffier at the top of the tower; and the use of coal instead of wood was the first improvement which the light received. A rude reflector, in the form of an inverted cone, was afterwards added, to prevent the loss of light which escaped upward. About the year 1780, M. Lenoir was employed to substitute reflectors and lamps; and in 1822 the light received its last improvement, by the introduction of the dioptric instruments of M. Fresnel.—*History of Celebrated Light-houses*.

Eddystone.—The history of the celebrated light-house on the Eddystone rocks, is well known to the general reader, from the narrative of Mr. Smeaton the engineer. These rocks are $9\frac{1}{2}$ miles from the Ram-head, on the coast of Cornwall; and from the small extent of the surface of the chief rock, and its exposed situation, the construction of the light-house was a work of very great difficulty. The first erection was of timber, designed by Mr. Winstanley, and was commenced in 1696. The light was exhibited in November, 1698. It was soon found, however, that the sea rose upon this tower to a much greater height than had been anticipated, so much so, it is said, as to "bury under the water" the lantern, which was 60 feet above the rock; and Mr. Winstanley was therefore afterward under the necessity of enlarging the tower, and carrying it to the height of 120 feet. In Novem-

ber, 1708, some considerable repairs were required, and Mr. Winstanley, accompanied by his workmen, went to the light-house to attend to their execution; but the storm of the 26th of that month carried away the whole erection, when the engineer and all his assistants unhappily perished.

The want of a light on the Eddystone soon led to a fatal accident; for, not long after the destruction of Mr. Winstanley's light-house, the *Winchelsea* man-of-war was wrecked on the Eddystone rocks, and most of her crew were lost. Three years, however, elapsed after this melancholy proof of the necessity of a light before the Trinity House of London could obtain a new act to extend their powers; and it was not till the month of July, 1706, that the construction of a new light-house was begun, under the direction of Mr. John Rudyerd of London. On the 28th of July, 1708, the new light was first shown, and continued to be regularly exhibited till the year 1755, when the whole fabric was destroyed by accidental fire, after standing 47 years. But for this circumstance, it is impossible to tell how long the light-house might, with occasional repair, have lasted, as Mr. Rudyerd seems to have executed his task with much judgment, carefully rejecting all architectural decoration, as unsuitable for such a situation, and directing his attention to the formation of a tower which should offer the least resistance to the waves. The height of the tower, which was of a circular form, and constructed of timber, was, including the lantern, 92 feet, and the diameter at the base, which was a little above the level of high water, was 23.

Fig. 2. EDDYSTONE LIGHT, CORNWALL.

The advantages of a light on the Eddystone having been so long known and acknowledged by seamen, no time was permitted to elapse before active measures were taken for its restoration; and Mr. Smeaton, to whom application was made for advice on the subject, recommended the exclusive use of stone as the material, which, both from its weight and other qualities, he considered most suitable for the situation. On the 5th of April, 1756, Mr. Smeaton first landed on the rock, and made arrangements for erecting a light-house of stone, and preparing the foundations, by cutting

the surface of the rock into regular horizontal benches, into which the stones were carefully dovetailed or notched. The first stone was laid on 12th June, 1757, and the last on the 24th of August, 1759. The tower measures 68 feet in height, and 26 feet in diameter at the level of the first entire course, and the diameter under the cornice is 15 feet. The first 12 feet of the tower form a solid mass of masonry, and the stones are united by means of stone joggles, dovetailed joints, and oak treenails. It is remarkable that Mr. Smeaton should have adopted an arched form for the floors of his building, instead of employing these floors as tie-walls formed of dovetailed stones. To counteract the injurious tendency of the outward thrust of the arched floors, Mr. Smeaton had recourse to the ingenious expedient of laying, in circular trenches or beds in the stones which form the outside casing, sets of chains, which were heated by means of an application of hot lead, and became tight in cooling. The light was exhibited on the 16th October, 1759; but such was the state of the light-room apparatus in Britain at this period, that a feeble light from tallow candles was all that decorated this noble structure. In 1807, when the property of this light-house again came into the hands of the Trinity House, on the expiry of a long lease, Argand burners, and parabolic reflectors of silvered copper, were substituted for the chandelier of candles. Figure 2 shows a section of the Eddystone light-house, as executed according to Mr. Smeaton's design.

Bell-Rock.—The dangerous reef called the Inch Cape, or Bell-Rock, so long a terror to mariners, was well known to the earliest navigators of Scotland. Its dangers were so generally acknowledged, that the Abbots of Aberbrothick, from which the rock is distant about 12 miles, caused a float to be fixed upon the rock, with a bell attached to it, which, being swung by the motion of the waves, served by its tolling to warn the mariner of his approach to the reef. Among the many losses which occurred on the Bell-Rock in modern times, one of the most remarkable is that of the *York*, 74, with all her crew, part of the wreck having been afterward found on the rock, and part having come ashore on the neighboring coast. During the survey of the rock also, many instances were discovered of the extent of loss which this reef had occasioned, and many articles of ships' furnishings were picked up on it, as well as various coins, a bayonet, a silver shoe-buckle, and many other small objects. Impressed with the great importance of some guide for the Bell-Rock, Captain Brodie, R.N., set a small subscription on foot, and erected a beacon on spars on the rock, which, however, was soon destroyed by the sea. He afterward constructed a second beacon, which soon shared the same fate. It was not, however, until 1802, when the Commissioners of Northern Lights brought a bill into Parliament for power to erect a light-house on it, that any efficient measures were contemplated for the protection of seamen from this rock, which, being covered at every spring-tide to the depth of 12 feet, and lying right in the fareway to the Firths of Forth and Tay, had been the occasion of much loss both of property and life. In 1806 the bill passed into a law, and various ingenious plans were suggested for overcoming the difficulties which were apprehended, in erecting a light-house on a rock 12 miles from land, and covered to the depth of 12 feet by the tide. But the suggestion of Mr. Robert Stevenson, the engineer to the Light-house Board, after being submitted to the late Mr. Rennie, was at length adopted; and it was determined to construct a tower of masonry, on the principle of the Eddystone. On the 17th of August, 1807, Mr. Stevenson accordingly landed with his workmen, and commenced the work by preparing the rock to receive the supports of a temporary wooden pyramid, on which a barrack-house, for the reception of the workmen, was to be placed; and during

this operation much hazard was often incurred in transporting the men from the rock, which was only dry for a few hours at spring-tides, to the vessel which lay moored off it. The lowest floor of this temporary erection, in which the mortar for the building was prepared, was often broken up and removed by the force of the sea. The foundation having been excavated, the first stone was laid on the 10th July, 1808, at the depth of 16 feet below the high-water of spring-tides, and at the end of the second season, the building was 5 feet 6 inches above the lowest part of the foundation. The third season's operations terminated by finishing the solid part of the structure, which is 30 feet in height; and the whole of the masonry was completed in October, 1810. The light was first exhibited to the public on the night of the 1st of February, 1811. The difficulties and hazards of this work were chiefly caused by the short time during which the rock was accessible between the ebbing and flowing tides; and among the many eventful incidents which rendered the history of this work interesting, was the narrow escape which the engineer and 31 persons made from being drowned, by the rising of the tide upon the rock, before a boat came to their assistance, the attending vessel having broken adrift. This circumstance occurred before the barrack-house was erected, and is narrated by Mr. Stevenson in his account of the work, published at the expense of the Light-house Board in 1824, to which we may refer for more minute information on the subject of this work, and the other lights of the coast of Scotland.

Fig. 8. BELL-ROCK LIGHT, SCOTLAND.

The Bell-Rock tower is 100 feet in height, 42 feet in diameter at the base, and 15 at the top. The door is 30 feet from the base, and the ascent is by a massive copper ladder. The apartments, including the light-room, are six in number. The light is a revolving

red and white light, and is produced by the revolution of a frame containing 20 Argand lamps, placed in the foci of parabolic mirrors, arranged on a quadrangular frame, whose alternate faces have shades of red glass placed before the reflectors, so that a red and white light is shown successively. The machinery, which causes the revolution of the frame containing the lamps, is also applied to tolling two large bells, to give warning to the mariner of his approach to the rock in foggy weather. Fig. 3 shows a section of the Bell-Rock Light-house, and of the temporary barrack-house, which was removed on the completion of the work. The entire cost of the light-house was over £61,331. The great merit of Mr. Stevenson, as architect of the Bell-Rock Light-house, lies in his bold conception and unshaken belief in the possibility of erecting a tower of masonry on a reef 12 miles from the nearest land, and covered by every tide—a situation, undoubtedly, much more difficult than that of the Eddystone. But his mechanical skill in carrying on the work is also deserving of high praise. Not only did he conceive the plan of the *movable jib and balance cranes*, which he afterward used with much advantage in building the tower; but his zeal, ever alive to the possibility of improving on the conceptions of his great master Smeaton, led him to introduce several beneficial changes into the arrangements of the masonry. In particular, he converted the stone floors of the apartments, which in the Eddystone exert an *outward*, and in its tendency disruptive, thrust, into bonds of union and efficient sources of stability. This thrust was by Smeaton himself considered so disadvantageous, that he thought fit to counteract it, as already noticed, by means of metallic *girders*, concealed in the stone-work, and most ingeniously applied. The Light-house Board placed in the upper apartment of the tower a bust of Mr. Stevenson, "in testimony," as the minutes record, "of the sense entertained by the Commissioners of his distinguished talent and indefatigable zeal in the erection of the Light-house."

The most remarkable light-house on the coast of Ireland is that of Carlingford, near Cranfield Point, at the entrance of Carlingford Lough. It was built according to the design of Mr. George Halpin, the Inspector of the Irish Lights; and was a work of an arduous nature, being founded 12 feet below the level of high-water on the Hawlbowl Rock, which lies about two miles off Cranfield Point. The figure is that of a frustum of a cone, 111 feet in height, and 48 feet in diameter at the base. The light, which is fixed, is from oil burned in Argand lamps placed in the foci of parabolic mirrors. It was first exhibited on the night of the 20th December, 1830.

Skerryvore Rocks.—The Skerryvore Rocks, which lie about 12 miles W.S.W. of the seaward point of the Isle of Tyree, in Argyleshire, were long known as a terror to mariners, owing to the numerous shipwrecks, fatal alike to the vessels and the crews, which had occurred in the neighborhood. A list, confessedly incomplete, enumerates 30 vessels lost in the 40 years preceding 1844; but how many others, which during that period had been reported as "foundered at sea," or as to whose fate not even an opinion has been hazarded, may have been wrecked on this dangerous reef, which lies so much in the track of the shipping of Liverpool and the Clyde, it would be vain to conjecture. The Commissioners of the Northern Light-houses had for many years entertained the project of erecting a light-house on the Skerryvore; and with this object had visited it, more especially in the year 1814, in company with

Sir Walter Scott, who, in his diary, gives a graphic description of its inhospitable aspect. The great difficulty of landing on the rock, which is worn smooth by the continual beat of Atlantic waves, which rise with undiminished power from the deep water near it, held out no cheering prospect; and it was not until the year 1884, when a minute survey of the reef was ordered by the Board, that the idea of commencing this formidable work was seriously embraced.

cutting of the foundation for the tower in this irregular flinty mass occupied nearly two summers; and the blasting of the rock, in so narrow a space, without any shelter from the risk of flying splinters, was attended with much hazard.

The design for the Skerryvore Light-house was given by Mr. Alan Stevenson, and is an adaptation of Smeaton's Eddystone Tower to the peculiar situation and the circumstances of the case at the Skerryvore, with such modifications in the general arrangements and dimensions of the building as the enlarged views of the importance of light-houses which prevail in the present day seemed to call for.

The tower is 138 feet 6 inches high, and 42 feet in diameter at the base, and 16 feet at the top. It contains a mass of stone-work of about 58,580 cubic

feet, or more than *double* that of the Bell-Rock, and not much less than *five times* that of the Eddystone. The lower part of the tower was built by means of *jib-cranes*, and the upper part with *shear-poles*, *needles*, and a *balance-crane*. The shear-poles were similar to those used by Smeaton at the Eddystone; and the *jib-crane* and *balance-crane* were the same as those which were designed and first employed by Mr. Robert Stevenson in the erection of the Bell-Rock Light-house. The mortar used was compounded of equal parts of limestone (from the Halkin Mountain, near Holywell, in North Wales), burnt and ground at the works, and of Pozzolano earth. The light of Skerryvore is revolving, and reaches its brightest state *once every minute*. It is produced by the revolution of eight great annular lenses around a central lamp with four wicks, and belongs to the first order of dioptric lights in the system of Fresnel. The light may be seen from a vessel's deck at the distance of 18 miles. The entire cost of the light-house, including the purchase of the steam-vessel, and the building of the harbor at Hynish for the reception of the small vessel which now attends the light-house, was £86,977, 17s. 7d.

"In such a situation as the Skerryvore," says the engineer, "innumerable delays and disappointments were to be expected by those engaged in the work; and the entire loss of the fruit of the first season's labor in the course of a few hours was a good lesson in the school of patience, and of trust in something better than an arm of flesh. During our progress, also, cranes and other materials were swept away by the waves; vessels were driven by sudden gales to seek shelter at a distance from the rocky shores of Mull and Tyree; and the workmen were left on the rock desponding and idle, and destitute of many of the comforts with which a more roomy and sheltered dwelling, and the neighborhood of friends, are generally connected. Daily risks were run in landing on the

rock in a heavy surf, in blasting the splintery gneiss, or by the falling of heavy bodies from the tower on the narrow space below, to which so many persons were necessarily confined. Yet had we not any loss of either life or limb; and although our labors were prolonged

from dawn to night, and our provisions were chiefly salt, the health of the people, with the exception of a few slight cases of dysentery, was generally good throughout the six successive summers of our sojourn on the rock. The close of the work was welcomed with thankfulness by all engaged in it; and our remarkable preservation was viewed, even by many of the most thoughtless, as, in a peculiar manner, the gracious work of Him by whom 'the very hairs of our heads are all numbered.'"

There can be little doubt that, down to a very late pe-

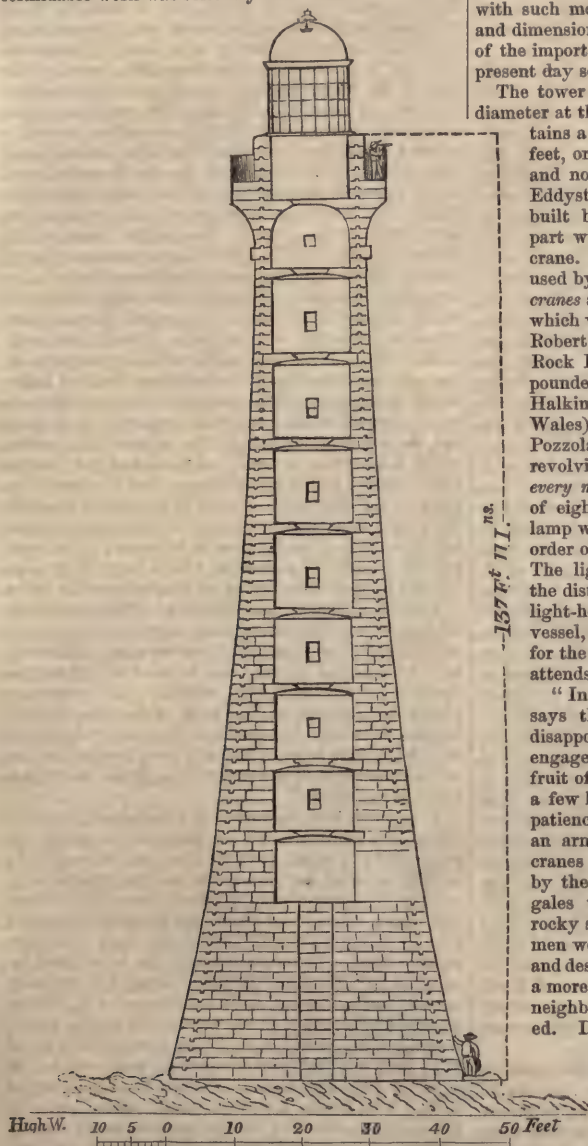

Fig. 4. SKERRYVORE LIGHT.

The reef is composed of numerous rocks, stretching over a surface of nearly eight miles from W.S.W. to E.N.E. The main *nucleus*, which alone presents sufficient surface for the base of a light-house, is nearly three miles from the seaward end of the cluster. It is composed of a very compact *gneiss* worn smooth as glass by the incessant play of the waters, and is so small that at high-water little remains around the base of the tower but a narrow band of a few feet in width, and some rugged humps of rock, separated by gullies, through which the sea plays almost incessantly. The

riod, the only mode of illumination adopted in the light-houses, even of the most civilized nations of Europe, was the combustion of wood or coal in a chauffer on the top of a high tower. It is needless to enlarge upon the evils of such a method; they need only be named to be understood; for it is difficult to conceive how an efficient system of lighting a coast could be managed under such disadvantages. The uncertainty caused by the effects of wind and rain, and the impossibility of rendering one light distinguishable from another, must have at all times rendered the early light-houses in a great measure useless to the mariner.

Catoptric System.—M. Teulère, a member of the Royal Corps of Engineers of Bridges and Roads in France, is, by some, considered the first who hinted at the advantages of parabolic reflectors; and he is said, in a memoir dated the 26th June, 1783, to have proposed their combination with Argand lamps, ranged on a revolving frame, for the Corduan Light-house. Whatever foundation there may be for the claim of M. Teulère, certain it is, that this plan was actually carried into effect at Corduan under the directions of the Chevalier Borda, and to him is generally awarded the merit of having conceived the idea of applying parabolic mirrors to light-houses. These were prodigious steps in the improvement of light-houses, as not only the power of the lights was thus greatly increased, but the introduction of a revolving frame proved a valuable source of distinction among the lights, and has since been the means of greatly extending their utility. The exact date of the change on the light of the Corduan is not known; but as it was made by Lenoir, the same young artist to whom Borda, about the year 1780, intrusted the construction of his reflecting circle, it has been conjectured by some that the improvement was made about the same time. If this conjecture be correct, the claim of M. Teulère must of course fall to the ground. The reflectors were formed of sheet copper, plated with silver, and had a double ordinate of 31 French inches. It was not long before these improvements were adopted in England by the Trinity House of London, who sent a deputation to France to inquire into their nature. In Scotland, one of the first acts of the Northern Lights Board, in 1786, was to substitute reflectors in the room of coal lights, then in use at the Isle of May in the Firth of Forth, and the Cumbrae Isle in the Firth of Clyde, which had, till that period, been the only beacons on the Scotch coast. The reflectors employed were formed of facets of mirror glass, placed in hollow parabolical molds of plaster, according to the designs of the late Mr. Thomas Smith, the Engineer of the Board, who, as appears from the article REFLECTOR in the Supplement to the 8d edition of the *Encyclopædia Britannica*, was not aware of what had been done in France, and had himself conceived the idea of this combination. The system of Borda was also adopted in Ireland; and, in time, variously modified, it became general wherever light-houses were known.

Paraboloidal Mirrors.—The property of the parabola, by which all lines incident on its surface from the focus make with normals to the curve at the points of incidence, angles equal to the inclination of these same normals respectively to lines drawn parallel to the axis of the curve, is that which fits it for the purposes of a light-house. A hollow mirror, formed by the revolution of a portion of a parabola about its axis, has, in consequence of this property, the power of projecting the repeated images of a luminous point placed in its focus, in directions parallel to the axis of the generating curve; so that, when the mirror is placed with its axis parallel to the horizon, a cylindrical beam of light is thereby sent forward in a horizontal direction. When such mirrors are placed side by side, with their axis parallel on the faces of a quadrangular frame which revolves about a vertical axis, a distant ob-

server receives the successive impressions which result from the passage of each face of the frame, over a line drawn between the observer's eye and the centre of the revolving frame. This arrangement constitutes what is called a revolving light. A fixed light is produced by placing, side by side, round a circular frame, a number of reflectors, with their axes inclined to each other, so as to be radii containing equal arcs of the frame on which they are placed. It is obvious that a perfect parabolic figure, and a luminous point mathematically true, would render the illumination of the whole horizon by means of a fixed light impossible; and it is only from the aberration caused by the size of the flame which is substituted for the point, that we are enabled to render even revolving lights practically useful. But for this aberration, even the slowest revolution in a revolving light, which would be consistent with a continued observable series, such as the practical seaman could follow, would render the flashes of a revolving light greatly too transient for any useful purpose; while fixed lights, being visible in the azimuths only in which the mirrors are placed, would, over the greater part of the distant horizon, be altogether invisible. The size of the flame, therefore, which is placed in the focus of a parabolic mirror, when taken in connection with the form of the mirror itself, leads to those important modifications in the paths of the rays, and the form of the resultant beam of light, which have rendered the catoptric system of lights so great a benefit to the benighted seaman. It is obvious, from a consideration of the nature of the action which takes place in this combination of the paraboloidal mirrors with Argand lamps, that the revolving light is not only more perfect in its nature than the fixed light, but that it possesses the advantage of being susceptible of an increase of its power, by increasing the number of reflectors, which have their axes parallel to each other, so as to concentrate the effect of several mirrors in one direction. The perfect parallelism of the axes of separate mirrors, it is true, is unattainable, but approaches may be made sufficiently near for practical results; and in order to prolong the duration of the flash, the reflectors are sometimes placed on a frame, having each of its sides slightly convex, by which arrangement the outer reflectors of each face of the frame have their axes less inclined inwards from the radii of the revolving frame which pass through their foci.

Proportions and Divergence of Paraboloidal Mirrors.

—The best proportions for the paraboloidal mirrors depend upon the object to which they are to be applied; as mirrors which are intended to produce great divergence in the form of the resultant beam should have one form; while those which are designed to cause a near approach to parallelism of the rays will have another form. These objects may also be attained by variations of the size of the flame applied in the same mirror; but it is much more advantageous to produce the effect by a change in the form of the mirror, as any increase of the flame beyond the size which is found to be most advantageous in other respects can not be regarded otherwise than as a wasteful expenditure of light. The details into which a full investigation of this matter would lead us are quite beyond the scope of this article, and it therefore seems sufficient to give the formulæ which express the relations which exist between the size of the flame, the reflecting surface, and the corresponding divergence of the reflected ray. If Δ represent the inclination of any reflected ray to the axis of a paraboloidal mirror, e the distance of the focus from the point of reflection, and d the distance from the edge of the flame to the focus in the

plane of reflection, we shall have $\sin \Delta = \frac{d}{e}$; and when the flame in the given plane of reflection is circular, or has its opposite sides equidistant from the focus of

the mirror, we shall, by putting Δ' for the effective divergence of the mirror have in the given plane, $\Delta' = 2\Delta$. When, therefore, great divergence, as in the case of the fixed lights, is required, the prolate form of the curve is to be preferred; and the oblate is conversely more suited to revolving lights.

Power of Paraboloidal Mirrors.—The power of the reflectors ordinarily employed in light-houses is generally equal to about 360 times the effect of the unassisted flame which is placed in the focus. This value, however, is strictly applicable only at the distances at which the observations have been made, as the proportional value of the reflected beam must necessarily vary with the distance of the observer, agreeably to some law dependent upon the unequal distribution of the light in the luminous cone which proceeds from it. The ordinary burners used in light-houses are one inch in diameter, and the focal distance generally adopted is 4 inches, so that the effective divergence of the mirror in the horizontal plane may be estimated at about $14^\circ 22'$. In arranging reflectors on the frame of a fixed light, however, it would be advisable to calculate upon less effective divergence, for beyond 11° the light is feeble; but the difficulty of placing many mirrors on one frame, and the great expense of oil required for so many lamps, have generally led to the adoption of the first valuation of the divergence.

Manufacture and testing of Reflectors.—The reflectors used in the best light-houses are made of sheet copper plated, in the proportion of 6 oz. of silver to 16 oz. of copper. They are molded to the paraboloidal form by a delicate and laborious process of beating with mallets and hammers, of various forms and materials, and are frequently tested during the operation by the application of a carefully-formed mold. After being brought to the curve, they are stiffened by means of a strong beazle, and a strap of brass, which is attached to it for the purpose of preventing any accidental alteration of its figure. Polishing powders are then applied, and the instrument receives its last finish. Two gauges of brass are applied to test the form of the reflector. One is for the back, and is used by the workmen during the process of hammering, and the other is applied to the concave face as a test, while the mirror is receiving its final polish. It is then tested, by trying a burner in the focus, and measuring the intensity of the light at various points of the reflected conical beam. Another test may also be applied successively to various points in the surface, by masking the rest of the mirror. Having placed a screen in the line of the axis of the mirror at some given distance from it, it is easy to find whether the image of a very small object placed in the conjugate focus, which is due to the distance of the screen, be reflected at any distance from that point on the centre of the screen through which the prolongation of the axis of the mirror would pass, and thus to obtain a measure of the error of the instrument. For this purpose it is necessary to find the position of the conjugate focus, which corresponds to the distance of the screen. If b be the distance which the object should be removed outward from the principal focus of the mirror, d the distance from the focus to the screen, and r the distance from the focus to the point of the

mirror which is to be tested, we shall have $b = \frac{r^2}{d}$ as

the distance which the object must be removed outward from the true focus on the line of the axis.

Argand Lamps.—The flame generally used in reflectors is from an Argand fountain-lamp, whose wick is an inch in diameter. Much care is bestowed upon the manufacture of these lamps for the Northern Light-houses, which have their burners tipped with silver, to prevent wasting by the great heat which is evolved. These burners are also fitted with a slide apparatus, accurately formed, by which the burner

may be removed from the interior of the mirror at the time of cleaning it, and returned exactly to the same place, and locked by means of a key. This arrangement, which is shown

in figures 5, 6, and 7, is very important, as it insures the burner always being in the focus, and does not require the reflector to be lifted out of its place every time it is cleaned; so that, when once carefully set and screwed down to the frame, it is never altered. In these figs. *aaa* represents one of the reflectors, *b* is the lamp, *c* is a cylindric fountain, which contains 24 oz. of oil. The oil-pipe and fountain of the former is connected with

the rectangular frame *d*, and is movable in a vertical direction upon the guide-rods *e* and *f*, by which it can be let down and taken out of the reflector by simply turning the handle *g*, as will be more fully understood by examining fig. 6.

An aperture of an elliptical form, measuring about 2 inches by 3, is cut in the upper and lower part of the reflector, the lower serving for the free egress and ingress of the lamp, and the upper, to which the copper tube *h* is attached, serving for ventilation; *i* shows a cross section of the main bar of the chandelier or frame, on which the reflectors are ranged, each being made to rest on knobs of brass, one of which is seen at *kk*, and which are soldered on the brass band *l*, that clasps the exterior of the reflector.

Fig. 5 is a section of the reflector *aa*, showing the position of the burner *b*, with the glass chimney *b'*, and oil-cup *l*, which receives any oil that may drop from the lamp.

Fig. 6 shows the apparatus for moving the lamp up and down, so as to remove it from the reflector at the time of cleaning it. In the diagram, *c*, the fountain is moved partly down; *dd*

Fig. 5.

Fig. 6.

Fig. 7.

shows the rectangular frame on which the burner is mounted, *e*, the elongated socket-guides, *f* the rectangular guide-rod, connected with the perforated sockets on which the checking-handle *g* slides.

Arrangement of Reflectors on the frame.—The modes of arranging the reflectors in the frames are shown in figs. 8, 9, and 10. It seems quite unnecessary, after what is said on the subject of divergence, to do more than remark, that in revolving lights the reflectors are placed with their axes parallel to each other, so as to concentrate their power in one direction; while in fixed lights it is necessary, in order to effect as equal a distribution of the light over the horizon as possible, to place the reflectors, with their axes inclined to each other at an angle somewhat less than that of the divergence of the reflected cone. For this purpose a brass guage, composed of two long arms, somewhat in the form of a pair of common dividers, connected by means of a graduated limb, is employed. The arms having been first placed at the angle, which is supplemental to that of the inclination of the axes of the two adjacent mirrors, are made to span the faces of the reflectors, one of which is moved about till its edges are in close contact with the flat surface of one of the arms of the guage. The different arrangements of the reflectors will be more fully understood by referring to the figures.

Fig. 8.

Fig. 8 shows an elevation of a revolving apparatus on the catoptric principle. In these figures, *nm*, shows the reflector frame or chandelier; *o, o*, the reflectors with their oil-fountains, *p, p*. The whole is attached to the revolving axis or shaft *q*. The copper tubes, *r, r*, convey the smoke from the lamps; *s, s* are cross bars which support the shaft at *tt*; *un* is a copper pan for receiving any moisture which may accidentally enter at the central ventilator in the roof of the light-room; *l* is a cast-iron bracket, which supports the pivot on the shaft; *m, m* are beveled wheels, which convey motion from the machine to the shaft. Fig. 9 shows a plan of one tier of reflectors arranged in the manner employed in a fixed catoptric light; *nm* shows the

chandelier, *q* the fixed shaft in the centre, which supports the whole, *o, o* the reflectors, and *p, p* the fountains of their lamps.

Fig. 9.

To the Dutch belongs the honor of having first, after the French, embraced the system of Fresnel in their lights. The Commissioners of the N. British Lights followed in the train of improvement, and, in 1834, sent Mr. Alan Stevenson on a mission to Paris, with full power to take such steps for acquiring a perfect knowledge of the dioptric system, and forming an opinion on its merits, as he should find necessary. The singular liberality with which he was received by M. Léonor Fresnel, brother of the late illustrious inventor of the system, and his successor as the Secretary of the Light-house Commission of France, afforded Mr. A. Stevenson the means of making such a report on his return as induced the Commissioners to authorize him to remove the reflecting apparatus of the revolving light at Inchkeith, and substitute dioptric instruments in its place. This change was completed, and the light exhibited on the evening of 1st October, 1835; and so great was the satisfaction which the change produced, that the Commissioners immediately instructed Mr. Stevenson to make a similar change at the fixed light of the Isle of May, where the new light was exhibited on the 22d September, 1836. The Trinity House of London followed next in adopting the improved system, and employed Mr. A. Stevenson to superintend the construction of a revolving dioptric light of the first order, which was afterward erected at Start Point in Devonshire. Other countries followed, and the *Report of the Light-house Board of America*, published in 1852, which recommends (see page 1229 of this article) the adoption of Fresnel's dioptric system, and the holophotal improvements, is a very full body of information on light-house subjects, extending over about 750 pages. Even Turkey has followed in the train of improvement, and we believe that a light on the dioptric principle will shortly be exhibited (if it be not already completed) from the Isle of Serpents. Fresnel, who is already classed with the greatest of those inventive minds which extend the boundaries of human knowledge, will thus, at the same time, receive a place among those benefactors of the species who have consecrated their genius to the common good of mankind; and, wherever maritime intercourse prevails, the solid advantages which his labors have procured will be felt and acknowledged.

When, however, this system was in its infancy, there were several objections raised to its adoption, which appeared to be of very considerable importance, though the experience of years has proved that they are not insurmountable. The first, and probably the

most important, was the liability of the lamp to be extinguished from the failure of the leather work of the oil-pumps—a most serious objection, inasmuch as, from there being only one lamp, its failure implies the extinction of the light. The means adopted to remedy this have been already described (*vide* “mechanical lamp”), and an experience of 21 years in the Northern Light-houses has proved them to be sufficient for the purpose; for during the whole of that time (although it has on several occasions been necessary to light the spare lamp), the light has only on one occasion been totally extinguished, a casualty which was caused by the keeper sleeping on his watch.

The only other objection worthy of mention is the short duration of the flash in revolving lights, owing to the small divergence ($5^{\circ} 9'$) of the annular lens. This has been corrected by setting the inclined mirrors, or holophotal prisms, a little in advance of the great lenses, so that they precede, and consequently prolong, the principal flash. M. Degrand has also proposed to cut the whole apparatus by a horizontal plane passing through the focus, and to set one portion a few degrees in advance of the other, a plan which has considerable advantages, as all the portions of the beam are more nearly of equal intensity.

Spherico-Cylindric Lenses.—Mr. T. Stevenson, moreover, suggests an ingenious method of remedying this evil, by constructing lenses whose aberration in the vertical plane is corrected, while that in the horizontal plane may be adjusted to any determinate amount. In the application of this method of construction to the annular lenses they would be ground on the external surface as before; but the internal surface would be a portion of a vertical cylinder of suitable radius. Thus each vertical section would be similar to that of a plano-convex lens as at present, and would refract the rays accordingly, while the horizontal sections would be of a meniscus form, and would act only by the excess of their convexity over their concavity. Thus, by varying the radius of the cylinder, any amount of horizontal divergence may be obtained, and this without much increasing the thickness of the glass, at least in the case of revolving lights, in which a curve of long radius might be applied.

Fuel of Light-houses.—The oil, until lately, most generally employed in the light-houses of the United Kingdom, was the sperm oil of commerce, which is obtained from the South Sea whale (*Physeter macrocephalus*). In France, the colza oil, which is expressed from the seed of a species of wild cabbage (*Brassica oleracea colza*), and the olive oil, are chiefly used; and a species of the former has now been successfully introduced into the British light-houses. The advantages of the colza oil are thus stated by the engineer of the Scottish Light-house Board:—“It appears from pretty careful photometrical measurements of various kinds, that the light derived from the colza oil is, in point of intensity, a little superior to that derived from the spermaceti oil, being in the ratio of 1.056 to 1. The colza oil burns both in the Fresnel lamp and the single Argand burner with a thick wick during 17 hours, without requiring any coaling of the wick or any adjustment of the damper; and the flame seems to be more steady and freer from flickering than that derived from spermaceti oil. There seems (most probably owing to the greater steadiness of the flame), to be less breakage of glass chimneys with the colza than with the spermaceti oil. The consumption of oil seems in the Fresnel lamp to be 121 for colza, and 114 for spermaceti; while in the common Argand, the consumption appears to be 910 for colza, and 902 for spermaceti; and if we assume the means of these numbers, 515 for colza, and 508 for spermaceti, as representing the relative expenditure of these oils; and if the price of colza be 8s. 9d., while that of spermaceti is 6s. 9d. per imperial gallon; we shall have a saving in the ratio of 1 to 1.755, which, at the present

rate of supply for the Northern Lights, would give a saving of about £3266 per annum.”

Gas.—In a few light-houses which are near towns, the gas of pit coal has been used, and there are certain advantages, more especially in dioptric lights, where there is only one large central flame, which would render the use of gas desirable. The form of the flame, which is an object of considerable importance, would thus be rendered less variable, and could be more easily regulated, and the inconvenience of the clock-work of the lamp would be wholly avoided. But it is obvious that gas is by no means suitable for the majority of light-houses, their distant situation, and generally difficult access, rendering the transport of large quantities of coal expensive and uncertain; while in many of them there is no means of erecting the apparatus necessary for manufacturing gas. There are other considerations which must induce us to pause before adopting gas as the fuel of light-houses; for, however much the risk of accident may be diminished in the present day, it still forms a question which ought not to be hastily decided, how far we should be justified in running even the most remote risk of explosion in establishments such as light-houses, the sudden failure of which might involve consequences of the most fatal description, and the situation of which is often such that their re-establishment must be a work of great expense and time.

Drummond and Voltaic Lights.—The application of the Drummond and Voltaic lights to light-house purposes is, owing to their prodigious intensity, a very desirable consummation; but it is surrounded by so many practical difficulties, that it may, in the present state of our knowledge, be pronounced unattainable. The uncertainty which attends the exhibition of both these lights is of itself a sufficient reason for coming to this conclusion. But other reasons, unhappily, are not wanting. The smallness of the flame renders those lights wholly inapplicable to dioptric instruments, which require a great body of flame, in order to produce a degree of divergence sufficient to render the duration of the flash in revolving lights long enough to answer the purpose of the mariner. M. Fresnel made some experiments on the application of the Drummond light to dioptric instruments, which completely demonstrate their unsuitability for this combination. He found that the light obtained by placing it in the focus of a great annular lens was much more intense than that produced by the great lamp and lens of Corduan; but the divergence did not exceed $30'$; so that, in a revolution like that of Corduan, the flashes would last only $1\frac{1}{2}$ second, and would not, therefore, be seen in such a manner as to suit the practical purposes of a revolving light. The great cylindric refractor, used in fixed lights of the first order, was also tried with the Drummond light in its focus; but it gave colored spectra at the top and bottom, and only a small bar of white light was transmitted from the centre of the instrument. The same deficiency of divergence completely unfits the combination of the Drummond light with the reflector for the purposes of a fixed light, and even if this cause did not operate against its application in revolving lights on the catoptric plan, the supply of the gases, which is attended with almost insurmountable difficulties, would, in any case, render the maintenance of the light precarious and uncertain in the last degree.

There are many questions of much interest regarding light-houses which appear to open an extensive field of inquiry; and it may be doubted whether some of them have received that degree of consideration to which their importance entitles them. Among these we may rank the numerous questions which may be raised regarding the most effective kind of distinctions for lights. Those distinctions may be naturally expected to be of the most effective kind which strike an observer by their appearance alone. Thus a red and

white light, a revolving and a fixed light, offer *appearances* which are calculated to produce upon the observer a stronger sense of their difference than the same observer would receive from lights the sole difference of which lies in their revolutions being performed in greater or less intervals of time. On the other hand, the distinctions derived from time, if the intervals on which they depend do not approach too closely to each other, appear to afford very suitable means for characterizing lights; and the number of distinctions which may be founded upon time alone are pretty numerous. Colored media have the great disadvantage of absorbing light, and the only color which has hitherto been found useful in practice is red, all others at even moderate distances, serving merely to enfeeble, without characterizing lights. In the system of Fresnel, as already explained, all the distinctions are based upon time alone. Mr. Robert Stevenson, the engineer of the Northern Light-houses, has invented two distinctions, which, although they are produced by variations of the time, possess characteristic *appearances*, sufficiently marked to enable an observer to distinguish a light without counting time. The one is called a *flashing* light, in which the flashes and eclipses succeed each other so rapidly as to give the appearance of a succession of brilliant scintillations; and the other has been called *intermittent*, from its consisting of a fixed light, which is suddenly and totally eclipsed, and again as suddenly revealed to view. The effect of this light is entirely different from that of any revolving light, both from the great inequality of the intervals of light and darkness, and also from the contrast which is produced by its sudden disappearance and reappearance, which is completely different from the gradual diminution and increase of the light in revolving lights, more especially in those on the catoptric principle. The great and still increasing number of lights renders the means of distinguishing them one of the most important considerations connected with light-houses.

Lights on the Coast.—Not less important, and very nearly allied to the subject of distinction, is that of the arrangement of lights on a line of coast. The choice of the most suitable places, and the assigning to each the characteristic appearances which are most likely to distinguish it from all the neighboring lights, are points requiring much consideration; and it ought never to be forgotten, that the indiscriminate erection of light-houses soon leads to confusion, and that the needless exhibition of a light, by involving the loss of a distinction, may afterward prove inconvenient in the case of some future light, which time and the growing wants of trade may call for on the same line of coast. To enter at length upon this topic, or even to lay down the general principles which ought to regulate the distribution of lights, would exceed the limits of this article; but in connection with this it may be observed, that the superintendence of light-houses should be committed to one general body, and ought not to be left to local trusts, whose operations are too often conducted on narrow principles, without reference to general interests. The inconveniences arising from interference between the distinctions of the lights under one trust, and those of the lights under another, are thereby avoided; and the full advantage is obtained of the means of distinction at the disposal of both.

The considerations which enter into the choice of the position and character of the lights on a line of coast are either, on the one hand, so simple and self-evident as scarcely to admit of being stated in a general form, without becoming mere truisms; or are, on the other hand, so very numerous, and often so complicated, as scarcely to be susceptible of compression into any general laws. We shall not, therefore, do more than very briefly notice, in the form of distinct propositions, a few of the chief considerations which should guide us in the selection of the sites and characteristic appearance of the light-houses to be placed

on a line of coast. For further information on this subject, see works mentioned at the end of this article.

1. The most prominent points of a line of coast, or those first made on *over-sea* voyages, should first be lighted; and the most powerful lights should be adapted to them, so that they may be discovered by the mariner as long as possible before his reaching land.
2. So far as is consistent with a due attention to distinction, revolving lights of some description, which are necessarily more powerful than fixed lights, should be employed at the outposts on a line of coast.
3. Lights of precisely identical character and appearance should not, if possible, occur within a less distance than 100 miles of each other on the same line of coast, which is made by *over-sea* vessels.
4. In all cases, the distinction of color should never be adopted except from absolute necessity.
5. Fixed lights, and others of less power, may be more readily adopted in narrow seas, because the range of the lights in such situations is generally less than that of open sea-lights.
6. In narrow seas, also, the distance between lights of the same appearance may often be safely reduced within much lower limits than is desirable for the greater sea-lights. Thus there are many instances in which the distance separating lights of the same character need not exceed 50 miles; and peculiar cases occur in which even a much less separation between similar lights may be sufficient.
7. Lights intended to guard vessels from reefs, shoals, or other dangers, should, in every case where it is practicable, be placed *seaward* of the danger itself, as it is desirable that seamen be enabled to make the lights with confidence.
8. Views of economy in the first cost of a light-house should never be permitted to interfere with placing it in the best possible position; and, when funds are deficient, it will generally be found that the wise course is to delay the work until a sum shall have been obtained sufficient for the erection of the light-house on the best site.
9. The elevation of the lantern above the sea should not, if possible, for sea-lights, exceed 200 feet; and about 150 feet is sufficient, under almost any circumstances, to give the range which is required. Lights placed on high headlands are subject to be frequently wrapped in fog, and are often thereby rendered useless at times when lights on a lower level might be perfectly efficient. But this rule must not, and indeed can not, be strictly followed, especially on a coast where there are many projecting cliffs, which, while they subject the lights placed on them to occasional obscuration by fog, would also entirely and permanently hide from view lights placed on the lower land adjoining them. In such cases, all that can be done is carefully to weigh all the circumstances of the locality, and choose that site for the light-house which seems to afford the greatest balance of advantage to navigation. As might be expected, in questions of this kind, the opinions of the most experienced persons are often very conflicting, according to the value which is set on the various elements which enter into the inquiry.
10. The best position for a sea-light ought rarely to be neglected for the sake of the more immediate benefit of some neighboring port, however important or influential; and the interests of navigation, as well as the true welfare of the port itself, will generally be much better served by placing the sea-light *where it ought to be*, and adding, on a smaller scale, such subsidiary lights as the channel leading to the entrance of the port may require.
11. It may be held as a general maxim, that the fewer lights that can be employed in the illumination of a coast the better, not only on the score of economy, but also of real efficiency. Every light needlessly erected may, in certain circumstances, become a source of confusion to the mariner; and, in the event of another light being required in the neighborhood, it becomes a *deduction* from the means of distinguishing it from the lights which existed previous to its establishment. By the

needless erection of a new light-house, therefore, we not only expend public treasure, but waste the means of distinction among the neighboring lights. 12. Distinctions of lights, founded upon the minute estimation of intervals of time between flashes, and especially on the measurement of the duration of light and dark periods, are less satisfactory to the great majority of coasting seamen, and more liable to derangement by atmospheric changes, than those distinctions which are founded on what may more properly be called the characteristic appearance of the lights, in which the times for the recurrence of certain appearances differ so widely from each other as not to require for their detection any very minute observation in a stormy night. Thus, for example, flashing lights of five seconds' interval, and revolving lights of half a minute, one minute, and two minutes, are much more characteristic than those which are distinguished from each other by intervals varying according to a slower series of 5'', 10'', 20'', 40'', etc. 13. Harbor and local lights, which have a circumscribed range, should generally be fixed, instead of revolving; and may often, for the same reason, be safely distinguished by colored media. In many cases, also, where they are to serve as guides into a narrow channel, the leading lights which are used should, at the same time, be so arranged as to serve for a distinction from any neighboring lights. 14. Floating lights, which are very expensive, and more or less uncertain, from their liability to drift from their moorings, as well as defective in power, should never be employed to indicate a turning-point in navigation in any situation where the conjunction of lights on the shore can be applied at a reasonable expense.

British and Irish Lights.—English lights are placed under the Corporation of Trinity House of Deptford, Stroud; the Scottish lights are under the management of the Commissioners of Northern Lights; and the Irish lights are under the care of the corporation for preserving and improving the port of Dublin, commonly called the Ballast Board.

The last act of Parliament on the subject of light-houses forms part of one the general title of which is, "An act to amend various laws relating to merchant shipping." It passed 20th August, 1853. The chief provisions which affect light-houses are the following: 1. The light dues of the United Kingdom are to form one *imperial* fund, under the control of the Board of Trade. 2. From this fund all expenses of erecting and maintaining the lights of the United Kingdom are to be defrayed. 3. The three boards which manage the light-houses in England, Scotland, and Ireland, are to render account of their expenditure to the Board of Trade. 4. The Trinity House, or English board, is to exercise a certain control over the boards in Scotland and Ireland, and is to judge of all their proposals to erect new lights, or to change existing ones; but in every case the sanction of the Board of Trade must precede the acts of each of the three boards.—E. B.

Comparison of the Systems of Lighting in the United States, France, Great Britain, etc.—To make this comparison intelligible, will require a brief notice of the light-house systems of France and Great Britain, with some remarks on the systems of other countries, before giving an extended notice of the systems of the United States' light-houses.

France.—The administrative matters relating to light-houses, though hardly such as it would be possible for us to follow, are, nevertheless, regulated with a system of order worthy of all commendation. As with us, no light dues are exacted from shipping, but the light-houses are a direct charge upon the treasury, and supported by annual appropriations. The question, shall there be a light-house at a particular point, is decided by a board consisting of naval officers, government engineers, and scientific civilians. The first decision settles that inquiry is desirable. The

civil engineer of the Department where the work is to be placed, reports his views, with plans and estimates for it, which are laid before the board by their secretary. If it now appears that the work should go on in the manner proposed, the details of construction and the estimates pass to the general council of government engineers (Bridges and Roads—"Ponts et Chaussées"), and when approved are constructed by contract, under the supervision of the government engineers of the Department. These engineers also superintend all repairs of light-houses. In some cases local boards are required, first, to examine and report upon the necessity for a proposed light, before the subject is examined by the light-house board. The administrative details are in the Department of State, ministry of public works, under which the different persons referred to, serve. The general arrangement of sea-coast lights, adopted on the report of Rear Admiral Rossel to the light-house board in 1825, is based upon two principles: that one light of the brightest class shall not be lost sight of until another is visible; and that such distinction shall be presented by the light, that a vessel on nearing the coast, without very gross error in the knowledge of her position, can not mistake one light for another. 21 nautical miles was adopted as the distance of visibility of the brightest lights, and three classes of distinction were admitted, viz.: fixed lights, revolving lights showing a bright light, and an eclipse at intervals of a minute and at half a minute. By placing the fixed light midway between the two revolving ones, of the different kinds, and at a distance of 42 nautical miles from each other, the essential conditions of the system would be fulfilled. In applying this practically, it was, of course, so modified as to conform to the general features of the coast, and to the wants of navigation. Between these brightest sea-coast lights, others of inferior power were arranged as required.

Every light is placed under the inspection of a person called a *conductor*, who visits it at least once a month, by night as well as by day, and is provided with keys of the building and of the watch-room, so that he can enter at all times, without summoning a keeper. The resident engineer of the Department inspects all the lights in his Department at least once a quarter, and the chief engineer of the Department once a year, and the secretary of the Department makes an inspection at least once in three years. The light-house keepers are furnished with books, ruled, and with appropriate headings to the columns, to record the observations required of them. Detailed instructions for light-houses and beacons are distributed, which direct minutely their duty.

Prior to 1822, Argand lamps with reflectors were used in the French light-houses. In that year, Augustin Fresnel put up the first lens light of his invention, in the tower of Cordouan, at the mouth of the Gironde. In 1825 the general adoption of the lens system was determined upon. In 1845 there were on the coast of France, not including the colonies, 151 lens lights and 47 reflector lights; and nearly all of the latter were merely *beacon-lights*.

According to Mr. Reynaud's statement, not one reflector light will be left in 1852, in the class of lights of the first and second order. Experience, then, has led to the substitution of lens lights for the others, except as small harbor beacon-lights, requiring a small arc of the horizon to be illuminated. The mechanical lamp used with the lens light was the joint invention of Arago and Fresnel, combining the idea of Rumford, of a number of concentric wicks, according to the intensity and volume required for the flame, and the idea of Carcel of keeping the wick from burning rapidly, by making the oil overflow about it, by raising it with a pump, moved by clock-work. Several kinds of mechanical lamps have, from time to time, been presented for examination and trial, an-

swering, generally, satisfactorily; those used in some of the recent lights are called the "moderator lamp." The repair of 28 lamps of the first order lights, 4 of the second, and 13 of the third, amounted, in 1850, only to \$183 56.

Mr. Fresnel suggests that if it be apprehended, that, on account of the distance of a light-house from the workshops, there may be difficulties in regard to the repairs of the mechanical lamp, the appointment of a mechanic as light-house keeper, and the supplying him with the necessary tools, will be a very simple remedy. In the refracting light the diverging rays from the lamp are rendered nearly parallel, by passing through a glass lens. Several such lenses, forming the sides of a prism, surround the lamp, the light from which is thus refracted into a number of beams corresponding to the number of the faces of the prism, separated by dark angles. If this prism be made to revolve slowly about a vertical axis, there will be alternations of light and darkness, as the beam from the face of the prism reaches the eye, or it is in the dark angle between the beams. The increase of the light to its greatest brightness, and the decrease again, will be gradual. A prism of eight sides, thus revolving in eight minutes, would show bright flashes at intervals of a minute, and eclipses at the same interval.

The lens is made of a number of pieces of glass, ground to the same curve, and fitted closely together. The building up of a lens in this way, of separate pieces, has been carried to very great perfection, and the separate pieces composing it are of beautiful clearness, polish, and precision of form. A drum of glass, cylindrical in its horizontal sections, and lens-shaped in the vertical direction, placed about a lamp which occupies its centre, will diffuse all around the horizon the rays falling horizontally upon it, bending toward the horizon those coming above or below the horizontal line from the lamp, furnishing a fixed light of equal brilliancy in every direction. A panel of glass, lens-shaped in the horizontal direction, being made to revolve about this, would give a bright flash as the axis of the lens passed any particular point; and several of these thus made to revolve, constitute a fixed light, varied by flashes.

When the whole of the horizon is not to be illuminated, a reflector is substituted for the lens behind the lamp, so as to throw to the front the light which would otherwise be lost. Not to lose the light thrown upward by the lamp, a series of glass prisms is so arranged as to receive the rays at the angle at which they are reflected, to throw them downward to the horizon. Similar prisms below the lamp, serve to prevent the waste of the light which falls below the lens. This application of totally reflecting prisms, is claimed by Mr. Alan Stevenson, of Edinburg. There are four orders of lights, according to the range of visibility, determined by the volume and brilliancy of the flame; the first order corresponding to the greatest range. The number of wicks of the lamps, and the dimensions of the whole apparatus, vary, accordingly, in the different orders. The third and fourth orders are subdivided into two classes, corresponding to the larger and smaller size of the apparatus. The dimensions of the lantern of the several orders, the number of wicks of the lamps, and other details, will be found in the table annexed.

Fixed and revolving white lights are used to give six characteristic combinations: the simple fixed light; the fixed light, varied by bright flashes every four, three, or two minutes; the revolving light, with intervals between the flashes, or between the eclipses, of a minute or half a minute. By introducing a red fixed light, alternate red and white flashes, and a fixed white light with red flashes, these combinations are extended to eight. Two fixed white lights, in separate towers, are used in a few cases for the sake of distinction.

The loss of light by a deep-red glass, is stated by Mr. Stevenson to be as high as 80 per cent. of the whole. A pink French glass absorbed but 57 per cent., but the color of the burner was not very decided. All parts of the illuminating apparatus for light-houses are supplied from a dépôt and workshops under the immediate direction of the secretary of the light-house board. The distance to which a light may be seen, its range of visibility (called sometimes simply its range), depends upon the brightness (intensity) of the light, its elevation above the general surface, and the greater or less transparency of the atmosphere. Some persons, too, can distinguish lights at a much greater distance than others. The range of a light, then, is not a sure test for comparing it with other lights.

The value (useful effect) of a light depends on its brightness and the extent of the horizon which it will illuminate. The brightness can be ascertained by experiment with the photometer, in terms of the light of a standard lamp as a unit; the extent of horizon illuminated, by simple measurement in degrees, minutes, and fractions. Hence the value of a light can be expressed in numbers: so many units of the standard lamp, multiplied by so many degrees on the horizon. If the light is not spread uniformly over the horizon, it is necessary to estimate its brightness at different parts, and the space over which it extends. The value for each portion being thus found, the whole value is easily deduced.

Theory will show how much of a light from a lamp can be thrown by a given lens, or mirror, in a particular direction; but as the degree of perfection of these instruments would vary the result considerably, recourse is to be had to experiment in comparing different kinds of illuminating apparatus. Very careful and often-repeated experiments have been made by M. Léonor Fresnel, late secretary of the light-house board of France, for the purpose of comparing the reflector and lens lights used in France. To appreciate them fully, it is necessary to follow the very minute details entered into, by measuring the brilliancy of the light in the various divisions of the horizon, and finding its total value (useful effect) in estimating the value from different parts of the apparatus, and the allowance to be made for loss of light from the construction of the lantern, etc. Without such a scrutiny, however, the character of their author, as an experimentalist, is a guaranty for the accuracy of the results. They show the following comparison for lens lights of the different orders, and equivalent systems of reflector lights:

4th order, 2d class; economy $2\frac{1}{2}$ to 1 in favor of the lens light.

3d order, 1st class; economy $3\frac{1}{2}$ to 1 in favor of the lens light.

2d order, fixed; economy $3\frac{1}{2}$ to 1 in favor of the lens light.

2d order, revolving; economy 4 to 1 in favor of the lens light.

1st order, fixed, economy 4 to 1 in favor of the lens light.

The combination of reflectors, to be equivalent to the first order lens, is such as has never been made. The average economy of the light itself is about $3\frac{1}{2}$ to 1 in favor of the lens system.

To render these deductions strictly applicable to practice, they should be made under the precise circumstances in which the apparatus is used; but as they would then be made in conditions unfavorable to accuracy, it is usual to assume that, in practice, the lamp is burning in the best way, and thus to make the comparisons. To render them strictly applicable to the lights of the United States, the oil, too, should be the same, and the manner of burning it the same; or, if different oils were used, each oil should be burned under the most favorable circumstances for it. These remarks, however, touch only the refine-

ments of the case, and show the desirableness of experiments made with the actual reflectors, lamps, and oil in use in the United States, with the lenses and their lamps, the oil being the same.

The question of the relative economy of the lens and reflector lights, depends upon the relative cost of the light-house adapted to them; of the illuminating apparatus; of the repairs of the building and apparatus; salaries of the keepers; cost of the oil, and incidental expenses. In France two keepers have always been employed for the larger lights; one or the other being required to be constantly on duty, so as never to leave the lights without attendance in the lantern or watch-room. With the new apparatus for the first order lights, in ordinary cases, three keepers are allowed, increasing the expense for salaries about one fourth. With those of the other orders, there has been no increase—two keepers being allowed to those of the second order, and third order, first class, using the mechanical lamp; and one to the third order, second class, and to the fourth order lights, using the ordinary fountain lamps with Argand burners. The light-house buildings are of the same cost, except that an additional room must be provided for the third keeper of the lens lights of the first order. The first cost of the lens apparatus is somewhat greater than that of the mirrors; but the great economy in consumption of oil, turns the scale entirely in favor of the lens lights—giving, according to the calculations of M. Fresnel, made upon the prices in France, for a small light, an economy of nearly 2 to 1 in favor of the lens; and for a large light (revolving light, second order), an economy of more than $1\frac{1}{2}$ to 1. The interest on the first cost of apparatus, and the additional salaries, must make a large increase to counterbalance the large economy in the consumption of oil, which, in France, we have seen to be more than 3 to 1 in favor of the lens lights. The same grade of intelligence and education is stated by M. Fresnel to be required in the keepers of the two kinds of lights. The care of the mechanical lamp, however, requires more mechanical tact than that of a common lamp; while the cleansing of the lens apparatus requires less time and care than the others.

The additional keeper of the large lights, and the providing of a second lamp in case of accident, is supposed to guard against the danger of the total extinguishment, for any considerable time, of the single lights, which is the weak point of the lens system. A very simple alarm is also provided, which, as soon as the overflow in the lamp ceases, rings a bell, giving notice of any derangement in the machinery, etc., for raising the oil. Mr. Stevenson causes this apparatus to keep a bell constantly sounding, and to stop when the machinery becomes deranged; believing that he better secures the watchfulness of the keeper thereby. On this question M. Fresnel gives this very decided opinion—after an experience of 22 years, sustained by the daily results of more than 100 lenticular lights of the first 3 orders—"that they have been distinguished by the regularity of their service." The metallic parts of the lantern are made of gun-metal (bronze), the astragals being inclined to the vertical. The ventilation of the lanterns is carefully attended to. The domes are of copper, painted white inside. There is a lightning-conductor, of copper wire strands, twisted like a rope, to each tower. The keeper's house, and the cellars for oil, are generally detached from the light-house, when practicable. The construction of light-house towers offers nothing for special remark, except that, as might be expected from the care used in obtaining plans for them, they are substantial and convenient, dry and well ventilated.

Oil of colza (rape-seed), expressed from the seeds of a kind of wild cabbage (*brassica oleracea*), is the only oil used in the French light-houses. The colza gives a very white light, and the oil does not readily

thicken by cold. M. Reynaud, secretary to the light-house board of France, speaks of the results of comparative experiments on olive oil, mineral oil from bituminous schiste, hydrogen, and mixtures of oxygen and hydrogen, as having been unfavorable. The oil is tested before being received, by burning for 15 or 16 consecutive hours in a mechanical lamp, when, if it burns clearly, and makes little or no crust on the wick, it is received. The oliometer is also used in the inspection. At the principal ports a book is kept, in which masters of vessels may register their complaints in reference to the lights on the coast. Their remarks are examined, and inquiry made by the inspecting engineers.

TABLE OF COMPARISON OF LENS AND REFLECTOR LIGHTS FOR THE EXPERIMENTS OF M. LEONOR FRESNEL.

Order of the lights.	Class and character of lights.	Equivalent system of reflectors.		Value—useful effects.	Economy—economical effects.
		No.	Diameter.		
			Inches.		
Fourth.....	Second class	2	13 $\frac{1}{2}$	2 —1	2 $\frac{1}{2}$ —1
Third.....	First class...	14	11	1 $\frac{1}{4}$ —1	8 $\frac{1}{2}$ —1
Second.....	Fixed	34	20	1 $\frac{1}{2}$ —1	8 $\frac{1}{2}$ —1
Second.....	Revolving...	24	20	4 —1
First.....	Fixed	36	24	4 —1
					3 $\frac{1}{4}$ —1

For a list of the principal French, Danish, Russian, and other Continental Lights, showing the heights of power and elevation above the level, see the last part of this article.

Great Britain.—The administrative part of the British light-house system is so peculiar, having grown up irregularly with the expansion of commerce, that it does not require to be described in detail. The chief English lights are under the direction of the corporation of Trinity House, Deptford Stroud, London; and the Scottish and Irish lights under commissioners. The expense of the lights is paid by dues collected from vessels of all nations, including England herself.

The British lights are divided, according to their power and position, into three classes—sea-coast, secondary, and harbor lights.

Each district in England has a local inspector, and the members of the Trinity House corporation also inspect from time to time. In Scotland, the engineer of the commissioners has the general superintendence of the lights. Notices in regard to lights are given in several of the daily metropolitan papers, in periodicals perused by nautical men, and are posted at the custom-houses.

The lights of Great Britain are principally still reflecting lights, but the lens light has been introduced in many of the most important positions, and is gradually taking the place of the other.

Trinity House lenses, 1st order, 15; 2d order, 5; 4th order, number not known.

In Scotland, the proportion of lenses to reflectors is greater than under the Trinity House corporation. Mr. Stevenson says: "The Board of Northern Light-houses are, excepting in a few cases, giving up the use of reflectors, and substituting either Fresnel or holophotal lights." (See letter of October 15, 1851.) Quite recently three new lens lights have been established in England, by the Trinity House board; three others, of the first, second, and fourth orders, respectively, have taken the place of reflector lights, and fourth order lenses have been introduced for harbor lights.

The first lens light in Great Britain was established in 1835, at Inchkeith, near Edinburgh, under the charge of Mr. Alan Stevenson; the next at the Isle of May; and now the Scottish lights of the larger classes are gradually being converted into lens lights. The Trinity House, of Deptford Stroud, introduced the first lens light in England, in 1837, at Start Point, in Devonshire. Mr. Herbert says: "The hydraulic lamp is universally in use in the dioptric lights of the corpo-

ration of Trinity House, with one exception (the South Foreland light), where the light is shown from a Carcel lamp, the disadvantage arising from the use of which is the occasional derangement of the machinery." In Scotland, the mechanical lamp is used with the lens lights. When the ventilation of the towers is not complete, the introduction of Professor Faraday's ventilating tubes over the chimneys of the lamps has been found very useful. The consumption of oil is increased, but the light is also increased, and no flickering of the lamp can occur in the highest wind. These tubes are used in all the English light-houses under the Trinity House board. The oil of colza is now exclusively used in all the lights under the Trinity House board. According to Mr. Stevenson, its light is a little more intense than that of spermaceti oil; the consumption for a given quantity of light about the same, whether the two be compared in a mechanical lamp or a common Argand lamp; it remains fluid at temperatures which would thicken spermaceti oil; the flame appears more steady, and hence the breakage of lamp-glasses is less than with spermaceti oil. It is furnished in England at 89 cents per gallon, which is 40 per cent. less than the cost of spermaceti oil there. The supplies of oil, wicks, glasses, etc., are delivered once a year by a vessel belonging to the corporation. There are two distinctive characters given to the reflector lights on the Scotch coast, differing from those already adverted to; in one, by placing the rims of all the mirrors on one side of a revolving light, in one vertical plane, and inclining their axes slightly to the horizon, and causing a rapid rotation of the frame, a flash is produced every 5 seconds, which appears to rise and fall; the bright and dark intervals follow each other rapidly. In the other, an intermittent light is produced by the vertical motion of circular discs in front of the reflectors, eclipsing the light for half a minute, and then permitting it suddenly to show out.

In England, the cost of the lens apparatus for a sea-coast light, lantern, and pedestal, exceeds that of the reflector apparatus nearly one fourth; but this disappears in the cost of towers and apparatus, and the advantage is on the other side when the charge for construction is turned into an annual interest, and the cost of illumination is considered.

No difference is made in the number or salaries of the keepers of the lens lights in England. Two keepers are allowed to all large lights, because one is required always to be on duty in the watch-room.

Comparing the value (useful effect) of the revolving lens light at Skerryvore, Scotland, with the old reflector light at Inchkeith, Mr. Stevenson makes it in the ratio of nearly $8\frac{1}{2}$ to 1, and the economy (economical effect) in the proportion of $3\frac{1}{2}$ to 1. Spermaceti oil was used in these comparisons, the result of which, as to economy, is the same as was obtained in France. In the comparison of fixed lights, Mr. Stevenson makes the economy of the lens light rise to four times that of the reflector. Taking the interest on first cost of erection as an annual charge, and combining it with the cost of maintaining the two kinds of lights, Mr. Stevenson makes the economy of the lens system, for revolving lights of the first order, to be as 1.2 to 1, and for large fixed lights as $1\frac{1}{2}$ to 1.

Argand burners and parabolic reflectors are used in the British light-vessels, both for fixed and revolving lights. The lanterns are of copper, or of gun-metal.

There are from 3 to 11 light-vessels in each of the districts under the charge of the Trinity House board, and in each district a relief light vessel is stationed. A gong is used as a fog-alarm, in the Trinity House corporation light-vessels.

The lens system was early introduced into Holland, where it has been entirely approved; it has also been introduced into Sweden, Denmark, Prussia, and Russia. The colza oil is also in common use. There is

no case where the lens lights have been introduced, in which recurrence has been made to the reflector system.

From these data, we are prepared to make the comparison required by the instructions of the Department, under the heads which it has pointed out, as far as it can be done without further experiments.

The use of these data will be entirely safe, since the systems of reflecting and refracting are compared under the most favorable circumstances for each class.

1. *Useful Effect*.—We have just shown that, by the experiments of Fresnel and Stevenson, the useful effect of a lens light is to that of a reflector light of the same class, on the average, as $3\frac{1}{2}$ to 1; of course, the holo-photal system of saving some of the lost light in the various arrangements, increases this disparity.

2. *Economy—First Cost—Repairs—Durability—Efficiency*.—This branch of the subject has been so elaborated elsewhere in this report, that it is considered only necessary to remark briefly upon it in this place.

Assuming that the lights in the two systems are the best of their kind:

The economy of the third order lens light, in comparison to the reflector light, as nearly equal to it as possible, is as 1 to 2.6. That is, it requires more than two and a half times as much oil, etc., for the reflector light, which is less than one third as useful, as for the lens light.

The economy of the second order lens light, in comparison to the reflector light, as nearly equal to it as it is possible to be made, is as 1 to 4.07. That is, the lens apparatus is four times as advantageous as the reflector light.

The economy of the first order lens light, compared to that of the reflector, is 4.08 to 1; or that the reflector is four times as expensive as the lens, or that the lens is four times as advantageous as the reflector light.

"That if we take into account the first cost of construction and the expense of their maintenance, we will find, in respect to the effect produced, the new system (dioptric) is still from one and a half to twice as advantageous as the old."

The repairs to the mechanical lamps employed in lens lights, amount to a mere nominal sum.

No difficulty can be anticipated in getting proper keepers to attend to the lens lights. Men belonging to the class of ordinary mechanics or laborers, are appointed to take charge of the lamps in France. Eight or ten days will suffice to instruct a light-keeper in the most essential parts of his duty, receiving lessons from an instructor conversant with all the details of the service.

The attendance upon the lamps can no longer be regarded with fear of ill consequences. They have been greatly improved, and are now believed to be nearly perfect.

There is nothing belonging to a mechanical lamp which could not be repaired by a watch-maker, and any person capable of taking charge of a movable light is equally competent to manage a lens light.

While experience has fully proved that the fears which were entertained of the extinction of the single lamp used in the lens lights are illusory, yet, should they still exist in any mind, any greater guaranty be absolutely required than experience gives, it would be easily afforded by furnishing each of the three or four wicks of the mechanical lamp with a separate pump, rendering them thus, in effect, three or four lamps. By subdividing the wicks, this might, if desired, be carried still further, and the expense of the additional pumps would not add two dollars per annum to the cost of each first-class light. The experience in relation to lenses has not been confined to any one country; even in our own, with but three stations, the results are most conclusive in their favor. Every first-class light should have two keepers, as in Great

Britain, etc. Such, however, is not the case in the United States; and in making the comparison of cost, they have deemed it best to allow the salary of an assistant keeper, and the additional cost of his dwelling-rooms, in making comparative estimates of the expense of the lens and reflector lights; but in comparing the actual annual expense of lights per lamp in this and in foreign countries, no credit was given to the foreign light for having additional keepers, and no charge made to our lights for deficiency of keepers. The Congressional Committee on Commerce say:

"It is not believed that dioptric lights of the first order can be required at any points except a few, and those the most important outer sea-stations. The remarks hereinafter made in regard to the comparative efficiency and economy of French and American lights, and the letter of the Auditor, may suggest doubts of the propriety of using any of the first order."

First order lights are, if possible, *more necessary on our coast than on that of any other country, and the Board can not, therefore, conceive what good reason could be given for not introducing them.* It is true, we have no first order lights at present, but many are claimed to be of that class, while they are no better than third-class ones. It is demonstrated elsewhere in this report, that the first order lenses are absolutely necessary; and it is beyond question true, that no combination of the reflectors can produce a first order light equal in power to a first order lens.

Again, the committee say:

"In arranging lights, useful effect and expense should be looked at in one view. An outer or sea-coast light should have a 'portee' or reach of light sufficient to give the approaching vessel, in all weathers, timely notice of danger. Any expense in fitting up lights to produce more effect is useless. A light extending its limit of visibility to the distance of 25 miles, is as efficient and useful as one of greater range. The mariner sees it in ample time to shape his course free from all difficulty." The Board concur in these opinions. *But our lights are not of that character.* The object of a light is to warn the navigator of some hidden danger, or of his approach to land, and to guide him clear of that danger on his way, or into his destined port. It therefore becomes necessary to regulate the power and range of a light, solely with reference to these primary objects. If a light is placed on a "clear coast" merely to warn the mariner of his approach or proximity to a lee-shore, or of his danger of running his vessel on it at night, a power and range must be given with reference to the gradual or irregular soundings in approaching the danger. If it is intended to serve as a guide around a dangerous point or shoal, then it becomes necessary to give it such a range as will insure safety to the vessel outside of these dangers under every circumstance; such, for example, as a sudden storm, or a continued gale blowing on shore for many days.

There are many points along the coast of the United States, with dangerous shoals extending many miles from them. To guide vessels clear of these dangers, lights of the greatest power and range are indispensable. Take as example the Nantucket Shoals, those between Barnegat and Cape May, off Absecum, and those off Capes Hatteras, Lookout, Fear, Romain, etc. The shoals off Cape Fear extend 20 nautical miles from the present light, which can only be seen under favorable circumstances about 12 miles. The necessity for first order lights at all points where sea-coast lights are required, is therefore indisputable. None of the lights named above have a sufficient range to warrant the mariner in running boldly for them. The lights on the Bahama banks are vastly superior to those on the Florida coast. The idea that our lights are injured by the haze, mists, etc., etc., arising from the proximity of our southern coast to the Gulf Stream, is therefore erroneous. That there is nothing in the atmosphere

along our coast calculated to affect the brilliancy and power of good lights, which does not exist on the coasts of England, Ireland, Scotland, France, Holland, Denmark, Norway, Sweden, etc., etc., is abundantly proved by the observations of intelligent individuals, who are acute observers of meteorological phenomena, and who have had their attention drawn to this particular subject in consequence of the great inferiority of our lights, compared to those of the rest of the maritime world.

The proper elevation to be given to first-class lights, is a subject closely allied to, and in some degree dependent upon, the general state of the atmosphere in the vicinity of the particular lights.

Observation by intelligent professional persons, will always enable the light-house engineer to act understandingly and decide correctly in all special cases of this kind.

As a general rule, it is considered by able light-house engineers in Europe, that on coasts where fogs prevail, a light should not have a greater elevation than 200 feet above the mean sea-level; but under other circumstances any elevation, if desirable to afford a greater range to the light, may be given, which is not above the region of clouds.

For a list of the principal British lights, showing the height of tower and elevation above sea-level, see the last part of this article.

No light dues are charged upon shipping in France, as in Great Britain, Holland, Denmark, Norway, and Sweden, etc., but the whole establishment is provided for as in the United States and Russia. The maintenance of the light-house buildings is confided to the departmental or local engineers, and the expenses are defrayed from funds appropriated for the service of the department of public works.

United States, Light-house System in the.—The following account of the condition of the light-houses in the United States, and the proposed changes to be made in the light-house system, is extracted from the Report of the Light-house Board, made in 1851.

"The subject of light-house illumination and improvement, although one of occasional discussion in Congress and in certain circles within the last 12 or 15 years, has not occupied the public mind to any great extent in this country, while in Europe generally, and more especially in France, England, Scotland, and Ireland, the ablest and most distinguished statesmen, philosophers, and philanthropists have devoted themselves for the last 25 or 30 years to this subject, in endeavoring to apply practically the aids which science and the mechanic arts have developed. Experiments to ascertain the truthful practical tests of the relative useful and economical values of illuminating apparatus, combustibles, and their accessories, in the most minute detail, have been made by Fresnel, Faraday, Stevenson, and other distinguished individuals; the results of their investigations have been published to the world, and their conclusions have served for the formation of a system for light-house illumination, approximating to perfection. Legislation, too, has taken a prominent part in this important branch of the public service in Europe. In 1825 the French government adopted definitely the Fresnel system of illumination on the coasts of France, and took, as the basis of their future light-house establishment, the programme proposed by the Board organized for the purpose, at the head of which was Admiral Rossel of the French navy.

"About this time the subject, which Sir David Brewster had foreshadowed in 1811, was revived in England and Scotland, through Colonel Colby of the Royal Engineers, and Mr. Stevenson the engineer to the Northern Lights, and the distinguished architect of the Bell-Rock tower. However, no important step was taken on the English side of the Channel to introduce the Fresnel apparatus until after a more careful and rigid

examination had been made by the light-house engineer of Scotland, and after trials of comparative usefulness and economy with that and the reflector apparatus at the Inchkeith station. In 1834, a new impulse was given to the subject of improvement in light-house illumination by letters from Sir David Brewster, and from the action of the House of Commons' select committee. The light-house boards of Europe seemed to exert themselves to satisfy public opinion by the introduction of the Fresnel lens at a few of the most important points for land lights, and of improved apparatus for floating lights, consisting of the Argand lamps and parabolic reflectors, in general use for land lights prior to the introduction of the Fresnel lens, and movable machinery for converting such fixed floating lights as were necessary into revolving ones.

"Although the lens met with much favor in England, and has been gradually getting into use, until nearly one half the sea-coast lights have been changed since 1837, still Scotland has introduced a larger number, in proportion to extent of coast, than the Trinity House corporation. Notwithstanding these decided improvements in the lights of Great Britain, another select committee on light-houses was raised by the House of Commons in 1845; and of the benefits arising from this last report have been the introduction of a large number of lens apparatus, not only in Great Britain but also into many of the colonies, and the substitution of the colza or rape-seed oil in nearly every light-house in the kingdom, in consequence of its superiority and economy compared to the best sperm oil. Improvements in illuminating apparatus and construction, ventilation, combustibles, etc., have made rapid progress in light-house engineering in Europe; while in this country no attempt has been made to improve the lights, with the exception of the act of Congress approved July 7, 1838, and which was the result of the recommendation of the committee on commerce in the Senate, as follows:

"Sec. 2. *And be it further enacted*, That the Secretary of the Treasury be, and he is hereby directed to cause two sets of dioptric or lenticular apparatus—one of the first, the other of the second class—and also one set, if he deem it expedient, of the reflector apparatus, all of the most improved kinds, to be imported, and cause the said several sets to be set up, and their merits as compared with the apparatus in use, to be tested by full and satisfactory experiments.' Under this authority, a lens apparatus was placed in each of the towers at the highlands of Navesink, and 14 out of the 15 reflectors were placed in the Boston light-house. If 'the said several sets' were 'set up' and 'their merits, as compared with the apparatus in use, tested by full and satisfactory experiment,' in conformity to the act, the results of those experiments have not been made known. With this exception, and the authority of Congress 'to test Mr. Isherwood's plan of discriminating one light from another, and of determining the distance of a vessel from a light,' which resulted in placing a second order lens in the tower at Sankaty Head, Nantucket, and the lights authorized by law to be constructed under the direction of the Topographical Bureau (Brandywine Shoal, Carysford Reef, and Sand Key), no steps have been taken to keep pace in light-house improvements in this country with those of France and Great Britain.

"The board, after examining with a patience and a zeal which they believe this important branch of the public service to demand, the different points to which their attention was specially called by the instructions of the Department, have arrived at the following conclusions, which they feel assured will be found to be fully sustained by the detailed data in this report, and its appendix, upon which they are chiefly based:

"That the light-houses, light-vessels, beacons, and buoys, and their accessories in the United States, are

not as efficient as the interests of commerce, navigation, and humanity demand; and that they do not compare favorably with similar aids to navigation in Europe in general, but especially with those of France and Great Britain, and their dependencies. That the light-house establishment of the United States does not compare favorably in economy with those of Great Britain and France. * * * That while the superiority of European lights to those of the United States (arising from the greater care and attention bestowed upon them, the better and more expensive apparatus employed in them, the larger number of keepers to the lights, the more rigid superintendence and frequent visitations for inspection and for delivery of supplies), render any just comparison of them in annual expense in money impossible, it is shown that the difference for maintenance per lamp per annum is very small, fitted with lens apparatus of equal power to the re- and that not invariably in favor of those of this country. * * * If all our present lights were reflectors now in use, the annual expense for supplies of oil and cleaning materials would cost little more than one fourth as much as is now expended for these articles of supply annually; that is, that the supplies now costing upward of \$152,000, would not exceed \$38,000 to \$42,000, making an annual saving of \$110,000 to \$115,000. That in addition to the great superiority in brilliancy, power, and economy of the lenses, compared to the reflectors, they possess the great advantage of durability to the extent of never requiring to be renewed.

"The light-house system of the United States has grown up from small beginnings—only 8 lights in 1789, and 55 lights in 1820—to the enlarged condition of 331 lights in 1851, and without those helps from organization of which some other countries have had the advantage. Great credit is due to the zeal and faithfulness of the present general superintendent, and to the spirit of economy which he has shown. The systems of lighting, however, which 25 years ago were in general use, have gradually given way to more improved ones—more efficient and more economical. The general condition of our lights is not such as our commerce now requires, and not such as the improvements of the day can supply. In considering the condition of the different parts of the system in their order, these facts will strongly appear, viz.: that waste of light, by imperfect apparatus, is waste of oil, and must be paid for in money. The navigator would be more benefited by a few good and reliable lights than by many imperfect ones; indeed, he would prefer no light at all to a bad one.

"Classification of Lights.—A proper classification of lights has many and obvious advantages; in fact, it forms the basis of the arrangement of lights in a system. In England the shore-lights are classed as sea-coast, secondary, river, and harbor-lights. In France they are divided into six orders, according to the size of the illuminating apparatus. The name of the order of the light in the French system suggests its purpose, the range, the relative brilliancy, the size and character of the parts of the illuminating apparatus, and the particulars of detail. That our own lights have not been classed, will explain the many anomalies in the number of lamps, the forms of the reflectors, and the like. It is an admitted principle, that the degree of divergency given to a light by a reflector for light-house purposes, should depend upon its intended objects, including range, etc., etc.; and yet no such principle has been applied in our light-houses, and a waste of light has been the consequence. Classification is of little avail without other and more important qualities; but it is nevertheless an essential of a system. The following is an assumed classification of the lights of the United States, according to their present value and useful effect, as compared to the lens:

1. One station with a first order fixed and a second

order revolving lens light. This combination renders the light only equal to a second order lens light. 2. One station with a second order flashing light (lens). This light is not fully equal to a second order lens, constructed on the most approved plan, in consequence of the loss of light by metal placed in the focal plane. 3. One station with a third order larger model lens light, constructed on the most approved plan. 4. One station with a revolving light, 21 21-inch reflectors, the nearest approximation to a first order catoptric light on the coast; inferior to a second order lens light. 5. Three stations with 18 21-inch reflectors (fixed light); not better than second order catoptric, or third order dioptric light. 6. One station with 30 18-inch reflectors (two lights in one tower), not better than second order catoptric, or third order lens light (larger model). 7. Four stations with 18 15-inch reflectors; about equal to third order lens light (larger model). 8. Two stations with 17 21-inch reflectors; about equal to third order lens light (larger model). 9. Nine stations, 15 21-inch reflectors; not equal to a third order lens light. 10. Eight stations, 14 21-inch reflectors; inferior to third order lens light. 11. Fourteen stations, 15 15-inch do. 12. Three stations, 16 15-inch do. 13. Eight stations, 14 16-inch do. 14. Eleven stations, 13 14-inch do. 15. Three stations, 12 21-inch do. 16. One station, 12 16-inch do. 17. Four stations, 12 15-inch do. 18. Three stations, 11 21-inch do. 19. Twelve stations, 11 16-inch do. 20. Nine stations, 10 21-inch do. 21. Eighteen stations, 10 15-inch do. 22. Forty stations, 10 14-inch do. 23. Thirty-nine stations, 8 14-inch do. 24. Twenty-eight stations, 8 14-inch do. 25. Two stations, 8 16-inch do. 26. Two stations, 9 21-inch do. 27. Eighteen stations, 7 14-inch do. 28. Fourteen stations, 6 14-inch do. 29. Two stations, 2 16-inch do. 30. Eight stations, 4 14 and 16-inch do. 31. Fourteen stations, 11 14-inch do. 32. Four stations, 1 14-inch do. 33. One station, 8 9-inch do. 34. Eight stations, 5 14-inch do. 35. Four stations, 3 14-inch do. 36. Nine stations, without reflectors.

"Recapitulation.—1 tower with 30 lamps (two lights in one tower); 1 do. 29 do.; 1 do. 21 do.; 7 do. 18 do.; 2 do. 17 do.; 8 do. 16 do.; 23 do. 15 do.; 16 do. 14 do.; 11 do. 13 do.; 8 do. 12 do.; 29 do. 11 do.; 67 do. 10 do.; 2 do. 9 do.; 70 do. 8 do.; 18 do. 7 do.; 14 do. 6 do.; 13 do. 5 do.; 8 do. 4 do.; 5 do. 3 do.; 2 do. 2 do.; 7 do. 1 do.; 5 do. small gas-lights; 4 do. lens lights; 37 towers with 21-inch reflectors; 1 do. 18 do.; 41 do. 16 do.; 51 do. 15 do.; 168 do. 14 do.; 1 do. 9 do.; 9 without reflectors.

"Lens Lights.—One station equal to second order lens light. One station not equal to second order lens light. One station with third order (larger model) lens light.

"Reflector Lights.—12 lights not equal to second order lens light. 61 lights not equal to third order lens light (large size). 35 do. (small size). 121 lights not better than fourth order lens light. 84 lights inferior to the fifth and sixth order lens light.

"It is apparent from this statement that there is not a first-class light of any description on the whole coast of the United States. The nearest approximations are at the Highlands of Navesink, composed of a first and second order light, and the revolving reflector light at Mobile Point, of 21 reflectors. The three next in order are Sandy Hook, Cape Henlopen, and Cape Henry, each fitted with 18 21-inch reflectors, and in towers of a good elevation. The Boston harbor light, fitted with 14 21-inch English reflectors, probably now stands next on this list, although the apparatus is much worn, and has not had the care and attention it deserved. There are 236 fixed lights, 30 revolving lights, 2 fixed and revolving lights, 18 double lights, 2 triple lights.

"Average number of lamps per light-house, in the United States, is now $9\frac{1}{2}$; in England (general coast), 13; in Scotland (do.), $17\frac{1}{2}$; in Ireland (do.), 20; in Ireland harbor, $7\frac{1}{2}$. The 41 light-vessels of the United

States are fitted without lamps (in the ordinary acceptance of the term), and without reflectors. The lights are consequently seen at very short distances, and do not fully subserve the objects for which they were authorized by Congress. Argand lamps, with large parabolic reflectors, are employed in Great Britain in light-vessels. The Admiralty list of Trinity House lights for 1849, shows that there were at that time seven floating lights fitted with revolving apparatus, belonging to that corporation.

"Distinctive Characters.—The distinctive characters of the lights of the United States, are:—1st, fixed lights; 2d, revolving lights; 3d, double lights, or lights in two towers; 4th, lights in three towers; 5th, colored lights. Distinctions have been employed at 10 stations from two fixed lights, and from one fixed light, and one revolving light; and in three towers with two lights, one above the other. There is but one triple light on the coast of the United States. The beacons for ranges are not, of course, included in these numbers. Double and triple lights are among the most wasteful modes of distinction, and, it may be added, the least effective. Very little attention has been paid to distinguishing lights in the United States. At points along the eastern coast, many fixed lights are seen at the same moment, without the means of knowing any of them. The proportion of revolving to fixed lights on the entire coast, is 1 to 9.2. The proportion of all modes of distinction, including multiple and colored lights, is 1 to 5.2.

"On the coast of Maine there are 34 light-stations; of which number, 3 are revolving, 1 two-towers fixed and revolving, 1 two-towers fixed lights, and the remaining 29 are all fixed lights. In New Hampshire there are 3 light-stations: 1 fixed, 1 revolving red and white, and 1 fixed, with 2 lights in 1 tower. In Massachusetts there are 42 light-stations; of which 5 are revolving, 11 fixed and revolving, 1 lens, flashing, 8 double fixed, 1 triple, and the remaining 26 are fixed white lights. In Rhode Island there are 9 stations; 2 are revolving, and 7 are fixed lights. In Connecticut there are 11 stations; 2 are revolving, and 9 fixed lights. In New York there are 41 light-stations; 4 are revolving, and 37 fixed lights. In New Jersey there are 10 light stations; 1 revolving, 1 fixed and revolving, 1 red, and 7 fixed lights. In Pennsylvania there are 4 light-stations, and all fixed lights. In Delaware there are 8 light-stations, and all the lights are fixed. The one on the breakwater is called a red and white light, by the keeper; but as the light can not be seen through the dark red shield-like shades, the white part only is seen. In Maryland there are 14 light-stations; 1 double fixed, and 13 single fixed lights. In Virginia there are 8 light-stations; 2 are revolving, and 6 are fixed lights. In North Carolina there are 11 light stations: 2 are revolving, 2 double fixed lights, and 7 fixed lights. In South Carolina there are 5 light-stations; 1 revolving, 2 double fixed light-beacons, and 2 fixed lights. In Georgia there are 9 light-stations; 2 revolving, 1 two fixed beacons, and 6 fixed lights. In Florida there are 12 light-stations; 6 revolving, and 6 fixed; one of the latter with red shades. In Alabama there are 3 light-stations; 1 revolving, and 2 fixed lights. In Mississippi there are 4 light-stations, and all fixed lights. In Louisiana there are 14 light-stations; 3 revolving, 1 with two lights in one tower, 1 red light, and the remaining 9 are all fixed lights. Of the remaining 49 lights, only two are revolving.

"The foregoing lights are exclusive of the 42 light-vessels distributed along the coast, forming an important part of the light system, all of which are fixed lights. From the Highlands of Navesink to the fixed light on Dry Tortugas, a distance of upward of 1800 miles by the coast, there are only 3 prominent revolving lights; all the rest being single fixed lights. The revolving lights at Cape Charles, at Ocracoke, Sapelo,

and Amélia island, are not included in this estimate, because they are minor lights, and not seen, except by vessels bound into ports near their location. Body's island is so badly placed, and so low, that it is of very little use to navigators. From Dry Tortugas to Cape Canaveral, a distance of nearly 400 miles, there is not a single revolving or other than fixed lights. From Charleston to Cape Canaveral, a distance of 300 miles, all the prominent lights are fixed, with only two minor revolving lights. From Charleston to Navesink, there is but one revolving light which can be of any use to the mariner bound to New York.

"In England the lights are distinguished by fixed, revolving, flashing, colored (red only being used), with combinations of double fixed, fixed and revolving, etc., etc. The English Trinity House corporation have 7 revolving lights on board of light-vessels, out of 25; and the proportion of revolving to fixed lights is 1 to 4.2. Of 40 sea-coast lights, 19 are fixed white, 10 revolving, 4 revolving and fixed, 3 red fixed, and 1 double fixed light; that is, one half are fixed, and the remaining half are revolving, etc. The Scotch have 11 fixed white; 2 revolving red and white; 4 revolving, showing brightest every minute; 4 revolving, and showing white lights every two minutes; 2 double fixed lights; 2 flashing once in every five seconds; 4 intermittent lights, brightest state once in two minutes; 2 fixed and red; 1 double, revolving at the same instant; making only 11 fixed lights, out of 33, on the entire coast of Scotland. In Ireland there are five distinctions employed: fixed white, fixed red, revolving white, revolving red and white, and intermittent lights. Of 23 sea-coast lights, 11 are fixed white, 7 revolving, 1 fixed red, and 1 fixed and revolving.

"In France there are nine principal combinations of lights, possessing distinctive characteristics, viz.: 1. Flashes which succeed each other every minute. 2. Flashes which succeed each other every half minute. 3. Flashes alternate red and white. 4. Fixed lights, varied by flashes every 4 minutes. 5. Fixed lights, varied by flashes every 3 minutes. 6. Fixed lights, varied by flashes every 2 minutes. 7. Fixed white lights, varied by red flashes more or less frequently. 8. Fixed lights. 9. Double fixed lights. To which might be added fixed and revolving, in two towers, as at Navesink. There are, however, very few double lights in France, and are only employed to give a very decided character to a locality, in contradistinction to those nearest. By adopting the principle of Rear Admiral Rossel, as set forth in the programme reported by him for lighting the coasts of France, in 1822, finally adopted by the French administration in 1825, and which has been steadily adhered to since, of placing first order sea-coast lights within the distance of 42 nautical miles of each other, there can be no great difficulty in obtaining a sufficient number of very marked distinctions for sea-coast lights. The present advanced and progressive state of nautical science is also brought in to the aid of the light-house engineer, as it will now seldom happen that a navigator will be 84 miles out of his reckoning. By commencing at one line of the boundary of a country, on a sea-coast where a first order light is required, with a revolving light; then, at the distance of 42 nautical miles, a fixed light; and at the distance of 42 nautical miles further, a flashing light; then an intermittent bright, then a fixed light; then a revolving—and so on along the entire coast—the mariner will find no difficulty in recognizing any well-kept light that he may see. Should it become necessary to employ time as one of the elements, then there can be no better system than that employed in France. An occasional deviation may be found to be necessary, such as the erection of two towers for fixed, revolving, or fixed and revolving lights. This is one of the branches of light-house service which can only be executed properly by competent persons, who have thor-

oughly investigated and studied the subject, both in general and for special cases. Should the very ingenious plan of distinguishing lights by occultations, as proposed by Mr. Charles Babbage, prove, upon experiment, to be practicable, the whole system of characteristic distinctions will be entirely changed and greatly simplified.

"The floating lights of the United States are all fixed, and fitted with common torch lamps, without Argand burners and reflectors. The light-vessels are too small for exposed positions, and the models are not the best for the purposes for which they are designed. They are not provided with moorings such as they require, and there is not sufficient attention paid to placing them in their proper positions. The lights, in consequence of the inferior lamps *without reflectors*, are of very little use to the navigator. The uncertainty of finding the light-vessels in their proper positions, by navigators who have been several months absent from the country, produces a general distrust, which destroys all reliance on them.

"The floating lights of England and Ireland are built upon the best models; are of sufficient tonnage to be safe at the points for which they were built; are constructed in the most substantial manner—of wood generally, but in some cases of iron; are moored with heavy anchors and chains, and long scopes. Those placed to mark channels, as the North-West light-vessel at Liverpool, are moored with long scopes of cable to a swivel, and hove in, so that in swinging they do not change their positions perceptibly. These floating lights are placed in the most exposed positions in the Irish or St. George's Channel, in the British Channel, North Sea, and in the most exposed positions of the English and Irish coasts. It very seldom happens that they break from their moorings, and are never taken away without previously placing a duplicate in the position. The system of relief to the keepers and crews is an admirable one; one that insures a faithful performance of the duties intrusted to them, to the great advantage of navigators.

"The English floating lights are fitted with Argand lamps and parabolic reflectors—fixed, revolving, and double lights. They are distinguished by day by cages of hoop-iron, balls, cones, flags, etc., etc. The name and number of each light-vessel are painted in large letters and figures conspicuously on the sides and stern. These lights from the superior apparatus employed in them, and the great care and attention of inspections and superintendence, under the most rigid instructions in detail (which are printed in large type, and hung in frames in the apartments), are very little inferior to the same class of reflector lights, with equal elevations, on shore. Many of them can be seen from the deck of a merchant vessel 12 to 14 miles, while those in this country can only be seen from 3 to 7 miles. Refractors have been made by Mr. Letourneau, of Paris, for light-vessels, which can not fail to be productive of much benefit, and which are, no doubt, destined to render floating lights much more useful to the navigator than they have hitherto been, even in England, where the best reflecting apparatus has been employed for many years.

"*Mode of ascertaining Places of Light-Houses.*—No systematic mode of determining where there should be a light-house, or boat, seems to have been followed for any period of years, and hence the lights are so numerous on some parts of the coast as to be inconvenient, and on other parts are so few as not to supply, *even moderately*, the demands of navigation. The principle adopted by the French commissioner of light-houses for placing lights on the coast of France, will be found stated in another part of this report: steadily adhered to, it has prevented the wasteful multiplication of lights, and has provided, gradually, those really necessary for facilitating navigation.

"*Plans for Light-Houses, Light-Vessels, etc.*—No sys-

tematic methods appear to have been resorted to to secure plans for light-houses, light-boats, lighting apparatus and other accessories, in the United States. The preparation of plans for light-houses, lighting apparatus, and other accessories, is the business of an engineer. Occasionally architects have been consulted, and the Treasury Department and Congress have sometimes devolved the preparation of plans, etc., upon the officers of the corps of topographical engineers. The uncalled-for variety and the inconvenience and ill-adaptation of the structures visited by the Board, show how much the intervention of knowledge is required. In discussing the details of these works, this fact will constantly appear. Professional skill is essential to efficiency and economy. Ill-contrived light-houses require numerous additions, and do not then answer their purpose. Badly-constructed ones are expensive in repairs, besides injuring the apparatus and stores contained in them. Badly-contrived lamps waste the oil, and answer imperfectly the purpose of lighting. Mirrors badly made, unskillfully arranged, unscientific in their forms and adjustments, cause a loss of light which is paid for in oil. Imperfect ventilation causes a bad light. Unscientific arrangements of the lantern in regard to glazing, painting, etc., cause a waste of light. The proper arrangement of these matters is the study and occupation of a profession. The neglect of the proper conditions is wasteful. Plans of light-houses of different classes, with modifications adapted to different localities, would promote economy by the frequent repetition of the same pieces, which in stonework, brick-work, iron-casting, carpenter's-work, glazier's-work, and the like, is productive always of a decided economy. The important subject of alarm signals has not received the attention which it deserves. In the English light-houses the gong is used instead of the bell, to give signals in case of fogs, and no attempt appears to have been made in this country to compare the value of the two kinds of alarm signals. The fog-whistle, introduced by Mr. Daboll and recommended by the Board, has been found to be far more efficient than the bell. The Board had ample means of forming correct conclusions as to the relative merits of the two modes of warning the mariner in fogs, and found no difficulty in deciding in favor of the whistle for positions where it can be put up.

"Mr. Alexander Gordon, civil engineer, of London, proposed to the select committee of the House of Commons on light-houses, in 1845, that the gong employed on board of light-vessels should be superseded by the use of a shrill scream or whistle, such as the railway whistle, giving it sound by a bellows, and having the sound directed around the horizon by reflectors, similar to those of Bordier Marcet for reflecting light. The reflection of the sound of the air-whistle of Mr. Daboll is believed to be practicable by the means suggested by Mr. Gordon; at any rate, the importance of the subject warrants the small expenditure which would be required to test it experimentally. The discharge of heavy guns has been recommended, and would be effective if there were sufficient force at the light-houses to load and fire them. They would always be expensive, however, every discharge of a 24-pounder gun costing about \$1. The fog-bells examined by the United States' Board were not placed so as to produce the best effect. That at Boston harbor was inclosed in a frame building, the sides of which effectually deadened the sound in two directions. It is time that this subject received full and careful investigation by experiments under the direction of scientific men. Besides this class of signals, those intended to guide vessels entering into *barred* harbors, when (from heavy weather or other causes) pilots can not be had, should be carefully systematized. The system should be adopted of Captain Fenoux, of the French navy, depending upon the positions of a movable triangle fixed to a pole or mast, or to a light-house; and that of Lieutenant John

Rodgers, United States' navy, by a flag, to be used in a boat or on shore. Surf-boats and life-boats should be furnished to certain light-house stations, and the means of readily providing crews for them in time of need, be furnished. They should be planned by, and constructed under the direction of, competent persons, who would study all the details of their use, and make it certain that when required they could be launched and effectively manned. The trustees of the Liverpool Dock Company (England) have, under the admirable management of their very able marine surveyor of that port, a most perfect system for the relief of the shipwrecked.

"There are nine life-boats stationed at different points around the bay and port of Liverpool. The boats are constructed on the most approved principles; kept on carriages in the boat-houses near the shore, and horses provided to enable them to proceed to the most advantageous spot for launching. A gun is placed at each station to summon the crew, besides distress flags placed at each light-house, light-ship, and telegraph station. The arrangements are so perfect that in many instances the life-boat has been manned, launched, and on her way to the wreck in 17 or 18 minutes from the time the distress signal was made. The life-boats are manned by picked boatmen of Liverpool and picked fishermen along the coast, who reside near the boat stations, and who are familiar with the banks, swashways, tides and currents, in Liverpool Bay. The whole of the boatmen are kept on constant and permanent pay, and are regularly mustered and exercised once a month, and no expense has been spared in rendering the boats, their equipments and crews, as perfect as possible. The Liverpool arrangements are well worthy of imitation for many parts of our dangerous coast (especially during the winter months). The necessity can not too strongly be urged for the employment of more efficient means than now exist at the points where life-boats have been authorized by law to be placed.

"*Light-Boats and their Accessories.*—The first cost, large annual expense for maintenance and repairs, and the rapid decay of light-vessels, render this mode of lighting very objectionable, independently of the ineffectual manner in which they subserve the purposes of warning the mariner of danger. That this description of lights has not received the attention in this country due to its importance as a necessary adjunct to a proper system of sea-coast illumination, is very evident to the Board.

"That there are many points on our extended sea-coast requiring to be lighted, which will not admit of any other means, is also evident. It therefore becomes necessary to select those means least objectionable, in an economical point of view, and best adapted to the desired end. The rapid decay of timbers, especially on our southern coast, would seem to suggest the propriety of employing more durable materials. It is stated by the general superintendent of lights that these vessels last from 5 to 10 years. To obviate the necessity for renewing them at such short periods iron vessels might, with great propriety, be substituted. The experiment has been tried in Europe with perfect success. The advantages of iron over wood for the construction of light-vessels are self-evident. Durability, buoyancy, and economy of first cost, are the advantages, without any conceivable disadvantages that could arise from their introduction.

"The inferiority of those vessels seen by the Board, the large sums appropriated annually for their support and repair, and the small amount of usefulness arising from their employment, warrant the Board in recommending a better class of vessels; to be built of iron, and filled with the best parabolic reflectors and Argand lamps, similar to the north-west light-ship at Liverpool and those generally employed by the Trinity House Board and Irish Board. Proper distinguishing

marks by day, as well as the distinctions of the lights at night, should not be neglected, and the Board can not do better than recommend the Liverpool and other English light-vessels as proper models, in every respect worthy of imitation. There are many points on our southern coast, especially in the sounds and bays, where small light-vessels are now placed, at which screw-pile foundations might be substituted with great advantage to the navigator, and in an economical point of view. Structures on screw-piles costing in the aggregate much less than the light-boats, and affording a more powerful and efficient light, would conduce greatly to the efficiency and economy of this branch of the lighting service of the United States. The apparatus of the light-vessels of this country is so far inferior that most intelligent and disinterested persons engaged in commerce and navigation pronounce them useless. The example of the Trinity House corporation, Liverpool lights establishments, etc., etc., in fitting up their light-ships with 21-inch parabolic reflectors and Argand lamps and burners, has not been followed in this country. While the light-vessels of this country are comparatively useless, those of Great Britain are in many instances equal, and in all nearly so, to those placed in towers on the shore. The introduction of movable machinery, with the view to distinguishing these lights, is not of very recent date in Europe, though not known here.

"The removal of light-vessels from dangerous and important points on the coast, without due notice (a source of almost universal complaint by masters of vessels), is an evil that can not be remedied too soon. It has not been many days since the finest steam-frigate in the navy struck on a dangerous shoal, properly laid down on the coast-survey chart, in consequence of the absence of the light-vessel from her position. Light-vessels seldom break away from their moorings in England, and are never taken away from their positions without previously placing a substitute. This branch of the lighting service of the country is probably the most defective. Properly modeled, built, and moored, light-vessels, fitted with the best apparatus, and placed under the charge of competent masters, with ample crews, governed by the most rigid rules and regulations, and subjected to frequent visitation and inspection, can alone subserve the great interests of navigation, in this branch of the lighting service.

"*Manner and Frequency of Inspection.—Persons by whom made.*—All experience shows that frequent inspections of light-houses are essential to maintaining an efficient system. These inspections, by competent persons (engineers of the corps of Ponts et Chaussées) are carefully provided for in France, by members of the Trinity Board in England, and by the engineers of local establishments, such as that of the Port and Bay of Liverpool, and by the engineers and their assistants of the establishments of Scotland and Ireland. The vigilance which is secured by inspections at irregular intervals is of greater value than even the direct results of an examination. Our system, at present is quite deficient in this respect; a single annual visit from the collectors, who are superintendents of lights, and the visit of the employee who delivers supplies to the light-house, etc. (the latter, in some districts, being the only inspection), is obviously insufficient. (See Senate Doc. No. 428, 1st session, 29th Congress.) The evident state of preparation in the light-houses at which the visits of the Board were expected, showed that good effects would flow from a system of inspection. Such a system could be organized with very little, if any, additional expense to the government; which will be discussed in detail in another part of this report. The efficiency which would be gained by thorough inspection would justify additional expenditure, if it could not be reached without it; but it is believed to be clearly demonstrated elsewhere in this report, that the present annual expenditure for com-

mission on purchases, distributing supplies, and nominal inspections, *would be ample*, under the system proposed by the Board, to produce these desirable and beneficial results. *Better have fewer lights and effective, than many without efficiency.* In the district of New York the collector employs an assistant, who is charged with the care of the lights, beacons, buoys, etc., and who has under his charge a small vessel for furnishing supplies, visiting the lights, replacing buoys when displaced, and the like. The zeal of this gentleman has been servicable in the management of this district; and were it guided by good instructions, and sustained by occasional visits of a competent general inspector, would produce still better results.

"*Positions of Beacons, Buoys, etc.*—As a general rule, only seamen familiar with hydrography, and pilots, know what beacons, buoys, and sea-marks are required, and where and how they should be placed. The beacons, buoys, and sea-marks which would suffice for pilots, with their accurate knowledge of natural and artificial objects available for safe navigation, are not always sufficient for mariners generally. Their object is not to dispense with the services of the pilot, but to furnish him with marks, etc., to provide for cases of emergency, when the vessel must enter, and may not be provided with a pilot. Small coasting vessels, carrying freights which do not pay well, can not afford to pay pilotage. The necessity for the beacons, buoys, and sea-marks recently and at present provided for by law, is inquired into and reported upon by the superintendent of the coast survey, on the examination of officers of the work, and by the chief of the Topographical Bureau. They are then usually placed by pilots or seamen, but sometimes by the officers of the coast survey. When required to be removed on account of ice, or for repairs, or when displaced, they are replaced by contract by the year, under the authority of the local superintendent. The duty of replacing buoys driven from their moorings is neither superintended nor executed in a proper manner. The buoys are usually placed by pilots (who contract to perform the service) by compass bearings, ranges, or by guess; and it has been remarked by the surveyors, that in many cases their places are so much changed in different years as to produce error, and even danger. The coast survey officers place them by the known positions of three suitable objects on shore—a method known as the three-point problem, measuring the angles with a sextant. This is the true mode of placing them; and no person should be permitted to put them down who is not competent to use that instrument. When placed, it is indispensable that their position should be verified by a competent officer, that he should report in relation to them to the local or general superintendent, and that he should inspect their positions from time to time, and always when, by accident or design, they have been moved.

"*Coloring and Numbering Buoys.*—Until the passage of the recent law (1850), in regard to coloring buoys, the local superintendents changed the colors at pleasure, often introducing the utmost confusion. No notice of such change being given to the general superintendent, no changes could be made in the charts of the coast, and the worst consequence might have resulted. Wise legislation has checked this; but it is still true, that the examination of positions, colors, and numbers, should be made by competent inspectors, and reported to the Department. Plain as are the directions of the law in regard to coloring and numbering buoys, there is known one important port in which the provisions of the law have been completely misunderstood, so that a navigator running by the buoys must put his vessel, if of considerable draught, on the bar.

"Sufficient care has not been bestowed upon the buoys generally, under the law of 1850. The paint used for coloring has not been, in any single instance that the Board has seen, of the best quality. To carry

out the design of the act of Congress, the red especially should be of the best quality of red lead, the black of the glossiest, and the white of the purest white. Spanish brown and dirty black are difficult to distinguish from each other. Such may be seen almost everywhere along our entire coast. The spar-buoys, being the most common in this country, are inefficient; difficult to give easily distinguished marks or numbers, and from their peculiar shape, size, and improper mooring, are too often at such an angle with the surface of the water as to render them exceedingly difficult to be seen. Can and nun-buoys are employed, but not to a great extent, and those used are much too small. The boat-buoys, used chiefly on the eastern coast are very inefficient. In some of the rivers, barrel-buoys, equal in capacity to about a sixty-gallon cask, are employed. Iron buoys have been authorized, by special act of Congress, for the Columbia River, rivers in Texas, Hatteras Shoals, etc. The moorings of buoys in the United States are, as a general rule, very defective. The weight of the blocks of granite, or sinkers of iron, and size of chains, are not sufficient. For want of proper inspection, buoys frequently sink at their moorings, and part their chains. Too much care can not be taken to guard against these casualties, especially in important channels: in rivers and on sand-bars, lodgments of this kind may destroy a valuable channel. The important duty of raising and replacing buoys should not be left to the discretion of contractors. The kind of buoys required, their material, etc., should all be provided for by competent persons. In regard to distinguishing them, the Board will elsewhere make further remarks. The numbers, as now placed upon the buoys, are very ineffective. The law in regard to coloring and numbering them, however, is deemed all-sufficient.

Notice to Mariners in regard to Changes.—This is a subject which, in the opinion of the Board, requires more attention than has ever been given to it in this country. It is not sufficient to publish changes in a local newspaper. They should be published, as far in advance of the proposed change as possible, in all the leading commercial newspapers, nautical periodicals, and by placards in large type, with conspicuous headings, and distributed at home and abroad, at the custom-houses, and offices of the different consulates. In making changes, they should take place at the precise time designated, and nothing should prevent the perfect fulfillment of the originally published design. Changes of lights in light-houses, removal or placing of light-vessels, should never take place with less than six months' notice: a year's notice would be better. Should a light-vessel break adrift, although replaced within a few days, a notice of both facts should appear together in the same papers, and on the same placards, as the navigator might otherwise see the notice of the breaking adrift, and not the other, and thereby be deceived. This is one of the most important branches of the lighting service, and one that can never be perfectly systematized without a corps of competent and efficient local inspectors. In this respect the Trinity House, Northern Lights, Irish Board, Liverpool Dock Trustees, etc., are good models. Notices of proposed changes of lights, buoys, beacons, and of new lights, are to be found in every part of the globe, and always placed where the navigator is obliged to go before leaving port—the clearance office, and at the office of the consul of his country. The admirable system followed by these independent boards, in all the minute details of the service, for the benefit of commerce and navigation, can not be too highly commended. Those who have been around the world, and visited nearly every principal port it contains, never saw a notice to mariners relating to an American light, except by chance, in some corner of a newspaper, and that probably a merely local one.

“Changes arising from casualties should be pub-

lished widely in the manner prescribed, and at the same time reported by the local inspector to the Department. No changes should be made except on the authority of the Department, which should authorize at least six months' notice, in all cases of lights. The looseness of the system in this country heretofore in these respects is proved by the fact, that although a circular was issued by the general superintendent of lights, etc., directing the collectors, acting as superintendents of lights to report to the superintendent of the coast survey all changes in regard to lights, beacons, buoys, etc., that they might be placed upon the charts, but one collector ever complied with the direction. Changes which otherwise would be improvements, unless known to the mariner, become snares. No list of beacons, buoys, or sea-marks exists; no description of them can be obtained, except by a general visitation and inspection of them along the whole coast. Having failed to obtain the required information, efforts have been made by the Board to procure this important information from the local superintendents, for the purpose of arranging a descriptive list of them. So far only a few returns have been made, and some of these not full enough to carry out the design. European light-house boards do not confine themselves to giving notice to mariners of proposed changes, etc., in their own lights, etc., but they cause those in foreign languages to be translated, and as widely disseminated as their own. The Trinity House corporation of London causes the notices relating to lights, etc., on the French coasts, as well as on their own, to be published in the commercial papers in this country.

Relative Economy of Reflector and Lens Systems.—Now, although the most decided results in favor of economy are to be expected from the reformation of the minor classes of lights, we do not therefore conclude that we should begin with them, because humanity, and the more general interests of commerce, and the safety of our ships-of-war, have their claims. Our ships-of-war, vessels engaged in foreign commerce, all that arrive on our coast from distant voyages, are more liable to suffer from the inferiority of our sea-coast lights, or higher class lights, than are our coasters from the deficiencies of the inferior classes; and, accordingly, it is along our exterior coast line that we find occurring the greater number and the most disastrous shipwrecks during the stormy seasons.

“The minor lights are usually so multiplied, and the localities inside of the general coast line so well known to the navigators of our bays and rivers, that they can not often be at a loss for a secure harbor somewhere in heavy weather; whereas the sea-coast lights, at times comparatively few, and even deficient in number, and at others complicated by their superabundance, occupy positions full of danger to the navigator. It is, therefore, of the first importance to ships arriving on the coast from distant voyages, that the light which they first make should be clearly visible at the greatest distance from the land, and that it should be so distinct in character as not to be confounded with other lights; and it is not less important that we should not delay giving to such lights all the perfection they are capable of receiving; and having accomplished this purpose with respect to the most prominent and important, we should extend the improvement to the lights of inferior classes and of minor importance, although by so doing we were to save at the outset something less than if we were to begin by reforming the minor lights, because in the mean time our foreign commerce and the navy might be suffering to an amount far surpassing that which might be saved to the revenue.

“Mr. Alan Stevenson says: ‘In comparing the fixed dioptric and the fixed catoptric apparatus, the results may be summed up under the following heads:

“1. It is impossible, by means of any practical

combination of paraboloidal reflectors, to distribute round the horizon a zone of light of exactly equal intensity, while this may be easily effected by dioptric means in the manner already described. In other words, the qualities required in fixed lights can not be so fully obtained by reflectors as by refractors.

"2. The average light produced in every azimuth by burning one gallon of oil in Argand lamps with reflectors, is only about one fourth of that produced by burning the same quantity in the dioptric apparatus, and the annual expenditure is £140 3s. 8d. less for the entire dioptric light than for the catoptric light.

"3. The characteristic appearance of the fixed reflecting light in any one azimuth, would not be changed by the adoption of the dioptric method, although its increased mean power would render it visible at a greater distance in every direction.

"4. From the equal distribution of the rays, the dioptric light would be observed at equal distances on every point of the horizon—an effect which can not be fully attained by any practicable combination of paraboloidal reflectors.

"5. The inconveniences arising from the uncertainty which attends the use of the mechanical lamp, are not, perhaps so much felt in a fixed as in a revolving light, because the greater simplicity of the apparatus admits of easier access to it, in case of accident.

* * * * *

"There can be but little doubt that the more fully the system of Fresnel is understood, the more certainly will it be preferred to the catoptric system of illuminating light-houses, at least in those countries where this important branch of administration is conducted with the care and solicitude which it deserves.

"The expense of fitting up a revolving light with twenty-four reflectors, ranged on three faces, may be estimated at £1298, and the annual maintenance, including the interest of the first cost of the apparatus, may be calculated at £418 8s. 4d. The fitting up of a revolving light with eight lenses, and the diacatoptric accessory apparatus, may be estimated at £1459, and the annual maintenance at £354 10s. 4d. It therefore follows, that to establish, and afterward maintain, a catoptric light of the kind called revolving white, with a frame of three faces, each equal in power to a face of the dioptric light of Cordouan, an annual outlay of £63 18s. more would be required for the reflecting light than for the lens light; while for a light of the kind called revolving red and white, whose frame has four faces, at least 36 reflectors would be required in order to make the light even approach an equality to that of Cordouan; and the catoptric light would, in that case, cost £225 more than the dioptric light."

"Convert these two sums into our currency, and it will be seen that we have a saving in the first case of \$309, and in the second case of \$1089 per annum.

"The effect produced by burning an equal quantity of oil in revolving lights in either system, may be estimated as follows: In a revolving light, like that of Skerryvore, having eight sides, each lighting with its greatest power a horizontal sector of 4° , we have 32° (or units) of the horizon illuminated with the full power of 3200 Argand flames, and consequently an aggregate effect of 102,400 flames produced by burning the oil required for 16 reflectors; while in a catoptric apparatus like that of the old light at Inchkeith, having seven sides of one reflector each, lighting with its greatest power a sector of $4^{\circ} 25'$, we have nearly 81° (or units) of the horizon illuminated with the full power of 400 Argand flames, and consequently an aggregate effect of 12,400 flames as the result of burning the oil required for seven reflectors. Hence the effect of burning the same quantity of oil in revolving lights in either system will be represented respectively by 16.7, 12,400=28,343 for the catoptric, contrasted with 102,400 for the dioptric light; or, in other words, re-

volving lights on the dioptric principle use the oil more economically than those on the catoptric plan, nearly in the ratio of 8.6 to 1.

"Let us, then, take the appropriation for oil for the lights in the United States, deducting the quantity used in the four towers fitted with dioptric apparatus, and divide it by 8.6, the proportion to 1, in favor of the lens apparatus.

"1851-2.—Appropriation for oil (less oil burned in lens lights) \$122,629 55; 1 to 8.6 will give necessary quantity for lens lights of equal power, \$34,063 68: annual saving for oil by this mode of comparison, \$88,565 87. Glass chimneys, wicks, and repairs of lighting apparatus, will be in the proportion of not less than 810 to 8198; that is, 1 to 10. Amount appropriated for these objects, minus the expenses of the same articles, for the four lens lights, \$15,162 30; 1 to 10 will give the necessary expense with lenses, \$1216 23: annual saving by this comparison in these articles, \$13,646 07.

"The oil being the most bulky article of supplies, it may be assumed that the saving in oil will be a fair proportion for the transportation, the more especially as spare lamps, burners, reflectors, and the great wear and tear of the Argand lamps, burners, and reflectors, is not included in the estimate of annual saving.

"Amount appropriated for the transportation and delivery of oil and other annual supplies, 1851-2, \$11,437; 1 to 8.6 will give the necessary expense for this article, \$3176 94: annual saving with lenses, \$8260 06. It may be urged that there would not be so great a saving in transportation by the change; of that, the experiment alone can decide. By the aid of a small steamer, one half of the amount appropriated could be saved in money, while very important additional service would be rendered in the way of inspections, and more frequent visits to the principal sea-coast lights. Taking, then, the savings of this mode of comparison, it will be as follows: for oil in one year, \$88,565 87; for wicks, chimneys, repairs of apparatus, etc., \$13,646 07; for transportation, \$8260 06: total annual saving, \$110,471 70. Making within a fraction the same amount which would be saved annually by the introduction of the lens apparatus by this comparison, that was shown by taking the lights in their regular order of powers, and comparing with orders of as nearly as possible equal powers in the Fresnel system. Nothing therefore can be clearer than the results thus set forth.

"The effect produced by the consumption of a gallon of oil in a fixed light, with 26 reflectors, which is the smallest number that can be properly employed, may be estimated as follows: The mean effect of the light spread over the horizontal sector, substituted by one reflector, as deduced from measurements made at each horizontal degree, by the method of shadows, is equal to 174 unassisted Argand burners. If, then, this quantity be multiplied by 360 degrees, we shall obtain an aggregate effect of 62,640; which, divided by 1,040 (the number of gallons burned during a year in 26 reflectors), would give 60 Argand flames for the effect of the light maintained throughout the year by the combustion of a gallon of oil. On the other hand, the power of a catadioptric light of the first order, like that lately established at Girdleness, may be estimated thus: The mean effect of the light produced by joint effect of both the dioptric and catadioptric parts of a fixed light apparatus, may be valued at 450 Argand flames; which, multiplied by 360 degrees, gives an aggregate of 162,000; and if this quantity be divided by 570 (the number of gallons burned by the great lamp in a year) we shall have about 284 Argand flames for the effect of the light produced by the combustion of a gallon of oil. It would thus appear, that in fixed lights the French apparatus, as lately improved, produces as the average effect of the consumption of the same quantity of oil over the whole horizon,

upward of four times the amount of light that is obtained by the catoptric mode, although in certain directions, opposite the axes of each reflector, the catoptric light is fully 50 per centum more powerful than the dioptric light.

"But the great superiority of the dioptric method rests chiefly upon its perfect fulfilment of an important condition required in a fixed light, by distributing the rays equally in every point of the horizon. Hence, the saving for fixed lights in the same amount of oil, etc., appropriated for as before, will be \$91,971 94; saving on other articles, \$22,226 07: total saving per annum, \$114,198 01.

"It may, and probably will be urged, that a large portion of this annual saving will be absorbed in the wages of additional keepers. In answer to that, it may be stated, that in the comparisons of reflecting and refracting systems in Europe, the same number of keepers is required for both, of equal class or order, and therefore the ascertained saving is a net annual gain.

"In the United States, as a general rule, but one keeper (there being only 14 assistants belonging to an establishment of 801 light-stations, fitted with reflector apparatus) is attached to a light-station. To render the larger, or sea-coast lights efficient and safe, two keepers should be attached to each station having a single tower, and three to those with two towers, whether fitted with reflectors or lenses.

"However, as it may be contended, that inasmuch as our reflector lights in general have only one keeper, and that the change to the lens system would require two to each light of the first or second class or orders, it may not be inappropriate to see how many of the present lights on our coast would be required to be changed, and the increased expense for an additional keeper to each. From the north-eastern boundary to the Rio Grande there are 38 positions which ought to be fitted with the most powerful first order lenses.

"There are points between some of these first order lights, which ought to be fitted with second order lens apparatus, making a total of about 50 lights of the first and second orders. An additional keeper for each, at the rate of \$300 per annum, will be \$15,000.

"If this sum be deducted from the total already shown (which, on the contrary, ought to be added to the present expenditures, to render our lights in that department equal to European lights), there will still be an annual saving of \$95,471 70, or \$99,198 01. If additional evidence were required to prove so plain a proposition, that the reflector system is more expensive than the lens system in the proportion of 3·6 to 1, disregarding the great superiority of the lens system for all the useful purposes of the mariner, it would be found in the action of the Trinity House corporation, of Deptford Stroud, London; Northern Lights commissioners, of Edinburgh; and the Ballast Board, of Dublin, Ireland.

"In 1835 the first lens apparatus was introduced into Scotland.

"In 1837 the first lens was introduced into England, under the Trinity House corporation; and since 1845 the first lens light was lighted in Ireland.

"Now (1851) there are very few lights fitted with reflectors in Scotland; the commissioners having abandoned the use of that apparatus, and substituted for it the Fresnel and holophotal system of Mr. Thomas Stevenson.

The Trinity House (London) has upward of 20 lens lights of the first and second order, besides numerous fourth order harbor lights. Lens lights are also being introduced into Ireland; the precise number, however, now existing there, is not known, as they are not marked in their printed lists, and no information has yet been received from that board.

"It is worthy of remark, that these three light-house boards of Great Britain and Ireland, are close

corporations, deriving their means entirely from light-dues levied upon the shipping of all nations, including that of their own. They derive no pecuniary advantages from the government, and are only under its general control; consequently their acts are independent of Parliamentary legislation.

"If these boards had found the recommendations of the select committee of the House of Commons of 1845, to use less expensive apparatus and combustibles in their lights, with a view to the reduction of light dues, had not been based upon sound principles, they would have had no inducement to follow them; for whether the lights are economically kept or not, good or bad, the same amount of light-money would be collected. It is, therefore, plain that the introduction of the lens apparatus, and the colza oil, into the establishments under the control of these independent corporations, was the result of close examination and trial by those charged with, and most interested in the subject. The introduction after France, first by Holland, and successively by Belgium, Hanover, Prussia, Denmark, Sweden, Norway, Russia, Italy, Spain, Portugal, and Brazil, and the colonies of the respective nations, goes far to counteract any prejudice which may exist in any quarter, of the globe against this inimitable illuminating apparatus for light-houses.

"Notwithstanding the renovations of English, Scotch, and Irish lights, and the erection of new towers, fitted with the lens apparatus, a material reduction has been made of late years in the light-dues levied in Great Britain upon shipping. This may in some degree be attributed to the increased amount of commerce and navigation, and the more frequent and rapid intercourse between nations, by the aid of steam navigation; but, it can not fairly be contended that it is wholly due to that cause.

"These facts are undoubted, and the deductions from them, it is believed, will, upon the closest scrutiny, be found to be correct.

"Mr. Alan Stevenson says, 'It therefore follows, that, by dioptric means, the consumption of oil necessary for between 14 and 16 reflectors, will produce a light as powerful as that which would require the oil of 24 reflectors in the catoptric system of Scotland; and, consequently, that there is an excess of oil equal to that consumed by 10 reflectors; or 400 gallons in the year against the Scotch system. But in order fully to compare the economy of producing two revolving lights of equal power, by those two methods, it will be necessary to take into the calculation the interest of the first outlay in establishing them.'

"It is worthy of remark that the French were followed by the Dutch government in introducing lenses into their light-houses.

"The subject of introducing lenses into the Scotch light-houses was brought before the commissioners of Northern Lights by the Engineer* of that body, at the instance of General Colby, of the Royal Engineers, as early as 1824. The Scotch commissioners directed their engineer to visit France, and report upon the lights of that country. At the close of the year 1834, the board directed lenses to be imported for the purpose of making experiments. These experiments resulted in the recommendation that an important light should be changed from a reflector to a lens apparatus.

"It is believed the powerful and unanswerable arguments contained in the letters of Sir David Brewster, in 1833, to the Bell-Rock committee, in favor of lenses, contributed greatly to the early introduction of them into the lights of Scotland.

"Notwithstanding the numerous experiments from 1825 to 1834, made by the Northern Lights commissioners to test the relative merits of the two systems, it was not until the latter year that decisive steps were taken to decide the question.

* Robert Stevenson.

"In October, 1835, the reflecting apparatus of the revolving light at Inchkeith was removed, and dioptric apparatus substituted.

"So great was the satisfaction which this change produced, that another light was immediately changed to a lens light. The second lens light erected in Scotland was at the Isle of May, in September, 1836.

"The Trinity House, London, fitted the Start Point light with a lens apparatus in 1837.

"The Turkish government employed an English engineer in 1836-7, to make experiments with the Fresnel lenses, Drummond's light, etc., to enable it to decide upon the best illuminating apparatus for the Bosphorus from the Black Sea. The letter upon this subject from William Henry Barlow, Esq., which was read before the Royal Society of London, will be found to contain much valuable information for those interested in the experiments of light-house navigation.—*Vide Philosophical Transactions of the Royal Society of London*, 1837, p. 211.

"*Number of Lenses in the World.*—At the present moment (1851), there are lens lights of the three first orders (first, second, and third orders), 216, and of the smaller classes, 152; making the total number of lenses 368.

"They are found now in England, Scotland, Ireland, France, Belgium, the maritime States of Germany, Denmark, Norway, Sweden, Russia (the Russian government has a French artist established at St. Petersburg, for the manufacture of lenses for their lights), Italy, Spain, Portugal, the Mediterranean, Egypt, Turkey, East and West Indies, Brazil, and, in general, in all the colonial dependencies of the European States. One first, two second, and one third order, are the only lenses at present in the United States.

"The three first named were procured in obedience to special acts of Congress, and the third order was placed on the Brandywine shoal by the Topographical Bureau.

"It is understood that the two light-towers now in the course of erection at Sand Key and Carysfort Reef, under the direction of the Topographical Bureau, are to be fitted with first order lenses.

"Mr. Stevenson pays this merited tribute to the distinguished savan whose system is now almost universally admired and adopted throughout the maritime world: "Fresnel, who is already classed with the greatest of those inventors who extend the boundaries of human knowledge, will thus at the same time receive a place among those benefactors of the species who have consecrated their genius to the common good of mankind; and, wherever maritime intercourse prevails, the solid advantages which his labors have procured will be felt and acknowledged."

"*Illumination.*—On a review of this subject, the adoption is recommended, as early as practicable, of the lens system instead of that of reflectors, as most effective and economical.

"It has been shown that the Fresnel lens is essential for sea or lake-coast lights of the first order; that for those of the second order, or for secondary or beacon lights, including the third, fourth, fifth, and sixth orders, the useful effect of a lens light is from 3.6 to 4 times that of reflector lights of the same class, and that, economically, the reflector lights are 4 times as expensive for oil alone as the lens lights.

"It has been clearly shown, in discussing this matter, that if it were possible to convert in a moment all the present reflector lights of the United States into lens lights as nearly as possible (though, in almost every instance, they would be superior), of equal orders, the annual saving, for oil and other supplies, would be \$112,185 27, taking the appropriations of 1851-52 as the basis of the calculation, with, at the same time, an increase of $\frac{3}{4}$ to 4 times as much light from each lantern as at present.

"If the estimates for 1852-53 be taken as a basis, then the annual saving may be increased \$20,000, which will make the entire saving for one year, with all the advantages to be derived from superior lights, \$132,185.

"Add to this sum \$40,000, the mean of the value of the lamps and reflectors proposed to be taken from the light-houses, to be fitted first with the lens apparatus, and which would be required, under any circumstances of improvement, for the 42 light vessels already existing, and the sum of \$172,185 may be put down as clear profit, with which to purchase lens apparatus for the first year.

"By appropriating this sum, or as much of it as can be economically and judiciously employed in improving the sea-coast lights, there will be an additional gain, at the end of the first year, in the difference in the cost of oil, etc., under the two systems, for all the apparatus procured with this saving. This saving will go on from year to year, on compound interest, at the rate of 30 to 50 per cent., until, in 5 or 6 years, should the appropriations be made as required to carry out gradually the system, we shall have lights equal to those of France and Great Britain in brilliancy, useful effect, and economy, and apparatus that never requires renewing, without, in the aggregate, having spent one cent more than would have been required for the ordinary service under the present system, with inferior lights and enormous sums for annual repairs and renovations.

"These estimates are based upon the assumption that the sperm oil now in use is to be continued. Should it be decided, however, to follow the example of nearly the whole maritime world in introducing the colza or rape-seed oil, a saving of 35 to 40 cents per gallon will be gained, equivalent to \$40,000 to \$45,000 more.

"The price of the first-quality clarified colza oil is, on an average, at the principal markets in France, 72 francs the hectolitre, or for a little more than 26 gallons, which is equal to nearly 55 $\frac{1}{2}$ cents per gallon. Sperm oil, in this country, ranges from \$1.30 to \$1.50 per gallon, and it is doubtful if a fair quality can be furnished at these prices. The supply of the best sperm oil to stand a temperature of 28° Fahrenheit, is not equal to the demand, and no other quality should ever be burnt in a light-house. A few gallons of rape-seed oil have been sent from Havre to the Board, costing about 60 cents per gallon.

"This important agricultural product (rape-seed) only requires to be introduced favorably to the notice of our planters and farmers, to become a boon to the nation of no ordinary value. Adapted to the soils of nearly every portion of this great country, its admirable qualities for domestic illumination would soon bring it into favor, and, by its means, expel from our houses the many dangerous fluids now used for the sake only of economy.

"The experiments made by Fresnel, Faraday, Stevenson, and other distinguished individuals, have proved, beyond all question, that the colza is not only better than the best sperm oil (an article now very difficult to procure), but that it will burn 17 hours without coaling the wicks; that it will remain in a fluid state in a lower temperature than the best sperm oil, and that it is cheaper by nearly one third.

"In this country, the quantity of sperm oil, independently of its high price, has not been sufficient to meet the demands for the various purposes connected with steam machinery, etc., for several years. Lard and other prepared oils have been forced to take the place of it, for these and other purposes for which it is peculiarly adapted.

"The returns from the fishing grounds show that this branch of commerce is becoming more and more uncertain, and less profitable, every year. When those engaged in the whale fisheries find it unprofitable,

they will not pursue it because the government may require a few thousands of gallons annually. We can not go wrong in this matter, in following the example of other countries.

"France introduced the rape-seed oil, from conviction of its superiority. England, Scotland, Ireland, and the northern powers of Europe generally, have followed; first from motives of economy, and continue its use from the conviction that it is not only more economical, but is better for light-house purposes than the best winter-strained sperm oil, the only kind used in most lights. Olive-oil has been introduced into the light-houses of Liverpool, England, at a saving of 40 per cent. over sperm oil.

"In the United States, the oil (two kinds, 'winter and summer,' being used) for our lights, is not of the best quality. It is now nearly 50 per cent. higher in price than it was a few years since; and with the present prospects, it must continue to increase in price so long as the demand is so great for it as at present.

"It has been proposed that the 38 most important sea-coast lights should be fitted, with as little delay as possible, with first order lenses, and that the Argand lamps and reflectors taken from them (or such of them as may, upon examination, be found to be sufficiently good for that purpose) be used for fitting up the 42 light-vessels now existing, which have been pronounced by high authority comparatively useless in their present state. Several years would be required to effect this change, as the new lights authorized by law, amounting to 34, exclusive of those for the coasts of California and Oregon, require illuminating apparatus; and as there are only two establishments from which the lenses could be procured for some time at least, it would not be prudent to demand a larger number at once than could be easily supplied.

"Having fitted the most important sea-coast lights with the best lens apparatus, as well as the newly authorized lights, by changing thereafter such only of the minor lights as now, or hereafter, require new apparatus, would in two or three years place the light-house establishment of this country far in advance of its present state in efficiency and economy.

"To purchase Argand lamps and reflectors for the 42 light-vessels, would be to retrograde in light-house illumination at a first cost of \$40,000 or \$45,000, and an annual waste of \$7560 for oil alone; and of the supplies, to the extent to increase the amount to \$10,000, with apparatus which must be frequently renewed, producing only from one fourth to one sixth the usefulness of the less economical system, which never requires renewing.

"Taking the estimate for 1852-3 for maintaining the lights of this country as a basis, the present system costs annually within a fraction of \$135,000 more than the same lights would under the lens system. But in so important and humane a branch of the public service as this is, upon the efficient and proper management of which depends, in a greater or less degree, the loss of human life and property, in which every individual in the land is to a certain extent interested personally, mere saving of money, which is by no means always true economy, should not be the only guide. The incalculable benefits to the seaman; the merchant, who receives the foreign products to gratify the wants of our citizens; the planter, who ships his cotton, tobacco, grain, breadstuffs, provisions, naval stores, and the thousands of products of our climate, to the best markets, would seem sufficient to show the necessity for this change.

"By those of our citizens along our southern coasts, from the mouth of Delaware Bay to the Rio Grande, who are now and have ever been suffering in consequence of a badly lighted coast, will this additional reason be best understood and appreciated. Their freight lists and heavy insurances speak out truly on this point.

"The \$7,000,000 worth of property sent into Key West, and there adjudicated for salvage, within the six years prior to January, 1850 (lost to our citizens and our government chiefly), speaks trumpet-tongued on this subject. But this is not all. The wreck lists of Nassau and New Providence exceed by far those of Key West.

"Let us light our coasts as France and Great Britain have done theirs, and wreckers will be compelled to turn their attention to other means of livelihood, and the consumers of every class and grade will pay less for their necessities and luxuries, and the planter, farmer, mechanic, will have smaller freight and insurance bills to pay on their exports.

"If we assume the necessity for changing all of the lights on our coast to lens lights, and give to each one of them its proper power and efficiency, we should have about as follows: 36 first order lens lights, costing for apparatus \$244,800; 10 second order lens lights, costing for apparatus \$44,000; 61 third order lens lights, costing for apparatus \$113,460; 206 fourth, fifth, and sixth order lens lights, costing, in the aggregate, about \$92,700; total amount necessary to purchase lens apparatus for all the lights in the United States, \$494,960; deduct value of reflectors and lamps for light-vessels at present existing, and for proposed ones, \$45,000; deduct value of present illuminating apparatus, lamps, reflectors, chandeliers, etc., merely estimating the value of the old silver, copper, and iron, say 2500 lamps and reflectors, and 315 chandeliers, at one fifth their cost, \$50,000; deduct first year's saving on oil and other supplies, \$110,000; total expenditure, \$205,000; leaving at the end of the first year, with lenses, only a balance of \$289,960; saving for four years, \$440,000; making a gain, at the end of the fifth, of \$150,040.

"Thus, at the end of the fifth year the country will have gained \$150,000 in money, including interest, and an annual saving of \$110,000, the interest of which will make it \$117,600, and afford to the mariner lights equal to the best in the world, by which means every consumer and exporter will derive a pecuniary advantage; and those who go to sea, either from pleasure or necessity, will be doubly insured against shipwreck on our inhospitable coast.

"To make the reform in our present light-house system perfect in its illuminating department, it only remains to introduce, in addition to the lenses, the colza or rape-seed oil, which will produce an additional saving, as has already been shown, of about \$10,000 per annum; making the grand total, in five years, of \$200,000. It may be contended that, inasmuch as interest is included in the saving, it is but fair to allow it on the first cost, which will be, at the end of the second year, \$15,397 60; third year, \$8,797 60; fourth year, \$2,197 60; making for interest, \$26,392 80; still leaving a nett gain, at the end of five years, of \$132,647 20, without taking into consideration the saving from the rape-seed oil, if introduced, which would increase it to \$182,647 20 of clear gain at the end of five years, in addition to the annual gain and other advantages already stated.

"But if we continue to employ reflectors, such as we have now in use and are constantly introducing into our lights, we will not only lose the amount annually which has been shown we should gain with lenses, but, in addition to that, these reflectors and lamps will require to be renewed once in 10 to 15 years, at a cost very little short of that of the lenses, which suffer no deterioration from long use, and humanity and commerce will continue to suffer for want of good and efficient lights on our coast.

"Inspection.—Without a rigid system of inspection by competent persons, the light-house system can never be efficient or economical. The whole sea and lake coasts of the United States should be divided into light-house districts, with less regard to geographical

than to local lines. For example, the New York district should embrace all the lights from Watch Hill, including Block Island, Montauk Point, etc., to the Highlands of Navesink, up the bays, including the Raritan, Hackensack, Passaic and North Rivers, to the head of navigation. The Philadelphia or Delaware Bay district should embrace the coast from the Barnegat to near Assateague, and up the Delaware on both sides to the head of navigation. The Baltimore or Chesapeake Bay district should embrace all the coast from Assateague to Cape Henry, Hampton Roads and tributaries, and Chesapeake Bay and tributaries, to the head of navigation. The other districts should be formed upon the same principles. In each of these districts there should be a local inspector, who should be furnished with the necessary means and facilities for regularly inspecting the lights, attending to the wants of the keepers, superintending small repairs, reporting the condition of the establishment, at short intervals of time, to the executive officer or engineer of the Light-House Board, superintending the placing, replacing and renovating buoys, beacons, etc., etc., under the general and special instruction of the Light-House Board, communicated through their executive officer or engineer.

"For this purpose, there would be required on the lakes two inspectors, and on the Atlantic, Gulf, and north-west coasts, including all the adjacent navigable waters, from 10 to 13 inspectors more, making the whole number required from 13 to 15.

"Each of these light-house districts should be placed under the charge of an active and zealous officer of the army or navy, who should receive all his instructions from, and be responsible to the Light-House Board, through their executive officer or engineer, and to whom all reports should be made.

"The facilities for inspectors superintending such repairs, etc., etc., as may be confided to the local inspector, to be furnished by the light-house vessels, revenue cutters, and such other means as the Treasury Department may from time to time authorize.

"By this mode of inspection, very little if any additional expense will be incurred, while there will be secured an independent examination of every light on the coast, say from four to six times per annum, by a competent person, whose duty it will be to inform himself upon all essential matters connected with this service. In addition to the foregoing means, the revenue boarding boats might and would be appropriately put in requisition, as occasion might require, to assist the inspector in his duties in situations where a strict economy would not authorize the employment of a vessel permanently to perform this service.

"Instead of, as now, contracting with persons to keep the buoys in their places for a certain sum per annum, and who seldom, if ever, perform the service faithfully, the inspector would, under proper instructions, be required to examine the bars, channels, etc., etc., of his district, at regular periods, and always immediately after heavy gales of wind to ascertain what buoys are out of position, and to replace them.

"The inspecting officers would occasionally be accompanied by the secretary or engineer to the Light-House Board, or perhaps by both of them; a thorough system would be provided, which would inevitably be less expensive in the aggregate than that at present existing without specific law. In connection with these inspections, dépôts for stores, spare buoys, moorings, etc., etc., are indispensable in each district. These dépôts might in most places be at some place requiring but little annual expense, where the buoys and their moorings could be repaired, painted, etc., and where a spare light-vessel might be kept ready for use. There should be at least one spare light-vessel for every three placed in exposed open sea-positions. Duplicate buoys and moorings should be ready at all times. The Light-House Board should have authority

to cause buoys to be placed on newly-discovered shoals, wrecks, etc., etc., whenever necessary. By the employment of these inspectors, the country would derive the benefit of their services without expense, and have an assurance, from their position and standing, of a faithful execution of their duties. The Board would refer again to the reports of the committee of the Senate and House, already pointed out in this report, on this important branch of the lighting service. In connection with this recommendation, the Board would advise that light-keepers be examined, as naval engineers, midshipmen, and cadets are, in reference to qualifications for their appointments; that they should not be allowed to take charge of the lights without suitable preparation; nor the more important lights without proportionally higher qualifications; that such meteorological and tidal observations be required of them in addition to the keeping of suitable registers of lighting, consumption of supplies daily, etc., as may tend to test the capacity of the keepers, and to elevate the standard of information and practical skill of them as a class.

"*To Guide Legislation in Extending and Improving Our Present System of Construction, Illumination, Inspection, and Superintendence.*—The seventh section of the act making appropriation for light-houses, light-boats, buoys, etc., approved March 3, 1851, provides, 'That hereafter, in all new light-houses, in all light-houses requiring new lighting apparatus, and in all light-houses as yet unsupplied with illuminating apparatus, the lens or Fresnel system shall be adopted, if, in the opinion of the Secretary of the Treasury, the public interest will be subserved thereby.'

"This is a wise provision. There are very few cases, in the opinion of the Board, where the public interest will not be greatly subserved by the substitution of the Fresnel lens for the reflectors now employed in illuminating our light-houses. In positions where the light is only required to illuminate a small arc of the horizon, it may be of questionable propriety; but in all such cases, the capable light-house engineer should decide upon the merits of the two kinds of apparatus. In no case requiring one half or more of the horizon to be illuminated, is it believed reflectors ought to be employed, in preference to the lens. There may be occasionally circumstances of a paramount character, which may render the employment of reflectors preferable.

"The ninth section of the act approved March 3, 1851, provides, 'That the President be, and he is hereby required to cause to be detailed from the engineer corps of the army, from time to time, such officers as may be necessary to superintend the construction and renovation of light-houses.'

"The Board are of opinion that this act is one calculated to produce the most beneficial results, in increasing the durability of light-house structures, and consequently lessening, to some extent, at least, the present large annual appropriations for renovations and repairs; and they recommend that no new structure be erected, and no old ones be repaired, except under the superintendence of a competent officer of the corps of engineers.

"The Board are of opinion that, pending the action of Congress upon the subject of improving our lights, etc., much may be done toward introducing a more efficient and economical administration of the establishment, by a rigid adherence to the provisions of the seventh and ninth sections of the law of 1851.

"*Locating of Sea and Lake-coast Lights.*—The Board have adopted the same principle which has proved so effective in the organization of the French system of lights; namely, to place a sea-coast light of the first order, in general, every 42 nautical miles, so that, as a rule, one light will not be lost sight of until another is above the horizon. If it should be necessary to adopt only two main systems of distinction for these

lights into fixed and revolving, then a fixed light should be placed between two revolving lights, suitably distinguished by flashes, etc., so that no two lights of the same kind should be nearer than 84 miles from each other. Other distinctions, easily described in the published lists, and easily comprehended by navigators, which would render all fear of mistakes arising from the want of proper distinctions illusory (without the use of colored media), can be employed. If, however, Mr. Babbage's system prove to be practicable, and be adopted, all doubt in regard to distinctions of light will be obviated. The Board have adopted an approximate programme, in this report, for the sea and lake-coast lights, the number of which is necessary to a full system. Of these many now exist, though not with the requisite range of visibility. There are many locations where the wants of commerce will not require such lights for many years, though necessarily included in a general programme.

"At a full meeting of the Light-house Board, holden on the 6th of January, 1852, the following resolutions were offered and unanimously adopted:

"*Resolved*, That it is the opinion of this Board, 1. That the lens or Fresnel system of light-house illumination is the best at present known. 2. That the lens or Fresnel system of light-house illumination is, in economy, brilliancy, power, and usefulness, superior to the best reflector system of illumination in the ratio of about 4 to 1; or, in other words, that the lens system is about four times more advantageous than the best reflector system, and at the same time, at an expense, for oil alone, of only one fourth as much as the reflector system. 3. That the lens system of light-house illumination is as well adapted to the coasts of the United States as to those of the rest of the maritime world. 4. That while there is no well-founded objection to introducing the lens system of illumination into this country, there is every reason for doing so as rapidly as possible. 5. That the floating lights of this country are comparatively useless to the mariner, in consequence of the very inferior apparatus employed in them. 6. That the reflector lights of the United States are greatly inferior, in usefulness, power, and range, to the same description of lights in foreign countries generally, but especially to those of Great Britain."

"The object of these notes is to point out certain improvements in the use of existing light-houses, by which it shall become almost impossible—1st, To mistake any casual light, on shore or at sea, for a light-house; 2d, Ever to mistake one light-house for another. The plan requires, in most instances, no change in the optical means at present used for condensing and directing the illumination of light-houses; it adds slightly to the facility of observing them at great distances, and from its simplicity and generality is equally adapted to the use of all countries. Revolving-lights must become fixed; but the mechanism already existing for their rotation may, with little alteration, be employed for the motions required by the new system. The principle by which these objects are to be accomplished, is to make each light-house repeat its own number continually during the whole time it is lighted. This is accomplished by inclosing the upper part of the glass cylinder of the Argand burner by a thin tube of tin or brass, which, when made to descend slowly before the flame, and then allowed suddenly to start back, will cause an occultation and re-appearance of the light.

"Congress having authorized lights to be erected on a few of the most prominent and important points to aid the rapidly increasing commerce along that coast, which it is presumed will be fitted with appropriate lens apparatus, in conformity to the 7th section of the act of 1851, the Board have only added the names of the remaining most prominent points of that coast to this list, leaving the more detailed wants of

this branch of the public service to be developed by the operations of the coast-survey, now in rapid progress for external or sea-coast, and of population and interior communication for local lights.

"*Petit Manan Light-house*.—This is a fixed light, 53 feet above the level of the sea, situated on the south end of Petit Manan Island, Maine, lat. $44^{\circ} 22'$ north, long. $67^{\circ} 52'$ west. This light is fitted with 12 lamps and 15-inch reflectors, to illuminate the whole horizon. If the apparatus belonged to the first class, instead of, as it does, to about the fourth, the greatest distance at which it could be seen, under the most favorable circumstances of weather, would be, from a vessel's deck 15 feet from the sea-level, about 13 miles. If we take into consideration the small size of the reflectors, and the small number of lamps for so large an arc of the horizon, it is fair to presume this light is seldom seen over 10 miles. Distant from this light to the eastward are Seal Islands, 34 miles (two fixed lights), and Gannet Rock (flashing light), 46 miles at the mouth of the Bay of Fundy, belonging to the British government. This light, with a proper elevation, and a lens apparatus, would serve to guide vessels bound to any of the ports on the coast of Maine, from Frenchman's Bay to Passamaquoddy Bay, having the sea-coast lights of Seal Island and Gannet Rock to the eastward, and Mount Desert Rock, distant 27 miles to the southward and westward. [Now become a flashing light (1856).]

"*Mount Desert Rock Light-house*.—This light is on the keeper's dwelling, with an elevation of $56\frac{1}{2}$ feet above the level of the sea; it is fitted with 12 lamps and 21-inch reflectors, to illuminate the whole horizon. Lat. $43^{\circ} 58' 5''$ north, long. $68^{\circ} 08'$ west; it is situated about 20 miles S.S.E. of Mount Desert Island; is 27 miles distant from Petit Manan light and 33 miles from Matinicus light (two fixed lights). This light, with the best illuminating apparatus, could not be seen, under the most favorable circumstances of weather, at a greater distance than 14 miles. The small number of lamps for so great an arc, renders it little better than a fourth order light, while its elevation can only give it the range of a light of that class.

"A much greater elevation is required for this light, with the most powerful lens apparatus that can be constructed. Vessels bound from the eastward into any port from the neighborhood of Mount Desert to Penobscot Bay, would run for it; having made it as a first-class light, it would guide them into the ranges of the different harbor-lights along the coast. From its isolated position at the distance of 14 to 18 miles from the nearest land, it is one of the most important points on the eastern coast for a first-class light.

"*Martinicus Rock Light-house*.—These lights (two fixed), are situated on the rock south of Martinicus Island, at the mouth of Penobscot Bay. They are placed 40 feet apart, N.N.W. and S.S.E. on the keeper's dwelling. Each light has 14 lamps and 21-inch reflectors, at an elevation of $82\frac{1}{2}$ feet above the level of the sea; 33 miles from Mount Desert Rock and 39 miles from Seguin's Island light, lat. $43^{\circ} 46' 30''$ north, long. $68^{\circ} 49'$ west.

"*Seguin Island Light*.—This is a fixed light, 166 feet above the level of the sea, fitted with 15 lamps and 21-inch reflectors. This light is deficient in illuminating apparatus; with 24 lamps and 21-inch parabolic reflectors of the proper shape and finish, it could, under favorable circumstances of weather, be seen 18 to 19 miles. It is 39 miles from Martinicus Rock light, 46 miles from Boone Island light, and 21 miles from Monhegan and Cape Elizabeth lights. Lat. $53^{\circ} 41' 36''$ north, long. $69^{\circ} 44'$ west.

"*Boone Island Light*.—This light is situated on the west part of the small low island bearing its name, off York River, Maine. It is fitted with 12 lamps and 15-inch reflectors (fixed), with an elevation of 70 feet above the level of the sea, in lat. $48^{\circ} 08'$ north, long. $70^{\circ} 29'$ west.

Thatcher's Island Lights.—These two fixed lights are situated about two miles off Cape Ann, fitted with 11 lamps and 21-inch reflectors, each with an elevation of 90 feet; greatest range, 16 miles. Cape Ann forms the northern limit of Massachusetts Bay. Distant from Boone Island light 30 miles, Boston light 24 miles, and from Truro, Cape Cod, 43 miles. Lat. $42^{\circ} 38' 21''$ north, long. $70^{\circ} 34' 48''$ west. This is a very important light-station; and the lights require to be increased in power and range.

Truro, Cape Cod, Light.—This is an important sea-coast light, situated on the highlands outside of Cape Cod. It is 43 miles from Thatcher's Island lights, 45 miles from Sankaty Head light, and 41 miles from Boston light. It is fitted with 15 lamps and 21-inch reflectors (fixed), with an elevation of 180 feet, giving it a range, in good weather, if the apparatus is of the first order, of 20 to 21 miles. A first order lens is required for this tower. Lat. $42^{\circ} 02' 23''$ north, long. $70^{\circ} 03' 55''$ west.

Sankaty Head Light.—This is a second order Fresnel flashing lens light. It is placed on the south-east extremity of the island of Nantucket, with an elevation of about 150 feet above the level of the sea, which gives it a range of about 19 miles in ordinary states of the weather. It has been seen at a much greater distance, and is considered equal to the Highlands of Navesink lights (first and second order lenses).

In consideration of the dangerous navigation around the reefs and shoals off the island of Nantucket, it would have been advisable to have placed a first order lens in this tower; but the superiority of this light to those in its vicinity, renders it of doubtful propriety to propose any change in it.

Gay Head Light.—This light is placed on the west point of Martha's Vineyard. It is a revolving light fitted with 10 lamps and 14-inch reflectors, having an elevation of 172 feet above the level of the sea. This light is deficient in power, and not arranged to subserve the wants of the navigator. At the distance of about 12 miles it is obscured about three-fourths of the time. Its present elevation, with first order apparatus, would give it a range of 19 to 20 miles. Lat. $41^{\circ} 20' 54''$ north, long. $70^{\circ} 50' 26''$ west. Distant from Sankaty Head 39 miles, Montauk Point 38 miles, and Point Judith light 30 miles. This light is not second to any on the eastern coast, and should be fitted, without delay, with a first order illuminating apparatus. A glance at the chart will suffice, to see its great importance.

Montauk Point Light-house.—Lat. $41^{\circ} 04' 10''$ north, long. $71^{\circ} 51' 59''$ west. This is a very important light, especially for navigators bound from Europe to New York. It is fitted now with only 15 lamps and 21-inch reflectors for a fixed light. Its reported elevation is 160 feet above the level of the sea, and with a first order apparatus would be seen under ordinary circumstances about 20 nautical miles. Distant from Gay Head 47 miles; from Fire Island Inlet light 66 miles. By erecting a light in the vicinity of Great West Bay, Long Island, midway between Montauk Point and Fire Island lights, the trade between New York and all ports to the eastward, including the whole of Europe, would be greatly benefited.

Lights near Great West Bay, Long Island, New York.—It is proposed to erect a first-class light on Long Island, midway between Montauk Point and Fire Island Inlet, distant 33 miles, to facilitate navigators going to and coming from the eastward. The letters of packet and other shipmasters in Appendix B, will show conclusively the necessity for a light in this vicinity.

Fire Island Inlet Light-house, Long Island, New York.—This is a most important light to navigators trading to New York. It may be said to mark the eastern entrance to the Bay of New York. It is situated on the south side of Long Island, New York, east

side of Fire Island Inlet, lat. $40^{\circ} 37' 46''$ N., and $73^{\circ} 18' 38''$ W. long.; distant 37 miles from the Highlands of Navesink, which mark the western entrance to the Bay of New York. This tower has an elevation of only 89 feet 3 inches, and has only 14 lamps, and 21-inch reflectors for a revolving light. The range of this light, with its present elevation and the best apparatus that could be procured, would not exceed $14\frac{1}{2}$ nautical miles in ordinary weather. It is, therefore, clearly necessary to increase its height, and place in the tower the most powerful lens apparatus that can be procured.

Highlands of Navesink Lights, New Jersey.—There are two towers and lights at this station; a first order fixed, and a second order revolving lens apparatus. The great importance of the lights on this point renders it highly necessary, in carrying out the proposed plan of improving and increasing the number of sea-coast lights, that the second order apparatus should be changed for a first order one. These lights are now the best on the coast, but are not, when combined, equal to better than a second order lens light. With the present elevations of these lights above the level of the sea, and the substitution of a first order lens for the second order apparatus, navigators would be warranted in running boldly for them, and with the certainty of seeing them, under ordinary circumstances, at the distance of 22 nautical miles.

Barnegat Light-house.—This is a light in point of importance equal to that of Fire Island Inlet. It is situated 37 miles from the Highland lights, on Long Beach New Jersey, on the south side of Barnegat Inlet. At present it is fitted as a fixed light, with 11 lamps and 14-inch reflectors, equal in power to about a fifth order lens light. The numerous wrecks, involving the great loss of life and property, attest the truth of the necessity for making this a first class sea-coast light. The tower is 40 feet high, placed on a low beach, giving it a range of probably $11\frac{1}{2}$ nautical miles. The improvement of the Montauk, Fire Island, and Barnegat lights, and the erection of a first class light near Great West Bay, Long Island, would render the approaches to New York Bay much safer than they are at present, and would save to our government and to our citizens many millions of dollars' worth of property, and prevent the untimely loss of many valuable lives.

Absecum Beach, New Jersey.—A sea-coast light is absolutely necessary in this vicinity to guide vessels, bound north, clear of the Absecum and Brigantine shoals. The coast here is very low, and difficult to distinguish, and the light on Tucker's Beach, near Little Egg Harbor, although fitted with 15 lamps and 15-inch reflectors, showing a fixed red light, from its little elevation ($39\frac{1}{2}$ feet) is not seen further than five to eight miles; in addition to which the woods on the Absecum beach to the southward hide it from the mariner going north. A light should be placed somewhere in this vicinity, west of the inlet, and as nearly midway between Barnegat and Cape May light as possible. An examination of this coast by competent professional persons can alone decide the best site for a sea-coast light.

Cape May Light-house, New Jersey.—The position of this light on the east side of Delaware Bay, and its contiguity to the dangerous bank known to navigators as the Five-fathom Bank, renders it of great importance that it should be of the first order. This is a revolving light, 88 feet above the level of the sea, fitted with 15 lamps and 16-inch reflectors. This light has been shown to be inferior to the third order lens light on Brandywine Shoal, in the proportion of three to one. Its present range, under the most favorable circumstances of weather, is not greater than $14\frac{1}{2}$ nautical miles, and, with the present apparatus, it is doubtful if it can be seen so far by several miles. Make Cape May and Henlopen lights first order lights, with

proper elevations, and navigators will be able to place their vessels in positions for receiving pilots without the risk of shipwreck on the dangerous Five-fathom Bank, distant 16 miles from Cape May, and 20 miles from Cape Henlopen. With bearings from these two lights, seen at the distance of 20 to 25 miles, the navigator could always shape his course by the most direct line into the bay, or for the breakwater. The light vessel authorized by law to be placed on the Five-fathom Bank is so often out of position that it is the more important that these improvements should be made.

"Cape Henlopen Light-house.—This is one of the best reflector fixed lights on the coast, although inferior to the third order lens on Brandywine Shoal in the proportion of one to six. This light has an elevation of 180 feet, and only requires a first order lens apparatus to make it equal to the requirements of commerce and navigation. The large amount of trade from Philadelphia warrants the proposed expenditure, and humanity would seem to dictate it as consistent with true policy and philanthropy.

"Assateague Light-house, Virginia.—This light is situated on Assateague Island, between Capes Henlopen and Charles, in lat. $37^{\circ} 54' 36''$ N., and long. $75^{\circ} 21' 45''$ W.; a fixed light, fitted with only 11 lamps and 14-inch reflectors. The shoals of this low and dangerous coast render the improvement of this light one of paramount importance. By elevating this tower to 150 feet, and placing in it a first order lens apparatus, there will be no great necessity for any other sea-coast light until we reach Cape Charles (Smith's Island). The very dangerous shoals extending along this entire coast, at a considerable distance from the low coast, at distances ranging from five to twelve miles, as shown from the recent surveys by the coast survey, make it the duty of the government to cause this light to be increased in power and range to the rank of a first class sea-coast light, without delay.

"Smith's Island Light-house, Cape Charles.—This light is placed on the north-east of Cape Charles, and at the north entrance of Chesapeake Bay. This very important light has at present only 10 lamps and 21-inch reflectors. The dangers at the entrance to Chesapeake Bay render it extremely important that this light should be increased to a first order one. The tower has an elevation of only 55 feet, placed on a very low coast, giving the light, if in other respects good, a range of, not more than 12 nautical miles, which it can seldom reach in consequence of the very inferior illuminating apparatus. This is one of the lights requiring the earliest attention of the light-house department.

"Cape Henry Light-house, Virginia.—This is one of the best reflector lights on the coast. It is situated on the south side of the entrance of Chesapeake Bay, has an elevation of 120 feet, and is fitted with 18 lamps and 21-inch reflectors. It being a prominent leading mark for vessels bound into Chesapeake Bay, Hampton Roads, and their numerous tributaries, every argument would seem to be in favor of its speedy improvement, to render it equal to the best first class lights of other maritime nations.

"Light-house half way between Cape Henry and Body's Island Light.—The large number of shipwrecks and the vast amount of life and property lost annually on this coast should be a sufficient reason for erecting and maintaining a first class sea-coast light on some eligible site in this vicinity. The Body's Island Light is badly located, and insufficient in power and range to subserve fully the requirements of commerce and navigation. Vessels bound south from the eastward run to make this coast, with the view to avoid the opposing currents of the Gulf Stream, and, at the same time, to avail of the favorable currents within the limits of the cold wall bounding the Gulf Stream. The trend of the coasts on either side of the Chesapeake

Bay renders navigation more dangerous than it would otherwise be; and therefore it becomes the more important to light well the entire coast from Cape Hatteras to Cape Henlopen.

"Body's Island Light-house, North Carolina.—This light has already been referred to. It is of great importance, especially to the coasting trade, and would be of much more if it were increased to a first class light. It is now fitted with 14 lamps and 21-inch reflectors, revolving, with an elevation of $56\frac{1}{2}$ feet, giving it a range of about 12 nautical miles. This, in addition to the proposed sea-coast light between it and Cape Henry, would, if properly fitted, save the life of many a gallant seaman, and millions of dollars' worth of property to the country.

"Cape Hatteras Light-house, North Carolina.—There is perhaps no light on the entire coast of the United States of greater value to the commerce and navigation of the country than this. That it is not such a light as any sea-coast light should be is too apparent to require much argument; while its special requirement, having reference to the Gulf Stream, the currents and counter-currents which sweep past it, and the very dangerous shoals, extending to the distance of 10 nautical miles from the light, all tend to make it one of no ordinary importance. Vessels propelled both by wind and steam run for soundings off this cape; and it is of the first importance to navigators wishing to make quick passages, that they should see this light in going south. At present it is of very little use, in consequence of its limited range. Navigators do not, as a general rule, rely upon it sufficiently to warrant them in running for it. It is fitted with 15 lamps and 21-inch reflectors, having an elevation of about 95 feet, which would give it a range, under favorable circumstances, of $14\frac{1}{2}$ nautical miles, provided the apparatus for illuminating was of the best description. There is no single light on the coast believed to require renovation more than this does. An elevation of 150 feet, and a first class illuminating apparatus, are imperiously demanded, and without any unnecessary delay.

"Cape Lookout Light-house, North Carolina.—This is at present a fixed light, fitted with 13 lamps and 21-inch reflectors, and elevated 95 feet above the level of the sea. In consideration of the manner in which navigators have to follow this low coast, this light becomes, necessarily, one of the important sea-coast lights, and requires to be elevated and improved to that extent. The shoals of this cape are of such a character as to render it a very important light.

"New River Inlet, North Carolina.—The great distance from Cape Lookout to Cape Fear, and the dangerous shoals extending to such a great distance from them, without any prominent mark intervening to guide navigators, render it necessary, in making up a general plan for lighting the entire sea-coast, to include a first class light, to be placed somewhere in the vicinity of New River Inlet. The coast between Capes Hatteras and Fear forms a curve, but not to such a degree as to render a light near this point unnecessary. Although the necessity for this proposed light may not be considered as pressing, yet in a well-devised scheme it can not be entirely omitted.

"Bald Head, Cape Fear, North Carolina.—This light in its present position and with its present apparatus, etc., is comparatively useless. The apparatus, 15 lamps and 21-inch reflectors, is inadequate to the requirements of the service of an ordinary sea-coast light, while this is one of the special cases requiring extraordinary means to insure any amount of good. The tower is nearly 4 miles from the pitch of the cape, and 20 nautical miles from 10 fathoms water, in a direct line on the end of the 'Frying Pan shoals,' which extend continuously from the pitch of the cape. The assumed elevation of the light is 110 feet, which, with good illuminating apparatus, would give a range, un-

der the most favorable circumstances, of 17 to 17½ nautical miles. Careful observation has, however, shown that it is very seldom seen 12 miles; and then only resembling a star of the fifth or sixth magnitude. This light is considered by the pilots as of very little, if indeed of any use at all, for the local purposes of the harbor; while it is perfectly clear that it is of no value to the navigator in guiding him around and clear of these shoals, which, in the opinion of navigators, are only exceeded in importance by those off Nantucket. This light should either be reduced to a mere harbor light, or removed to the pitch of the cape, and given an elevation sufficient to insure a first order light being seen, under ordinary circumstances, outside of the shoals. This light as a first-class sea-coast light, and a first-class light-vessel placed on the shoals, would tend greatly toward increasing the safety of navigation.

"Cape Romain, South Carolina.—The dangerous shoals off this point render this an important light to navigators bound to Charleston, and as far south as St. Augustine. To save the current, and to keep out of the influence of the current of the Gulf Stream, navigators run for soundings off the Cape Romain shoals. A first-class light would tend greatly to lessen the hazards of this navigation. The present light, fitted with only 11 lamps and 21-inch reflectors, at an elevation of only 87 feet, can not be seen with any degree of certainty at a greater distance, under the most favorable circumstances, than about 14 nautical miles, which is by no means far enough to enable navigators to run their vessels with that boldness which is essential to success. This light, in point of power, brilliancy and range, is not superior to a fourth order lens.

"Charleston Light-house, South Carolina.—This important light is fitted with only 12 lamps and 21-inch reflectors; revolving, with an elevation of about 125 feet. Its greatest range about 16 miles. The necessity for a first order lens apparatus for this light is too apparent to require more than a bare reference to the chart. This light should be changed to a fixed light, and the lights on either side of it changed in their characteristic distinctions, for the reason that it is used as a range with the beacon-light for crossing the bar. Revolving lights are not adapted to this purpose, especially where channels are narrow and the eclipses of long duration.

"Hunting Island, Georgia.—This point is one of the positions selected for new lights in carrying out the general programme. Distant 33 miles from Charleston, South Carolina, and about midway between the Charleston and Tybee lights.

"Tybee Light.—This is an important light both in a general and local point of view. For the over-sea voyager along the coast, it is of equal importance to those generally on the coast for local purposes, as the guide to the entrance to Savannah River. This light at present is fitted with 15 lamps and 16-inch reflectors, and has an elevation of 100 feet. This light, in consideration of the sameness in the appearance of the coast, should be well distinguished and improved to the extent of making it a first order light.

"Sapelo Island Light-house.—This light is 46 miles from Tybee light, and comes into the list embracing the general programme. As a sea-coast light, its importance will appear clearly by referring to the chart, and in a local point of view it is the mark to guide vessels into the important inland-waters constituting Doboy Sound. This is at present a light fitted with 15 lamps and 15-inch reflectors, elevated 74 feet above the level of the sea, and is revolving. Its greatest range now, will not exceed 18½ nautical miles. As a sea-coast light, it should be seen clearly and distinctly at the distance of 20 nautical miles.

"Amelia Island Light-house, Florida.—This light, 41 miles from Sapelo light-house, is another of the proposed sea-coast lights. It is at present fitted with

14 lamps and 15-inch reflectors; a revolving light, having an elevation of about 60 feet, and a consequent range for the best description of apparatus, of 13 nautical miles. The tower requires to be elevated, and in other respects improved, to the extent of making it a first-class sea-coast light.

"St. Augustine Light-house.—This light, being 50 miles from the Amelia Island light, is included in the list of sea-coast lights. The present light is one of a merely local character, being fitted with only 10 lamps and small reflectors.

"Mosquito Bar.—A light is proposed to be placed in this vicinity. Although its immediate necessity is not apparent, yet in time it will become necessary to erect a sea-coast light half-way between St. Augustine and Cape Canaveral. This point is 50 miles from St. Augustine, and 43 miles from Cape Canaveral.

"Cape Canaveral.—This is one of the prominent points on the coast, requiring the most powerful sea-coast lights to facilitate navigation. Dangerous shoals extend to a considerable distance off this cape, rendering it still more important that a first order light should be substituted for the present very inefficient one. The present apparatus consists of 15 lamps and 21-inch reflectors, revolving, in a tower of only 55 feet elevation. The present range of this light does not exceed 12 nautical miles, and should be increased to not less than 20 nautical miles.

"Cape Florida.—Between this and Cape Canaveral it is proposed to erect 3 new sea-coast lights of the first order; one near Jupiter Inlet is considered of immediate importance; and the other two at different periods, according to circumstances, and as the expenditures for light-house service on other points may warrant. The Cape Florida light, marking, as it does, a prominent point on a most dangerous coast, should necessarily be of the most powerful illuminating apparatus. The present apparatus is composed of 17 lamps and 21-inch reflectors, with an elevation of 70 feet above the level of the sea, giving a range of not more than 13 nautical miles. The currents and dangerous reefs along the Florida coast, render it of absolute importance that it should be increased to the rank of a first-class sea-coast light.

"Carysfort Reef and Sand Key Lights.—These two important lights are now in course of construction by the officers of the Topographical Engineers, to be fitted with first order lens apparatus.

"Dry Bank.—This position has been selected as an intermediate point for a first-class light midway between Carysfort Reef and Sand Key lights, at the distance of 48 miles from them. It is believed to be of the first importance that the entire Florida coast should be lighted with the lens apparatus of the greatest power, without delay.

"Dry Tortugas.—This is a very important light, especially to those navigators bound to and from the Gulf of Mexico. It is fitted at present with 17 lamps and 21-inch reflectors, with an elevation of 70 feet, giving a range of about 13 nautical miles. This light is 55 miles from Sand Key, which makes it still more important that it should be of the first order.

"Pensacola Light-house.—This light is deficient in power, being fitted with only 10 lamps and 16-inch reflectors. This and the light at Mobile Point, being about 40 miles apart, are both revolving. As an important naval station, Pensacola requires a first-class sea-coast light. The present light is very little better than the ordinary local lights along the coast. The distinction of this light should be changed, as it is liable to be mistaken for the one at Mobile Point. The proposed lights along the Florida coast, from the Keys and Dry Tortugas to Pensacola, etc., although necessary in a general plan, are not deemed to be of present great importance. With the increase of trade and population, the coast must keep pace in its improvements in lighting.

"Mobile Point.—This is believed to be the best reflector-light on the coast; being revolving, and fitted with 21 lamps and 21-inch reflectors. The elevation of this light being only 55 feet, its range is necessarily restricted within the very narrow limits of only 12 nautical miles. This light, from a proper elevation, could be seen at a distance of 18 to 20 miles. This tower should be elevated to at least 125 feet, to render the light of as much importance as the navigation interests of Mobile demand. This light may be easily mistaken for the one at Pensacola, and therefore the characteristic distinction of one of them should be changed. In carrying out the general plan, it may become a question as to whether Mobile Point or Sand Island light should be the principal or sea-coast light.

"Passes of the Mississippi.—These lights should be of the first class, with such elevations as will give them the ranges of at least 20 nautical miles. The present lights are inefficient, and unnecessarily expensive, without any commensurate benefits. These lights are of great importance to the commerce of the Gulf of Mexico, and should be rendered the most efficient in the shortest space of time. The remaining lights along the coast, embraced in the programme, are of minor importance, compared to those already enumerated; but deserve the attention of those who are, or may be, charged with the light-house service. Many of the points along the coast of Texas require lights, especially at the entrances to the ports and bays, at an early day. The prominent points on the Pacific coast should have lights without unnecessary delay, and no sea-coast light should be fitted except with first-class apparatus.

"Lake Coast. Champlain, Ontario, Erie, Huron, Michigan, Superior, and their tributaries or connecting links.—The shores of these inland seas belonging to the United States, are, so far as the number of the lights is concerned, pretty well lighted. There are a few important points which require lights of greater power and range than those now existing; and as commerce and navigation increase there, a few additional small lights may be required, to the extent probably of 6 in Michigan, 1 in Ontario, 3 in Huron, and several in Superior. The most of these lights are mere pier-head beacons. A system arranging the lights into classes, and giving to each one a distinctive characteristic, is necessary. In Lake Huron, the two important lights of Thunder Bay Island and Point aux Barques, distant about 22 miles, and marking the entrance to Saginaw Bay, are both fixed.

"Many of these lake lights have more lamps and reflectors, although only requiring to have short ranges, than many sea-coast lights on the Atlantic and Gulf coasts. Galloo Island, east end of Lake Ontario, near the River St. Lawrence, is fitted with 15 lamps and reflectors; in Lake Superior, Manitou Island, 15 lamps and reflectors; White Fish Point, 13; and Copper Harbor, 13 lamps and reflectors. These principal lights on the lakes should be fitted with third order lenses, of smaller or larger model, according to circumstances, similar to the one recently placed in the Wagooshance Light, built under the direction of the Topographical Bureau. The following may be considered first-class lake lights, and should be of the third order lens apparatus, viz.: Galloo Island, Lake Ontario, fixed; Sodus Bay, Lake Ontario, revolving; Fort Niagara, Lake Ontario, fixed; Dunkirk, Lake Erie, fixed; Presq' Isle, Lake Erie, fixed; Cleveland, Lake Erie, fixed; Western Sister, Lake Erie, fixed; Buffalo, Lake Erie, fixed; Point aux Barques, Lake Huron, fixed; Thunder Bay Island, Lake Huron, fixed; Presq' Isle, Lake Huron, revolving; Point de Tour, Lake Huron, fixed; Wagooshance, Lake Michigan, third order lens; Fox Isles, Lake Michigan, required; South Manitou Island, Lake Michigan, fixed; Milwaukee, Lake Michigan, fixed; Chicago, Lake Michigan, fixed; White Fish Point, Lake Superior,

fixed; Copper Harbor, Lake Superior, fixed; Manitou Island, Lake Superior, fixed.

"Of the 72 lights on the lakes and their tributaries, 68 are fixed and 4 revolving.

"Arrangement into one System in reference to Classification.—The following classification of lights is recommended according to their positions, uses, etc., etc.: 1. Main coast lights for the most prominent points on the coast. 2. Secondary lights for the inferior points on the coasts, and in broad sounds, bays, etc. 3. Minor sounds and bays, and for harbors and river lights. 4. Range, beacon, and pier lights. Also into six classes, according to the dimensions of the lighting apparatus and the range of the lights. All the main sea-coast lights should be of the first order, and the classes to which the secondary, sound, bay, harbor, river, range, beacon, and pier lights should belong, would be determined by the light-house board, according to the locality, objects for which placed, etc., etc. This applies to new lights, and to the gradual replacing of the old ones as they may require renewal. It is believed that many of the present lights might be dispensed with if effective ones were substituted for those now placed on important points, but not of sufficient power and range, which would in the end produce a considerable saving.

"Distinctive Characteristics.—Experiments will throw light on this important subject. The light-houses and vessels, as well as the lights, should be distinguished from each other by sight, as well as, in case of fogs, by sound. Colors should only be used for distinguishing small lights of short range, as river, pier, beacon, or range lights. In employing colored media at all for lights, it is important that the most approved modes, with the best quality of appliances, only be used; a duty which should devolve upon professional men. Mr. Stevens enumerates the number of distinctions of which reflecting lights are susceptible as nine: 1st, fixed; 2d, revolving white; 3d, revolving red and white; 4th, revolving red with two whites; 5th, revolving white with two reds; 6th, flashing; 7th, intermitting; 8th, double fixed light; 9th, double revolving white lights; to which may be added, 10th, double, one fixed and one revolving. Of these, three depend on color and should be discarded, reducing the distinctions to seven. In the Scottish lights, by causing a rapid revolution of the frame, and placing the rims of the mirrors of each side in one vertical plane, while their axes are in a plane inclined to the vertical, flashes are produced every five seconds, which appear to rise and sink. The intermitting light suddenly appears, is steady for a short time, and then disappears suddenly. These changes are produced by the vertical motion of circular shades in front of the reflectors. The different characteristic combinations in the lens system, according to M. L. Fresnel, are nine: 1st, flashing at the interval of a minute; 2d, flashing at the interval of half a minute; 3d, white and red flashes alternating; 4th, fixed lights flashing every five minutes; 5th, flashing every three minutes; 6th, every two minutes; 7th, fixed white lights with red flashes; 8th, fixed white lights; 9th, double fixed lights. These are applied only to the first three orders of lights. In England the lights are classified as sea-coast, secondary, and harbor and river lights. In France they are divided into six orders, according to their range and the size of the lighting apparatus; the first order being the largest, and the second, third and fourth orders being each divided into two classes, the larger and smaller, or first and second classes. The objections to colored lights are, the large absorption of the incident light, and the difficulty of distinguishing the color. Red is admitted to be the best color. A good red light is seen 16 miles, and sometimes 22. Green lights from a powerful apparatus, in Mr. Stevenson's experiments, were seen 7 miles in very clear weather, and blue lights only 5.

"The objections to red are: 1. The great loss of light by absorption. A full red glass used as a chimney of a lamp absorbed 80 per cent. of the whole. A pink French glass absorbed but 57 per cent. of the light, but the light was not characteristic.

"2. White lights grow reddish in a fog. In a revolving light, showing alternately red and white, the red is absorbed at a less distance than the white, and the light may be mistaken for a white light of half the period of revolution. Two lights will appear blended in one, which are not separated by at least $3' 18''$; call H the required distance between the lights in feet, Δ the observer's distance in feet, Θ half of $3' 18''$. Then $H = 2 \Delta \tan. \Theta$. For 1 mile, $H = 5.84$ feet, and for n miles $H = n \times 5.84$. Leading, or range lights, should be nearly on the same elevation, so as to cause them to appear nearly, but not quite in one. The distance between them should not be less than one sixth of the distance at which they are thus to be used.

"In forming a programme for lighting the coast, the following conditions should be realized: 1. The most prominent points should be first lighted. 2. Revolving lights, as more powerful than fixed, should be used, when possible, on the projecting points. 3. Lights identical in appearance should not occur within 80 to 100 miles of each other. 4. Distinctions of color should not be adopted except in cases of absolute necessity. 5. As few lights as possible should be used, not only for the sake of economy, but to avoid confusion. 6. Distinctions of lights depending on the estimations of small differences of time, of appearance and disappearance, should never be resorted to. 7. Harbor or local lights should generally be fixed, and may be distinguished by colors. 8. Floating lights should never be used when fixed lights can be employed.

"The system proposed by Charles Babbage, Esq., of London, and which has been communicated by its distinguished author to the Board, at the request of one of its members, is to distinguish lights by occultations; or, to make each light-house repeat its own number continually during the whole time it is lighted. This is accomplished by inclosing the upper part of the glass cylinder of the Argand burner by a thin tube of tin or brass, which, when made to descend slowly before the flame, and then allowed suddenly to start back, will cause an occultation and reappearance of the light.

"The number belonging to a light-house may be thus indicated to distant vessels. Take, as an example, 243. 1. Let there be two occultations. 2. A short pause. 3. Four occultations. 4. A short pause. 5. Three occultations. 6. A longer interval of time. This system of occultations may be repeated all night by means of proper mechanism.

"The rapidity of the occultations themselves, the length of the pauses between the units and tens and between the tens and hundreds, as well as the duration of the long interval of time which marks the termination of the number, must be made the subject of experiment. A light has been already used as an illustration, in which the occultations occurred at intervals of one second; the pauses occupied four and the long interval ten seconds. The pause was thought to be unnecessarily long, and was diminished. Whatever may be the times ultimately adopted, the experiments already made render it improbable that the average time required by a light-house for repeating its number should amount to one minute. It is by no means necessary that the counting of the number of a light-house should commence with the digit which expresses hundreds. No greater amount of time would have elapsed, if, in the above instance, the observer had commenced with counting the unit's figure. It would then have read thus: (three occultations) long interval; (two occultations) pause; (four occultations) pause. By the long interval denoting the com-

mencement of a number, it is already apparent that the number of the light-house is 243, and not 324. In order still further to prevent mistakes arising from an incidental error in counting the number of occultations, it will be convenient to establish another principle for the purpose of numbering the light-houses. Light-houses must not be numbered in the order of their position; but every light-house must have such a number assigned to it, that no digit occurring in the number denoting the several light-houses nearest to it on either side shall have the same digit in the same places of figures.

"If five adjacent light-houses were thus numbered; 361, 517, 243, 876, 182;

supposing a mistake to have occurred in the first time of counting 243, and that it had been reported to the master of the vessel as 253, he would immediately, on looking at his numerical list of light-houses, perceive that a mistake had been made in the middle figure; because, in any general arrangement, 253 would have been assigned to some light-house on a coast very distant from that on which 243 was placed. In fact, two out of any three figures would always detect the error of the third.

"The occultations would distinguish every light-house from all casual lights, and their number would identify the light. The whole illuminating power would be always employed, undiminished by the interposition of colored glass. These lights would be more readily visible at a distance, because it is known that the eye perceives more readily a faint light which is intermittent than an equal light which is fixed. The Board regard this as the most important proposition for distinguishing lights which has ever been made, and propose to make full experimental trials of it. In fogs, Mr. Babbage proposes to make the pauses between the strokes of the gong take the places of the occultations of the light. To give this plan a full development, all nations should unite in a system of numbering for light-houses. Such a co-operation might reasonably be looked for, if the plan have all the success which is now expected.

"*Best mode of ascertaining the necessity for introducing new Lights, Beacons, etc.*—Legislation is, of course, necessary to the establishment of a new light. The recommendations of the Light-house Board, of officers of the coast survey, of pilots, navigators, and others, all reach the Committees of Commerce of the two Houses of Congress, through different appropriate channels. It does not seem practicable to propose any system of examination of sites which would not be very expensive, while legislation is pending on the subject. A reference to the Light-house Board, in doubtful cases, would secure the committees from recommending appropriations for objects which certainly would not have the approval of professional men. The law of the last session provided for the examination of sites, for which appropriations were made, by the officers of the coast survey, and a report by the superintendent. As this will leave a full knowledge of all the circumstances of the case, and be attended with very little expense, the same plan should be pursued in all future cases.

"*Best mode of supplying new Lights.*—When it has been shown, to the satisfaction of Congress, that new lights are required, and appropriations made for the purpose, the plans and specifications for construction, illuminating apparatus, distinction, etc., should be made by the engineer of the Light-house Board. Should a previous estimate have been made by this engineer, for the information of Congress, generally, there will be required but little more than to fill up the details. The construction having been approved by the Light-house Board, a contract should be entered into, according to law—based entirely upon the plans, drawings, and specifications and estimates of the engineer—and the building should be erected, and the lighting appa-

ratu and accessories be procured, under the inspection of the engineer of the Board, or of such officer of the corps of engineers of the army as may be detailed for the purpose, in conformity to the 9th section of the act approved 3d March, 1851. All the details should be subject to similar inspection.

"Mode of renovating Lights.—Whenever the Light-house Board is satisfied of the necessity for renovating any existing light, by the introduction of better illuminating apparatus, etc., the engineer of the Board should be required to prepare estimates and plans in detail, to be submitted to the board, which should be passed upon, and, if approved, the necessary steps should be taken to make the repairs, etc., according to law; or, in the event of the expense being too great to admit of the works being done, except by a special appropriation, then the necessary estimates, explanations, etc., should be prepared and submitted, through the Secretary of the Treasury, for the consideration of Congress. It should also be the duty of the Board to procure all the necessary information relating to the establishment of new lights, abolishment of old ones, etc.; to be accompanied by estimates of cost, to be submitted, through the Secretary of the Treasury, to Congress, at the commencement of each session.

"Discontinuance of unnecessary Lights.—The steps in regard to the discontinuance of lights should be similar to those necessary in cases of renovation of lights.

"Subjects of Instruction to Employees.—Inspectors and light-keepers should be provided with printed instructions, in the form of manuals of instruction, as well as those necessary to guide them in the police of the establishments, similar to those provided for the inspectors and keepers of light-houses in France and Great Britain. This manual should embrace a detailed account of the modes of executing every part of the duties confined to the inspectors and keepers; a description of the parts of the machinery employed; and the means to be employed, in case of accident to the machinery, etc., until it can be repaired. The instructions for the light-house service of France embrace every point in the most minute detail, and serve not only for the guidance of inspectors and keepers, but also of the engineers and others in any way connected with the service. The instructions for light-houses, light-vessels, etc., of England, are full and explicit; printed in large type, with conspicuous headings; and are kept in the quarters of the keepers, in frames, so that no one can ever be at a loss to know his duty. The different kinds of lamps employed are described, and the modes of attending to them pointed out, in plain, clear, and explicit terms, adapted especially to the understandings of the keepers of the lights. The subjects contained in the printed instructions and manuals, would form a part of the essentials in the examinations for qualifications of keepers.

"Best Mode of securing Attention to Instructions.—The system of inspection already recommended, the examinations for higher positions in the districts, and the exercise of the present power of removal for neglect or disobedience of instructions, would secure a due degree of attention to them. If promotions were made entirely by merit, on the recommendation of the general or local inspectors, and changes, not depending upon want of qualification, were avoided, there would be doubtless, great improvement in the knowledge, skill, and attention of the light-keepers.

"Improvements in the Materials for Illumination.—In regard to the substitution of the oil of colza (rape-seed), now used exclusively for light-house purposes in France, England, Scotland, and Ireland, and in most of the light-houses of the other maritime nations, for spermaceti oil, or, more properly, for that used in our lights, the Board would refer to the fact, that the recommendation of the select committee of the House of Commons of Great Britain, in 1845, to the Light-

house Board, to introduce the more economical oil of colza into their light-house establishments, had the effect of causing a thorough experimental examination to be made of the two oils (colza and the best winter-strained sperm oil), by Professor Faraday, Mr. Alan Stevenson, and others interested in light-house service, by which it was clearly demonstrated that the colza oil is superior, in every essential particular, to the best winter-strained sperm oil. Professor Faraday says, in his report: 'Having burnt the lamps for many days, I have been much struck by the great steadiness of the rape oil lamps, either as considered alone or in comparison with the sperm-oil lamps. They would burn for 12 or 14 hours at a time with little or no alteration of the light, the cottons or lamps not being touched the whole time; whereas the sperm oil lamps would in the course of four, five, or six hours, give a diminished flame, from the incrustation of the charred part of the cotton retarding the flow of oil. In the rape oil lamps the coal is broken and porous, and serves for wick almost as well as the fresh cotton; but in the sperm oil lamps the coal forms a hard, continuous ring, which seals up the ends of the threads; and this, with the more confined condition of the burner, and the greater distance of the oil beneath (from intentional difference of flow in the lamps), causes the sperm oil lamp flame to fail in brightness, and requires that the wick should be re-trimmed.'

* * * I have made many careful experiments on the proportion of light produced by the two kinds of lamps, in every case weighing the oil before and after combustion, so as to know exactly the quantity burned, and making, during the experiments, above 100 comparisons of the lights one with another. The rape oil lamps were always more brilliant than the sperm oil lamps, except, indeed, one or two rare cases; but, at the same time, more oil was burned in them. * * * From 108 observations of the lights, taken at such times as appeared fitted to give the best mean expression of the light of the lamps compared with the oil burned in them, the average light of the rape oil lamp came out as one and a half, that of the sperm oil lamp being one.' Mr. Alan Stevenson says: 'In my last annual report on the state of the light-houses, I directed the attention of the Board to the propriety of making trial, at several stations, of the patent colza or rape-seed oil, prepared by Messrs. Briggs, of Bishopsgate-street. These trials have now been made, during the months of January and February, at three catoptric and three dioptric lights.'

* * * The substantial agreement of all the reports, as to the qualities of the oil, renders it needless to enter into any details as to the slightly-varying circumstances of each case; and I have, therefore, great satisfaction in briefly stating, as follows, the very favorable conclusions at which I have arrived: 1. The colza oil possesses the advantage of remaining fluid at temperatures which thicken the spermaceti oil, so that it requires the application of the frost-lamp. * * * 3. The colza oil burns, both in the Fresnel lamp and the single Argand burner, with a thick wick, during 17 hours, without requiring any coaling of the wick or any adjustment of the damper, and the flame seems to be more steady and free from flickering than that from spermaceti oil. 4. There seems (most probably owing to the greater steadiness of the flame) to be less breakage of glass chimneys with the colza than with the sperm oil. 5. The consumption of oil, in so far as that can be ascertained during so short a period of trial, seems, in the Fresnel lamp, to be 121 for colza and 114 for spermaceti; while in the common Argand lamp, the consumption appears to be 910 for colza and 902 for spermaceti. 6. If we may assume the means of these numbers, 515 for colza and 508 for spermaceti, as representing the relative expenditure of these oils, and if the price of the colza is 3s. 9d., while that of spermaceti is 6s. 9d.

per imperial gallon, we shall have a saving in the ratio of 1 to 1.775, which, at the present rate of supply for the Northern lights, would give a saving of about £8226 per annum.' The evidence of these two distinguished gentlemen is conclusive of the superiority of the colza or rape-seed oil to the best winter-strained sperm oil; and how much better than that used in our lights, may be readily inferred without the aid of experiments on so nice a scale as these employed by Professor Faraday and Mr. Stevenson, when it is remembered that our lights are supplied with oil called winter and spring or summer oil. That efficient lights along the coasts of all maritime countries are essential to a safe navigation, and the successful prosecution of a lucrative commerce, will not be contested; that all mere personal or local interests should give way to the general good, is an assumption which will not meet with disfavor in this country; and inasmuch as it is of paramount importance to the best interests of the whole country, that our lights and other aids to navigation should be the best which money, science, and the mechanic arts will afford, it is, in the opinion of the Board, the duty of those charged with this important branch of the public service to employ every reasonable means, not inconsistent with law, to perfect them, and therefore recommend that the subject of introducing other combustibles than the oil now used, be taken into serious consideration, as one of the means of improving our lights, and, at the same time, of effecting considerable annual saving of expense to the country. If the rape-seed were cultivated to any extent in this country, it is not doubted it would supply the place of the numerous chemical oils, fluids, etc., now in general use for domestic purposes, as well as for lighting our light-houses and light-vessels. To insure the consummation of so desirable an object as the cultivation of this plant on a large scale in this country, where climate and soil are so well adapted to it, will be to place it in a fair competition with its rivals. It will be the duty of the Board, if authorized by Congress, among its numerous other important duties connected with the light-house establishment, to examine into the merits of all proposed improvements in apparatus and combustibles, and, by their recommendations to Congress, keep pace with the improvements of other countries in this branch. The introduction of gas into light-houses has long been looked forward to as an important step. Hitherto it has met with but little favor in any quarter. While the introduction of gas into our light-houses, if found adaptable to them, would involve important points to be considered, it is by no means certain that by the means of a series of experiments, the Board would not be enabled to decide conclusively as to the practicability of making the attempt in the present state of knowledge, or the best and safest means of generating, conducting, and continuing it for light-house purposes. The persons charged with the few gas-lights now existing in this country, for want of practical and theoretical knowledge, it is believed, are not competent to report results sufficiently reliable to decide so important a question.

"Buoys."—The material is iron or wood, sometimes covered with copper. The anchors are heavy blocks of stone, or mushroom anchors, or iron sinkers (which should be hollowed out below), or iron screws. It is worth trial whether fastening the buoys by a traverse line passing through the centre of oscillation would not diminish the liability to chafe off the chain, and separate the buoy from the anchor. A swivel-shackle, in a degree, prevents this, but not effectually. The colors of buoys are made to indicate their purpose, as designating a channel, shoal, spit, etc. They are sometimes even characteristically marked to distinguish them. The law passed in 1850, in regard to coloring and numbering buoys in the United States, is simple and effective. The numbers were intended to

begin at the exterior of a bay, harbor, etc. This law is as follows: Extract from an act making appropriation for light-houses, light vessels, buoys, etc., and providing for the creation and establishment of the same, and for other purposes, approved September 28, 1850: 'Section 6. *And be it further enacted*, That hereafter all buoys along the coast, or in the bays, harbors, sounds, or channels, shall be colored and numbered, so that, passing up the coast, or sound, or entering the bay, harbor, or channel, red buoys with even numbers shall be passed on the starboard hand; black buoys with uneven numbers, on the port hand; and buoys with red and black stripes, on either hand. Buoys in channel ways to be colored with alternate white and black perpendicular stripes.' Of course the buoys show, with more or less distinctness, when projected on the water, against the sky, trees, etc. The red buoys should be painted a bright red, and not a Spanish brown, in order to be well distinguished—red lead or vermilion being used as the paint. The experiments and observations of the Board satisfied them that in such a case, red and black were good colors for distinguishing buoys. The can-buoys, in some instances (as in New York harbor) are too small to be easily seen. The numbering is a simple matter, but is by no means effectively executed, especially on the spar-buoys, where the numbers repeated on the different sides, being seen in range in a diagonal view, lead to confusion. The Board have given some attention to plans for numbering buoys. The numbers should be placed above the buoys, on stems or perches; should present the same appearance on different sides, and have their distinctions by difference in a vertical line, and not by varying horizontally. Several plans have occurred to them. Three solids, the cone, cylinder, and sphere, arranged in groups of not more than 3 each, will give 42 combinations; no one of these figures can be taken for the other, and they may easily be placed on stems projecting nearly vertically above the buoy, the several solids being placed one above the other, with a sufficient interval. They can be of adequate size, and may be cheaply made in the turning lathe. The elementary forms of the unit, the 5 and the 10, of the Roman numerals, are the cylinder, the cone and the double cone. By combinations of these, 89 numbers are represented. Seven numbers may be represented by 2 signs and their combinations; 28 by 3 signs, restricting the number of elements in any one combination, to 4. Seven numbers of every 10 may be represented by only 2 more signs than those expressing the value of the ten's place, giving a very great variety. A letter made to revolve about a vertical axis, produces a solid of revolution which is easily recognized as the sign for the letter. Fourteen of the twenty-six letters are adapted to characteristic signs, as shown in the figures (A, B, E, I, J, L, O, P, Q, R, T, W, V, Y). Nine digits of the Arabic numerals, viz.: 1, 2, 4, 5, 6, 7, 8, 9, and 0, give easily formed and easily recognized signs, as is shown in the accompanying plate; and these the Board recommend for numbering buoys, excluding 3 as not sufficiently characteristic. In the English system of placing buoys, a red and black are placed on opposite sides of a channel, and the vessel runs between them. In our system only one buoy is placed on the starboard or port hand, and the vessel runs for the buoy, keeping it close aboard in passing. The English system is most simple, and even the most economical. In order to render buoys available at night, various propositions have been made for causing them to appear luminous, but none have succeeded practically. Lighting by gas is among the methods proposed.

"Of Fog Signals."—During the prevalence of fogs, the lights which ought to guide the seaman are often indistinctly seen, or entirely obscured, until he has approached too near the danger against which they were intended to warn him. In cases of fog, light-

ships and light-houses are, in some instances, provided with gongs and bells, which are then kept constantly sounding. It is unfortunate that the means of warning the seaman of his danger should extend to the shortest distance when that danger is most imminent. The lights usually employed are visible at a distance of from 6 to 80 miles; but the sound of a gong or bell is heard at a comparatively very small distance. When these instruments are heard, they merely indicate danger, but not its exact nature. It might, in some cases, be of great importance that the gong or bell should indicate the number of the light-ship. This could be accomplished by a very trifling alteration in the mechanism. Instead of striking the instrument at fixed intervals, let there be pauses and a long interval between the number of strokes which successively represent the digits of the number of the light-ships, just in the same manner as has been proposed for light-houses. A light-house or light-ship whose number is 243, would be thus indicated during fog: three blows on gong, pause; four blows on gong, pause; two blows on gong, long interval. The same mechanism which caused the occultations of the light might produce the blows on the gong. The preceding explanations are sufficient to show that each light-house or light-ship, by continually repeating its own number, might render any mistake of it for a different light very nearly impossible. The great principle on which the system rests is to give numerical expression to each light. If it be not thought necessary to apply it to every light-house, the most important may be chosen for its application. The expense of the alteration, and the amount of danger incurred by a mistake, will furnish the ground of decision in each individual case. In proposing, however, a new system which has extensive bearings on other questions connected with the safety of those who travel on the waters, it is desirable that a general and comprehensive view should be taken of such of its applications as the rapid advance in mechanical and chemical science justify us in supposing must take place in a few years. However partially the system may be adopted at first, a judicious foresight into its probable applications may enable us, without any present inconvenience, to accelerate future improvements, and to save considerable expense on their adoption. The following suggestions for improvements or applications, many of which are perfectly practicable at the present time, are offered for the consideration of those who may be called upon to carry out the *Numerical System of Light-houses*. They are not necessary for the success of the simple plan which has been already described, but may be adopted or rejected without any interference with it.

Suggestions for the Improvement of Light-house Signals, Buoys, etc.—Telegraphic communication during the night between Light-houses, and Ships in distress.—Cases occur in which it is of great consequence that a ship should communicate with the land long before it can send a boat ashore or enter its intended port. It may be the bearer of important intelligence. It may convey some person whose presence is essential for some great object. The vessel itself may be in distress. The state of the elements may render it impossible to send for or receive any assistance from the land; yet, even under such unfavorable circumstances, if directions from skillful pilots, acquainted with the coast, could be conveyed to the ship, its wreck might, perhaps, be prevented; or, if driven on shore, having been directed to the least unfavorable spot, its crew might possibly be saved. Such communications might easily be organized. There are already existing in the royal navy in the East India Company's service, and elsewhere, large dictionaries of numerical signals. These, it is true, are made by flags, or by balls; but the same numbers may be expressed by the occultations of lamps. Any number, however large, may be expressed by making the number of occultations corre-

sponding to the first or highest digit, then allowing a pause; after which the number of occultations representing the second digit, then a pause; and so on, always observing that, after the unit's figure has been expressed, there must follow a long interval.

"The plan for telegraphic communications would be thus arranged: 1. Light-house repeating its own number. 2. Ship fires a gun, and hoists a light, to call the attention of the light-keeper. 3. Light-house ceases repeating its number, and becomes a steady light, thus informing the ship that it is observed. 4. Ship having prepared its message, numerically expresses it by the occultations of its own lamp. 5. Light-house repeats the message of ship, in order to show that it has been rightly understood. 6. Light-house now repeats its own number, while it is preparing the answer. 7. Light-house expresses its answer by occultations. 8. Ship repeats the answer. This interchange of question and answer is continued as long as necessary, during which the light-house repeats its own number previously to each reply.

"Very little delay will occur; for these questions and answers will be arranged on movable discs, which may be placed in the mechanism employed for occulting, even while it is repeating another message. Many such discs, each containing a different message, may be placed in the machine at once, and on touching any lever the light will continue repeating the corresponding message. In case of a ship in distress, for instance, requiring an anchor of given weight, it may be necessary to send to the harbor-master of the adjacent port to give the order, and to ascertain the time when it can reach the vessel. During this interval, the light-house will be repeating its own number. An electric telegraph from the light-house to the dwelling of the harbor-master would save much time, and, in some cases, much damage. The gun fired by the vessel might also be heard by the harbor-master; and his attention then being directed to the telegraph light-house, the whole time might be saved. If even his own house was invisible to the ship, but within view of the light-house, he might, by means of a small light, correspond with the ship, through the intervention of the light-house, repeating the signals of both parties. Colored shades might, if thought expedient, be used for different dictionaries; or an entirely independent lantern might be specially devoted to signals; but this would cause additional expense, and seems unnecessary. It may be objected to this plan, that it would mislead other vessels on first coming in sight of the light-house. This objection, however, will be found on examination to be invalid; for a ship on first getting sight of a light-house, will be at the distance of many miles; and as all telegraphic messages would consist of more than three places of figures, the ship would immediately perceive that the light-house was acting telegraphically, and on turning to the dictionary would even become acquainted with its message. Besides, in the course of every three minutes, at least, the light-house would repeat its own number. Thus the ship would always know that it was in the presence of a light-house; and if its reckoning did not enable it identify the light, it could only remain in doubt during a few minutes.

"*Telegraphic Signals between Ships at night.*—The application of the system of occultations to ships at sea may not perhaps be quite so easy as that which is proposed for light-houses, but no objection has yet occurred which appears at all insurmountable. The question of the position of the occulted light or lights placed on the ship must be settled by practical men, after due consideration and experiment. It may, however, be suggested, that a light hid by a mast or sail may yet have its occultations made perfectly apparent by reflection from another sail. If such a system of signals were adopted, fleets might sail in company during the night, each repeating its own number; and

any orders could be conveyed to any individual ship. Specific lights have already been employed to distinguish sailing-vessels from steamers, in order to prevent collisions. By adapting the system of occultations to one or more of the lights of steamers, their character would appear more distinctly, and at greater distances. Perhaps, indeed, it would be better to have the distinctive character of a steam-vessel indicated by a continual enlargement and diminution of its light, rather than by an occultation. Two steamers also would have much less reason for approaching each other, because they could hold any correspondence by signals. They might also, by the same means, convey to each other their intended course long before they approach each other.

"Of a universal Dictionary of Signals.—Whether the system of occultations be generally adopted or not, numerical dictionaries of signals have been found absolutely necessary, and have long been in use. The rapid increase both of ships and of steamers renders some common language for all nations almost a matter of necessity. The concurrence between adjacent nations in numbering their respective light-houses would be essential if any numerical system is adopted for distinguishing them. Such an opportunity ought not to be lost of rendering those discussions still more useful by attempting to organize a plan for a universal system of numerical signals. The first step might, perhaps, be that each nation should supply all questions and answers that ships could ever require for their safety or convenience. Out of these, the duplicates being omitted, the first draught of the naval part of the dictionary might be formed. This being submitted to criticism, would probably itself suggest many additions.

"The questions should be very carefully translated into the languages of all maritime nations, and should be printed in columns for each language. A dictionary of this kind, containing about 5000 terms in ten European languages, was published in 1849 by M. K. P. Ter Reehorst. The words are contained on about 200 double pages; and since each word, of which there are usually about 25 in a page, is numbered, this work might be used as a numerical telegraphic dictionary. If a more general dictionary were undertaken, other considerations arise, and the great questions relating to the philosophy of language must be examined with reference to such a work. It will, however, be sufficiently early to enter on that subject when any steps are seriously taken to accomplish so desirable an object. The continually increasing use of the electric telegraph renders a universal language still more desirable.

"On the Identification of a Light-house.—A case has been more than once suggested to the author, to which it may be desirable to advert in order to point out the course of experiment which may lead to its removal. At certain periods of the year, and on certain coasts, there occur dense fogs. Under these circumstances, it has happened that a vessel has, on a partial and momentary opening in the fog, insufficient to show more than a single occultation, found herself almost close upon a light-house. In such a case, there is neither time nor opportunity to ascertain its number. It may here be remarked, that the assumed danger of going ashore is so imminent that it is not necessary to know the number. It is sufficient for the moment to know that there is a light-house in a certain direction, which is close at hand. It must, however, be admitted, that in common with all received systems of lights, the method of occultations will not furnish a remedy. If a colored light is already employed in particular localities to meet such a case, it will still accomplish the purpose when occultations are applied to it. The danger, although rare, ought, however, to be provided against. The following remarks are suggested to assist in attaining that object:

"The time between two occultations (usually one second) might be doubled in special cases. A little experience would enable most men to recognize the fact after two occultations. If such light-houses were placed alternately with others, no light-house would be mistaken for either of its adjacent neighbors. This plan might be partially extended, but it is liable to objections. Another view may be taken. Is it possible to give a specific character to the occultation itself? It has been found, that if the occultating cylinder descend rather slowly over the lamp, and then, after a *very short* pause, rise suddenly, the effect is best. It has also been observed, when an accidental defect in the apparatus caused the cylinder, after suddenly rising up, to rebound, and again to obscure partially the lamp, that the nature of the occultation was peculiarly characteristic. This peculiarity was very remarkable up to a certain distance, after which it became lost. Almost any form of peculiarity can be given to the occultations by giving proper forms to the cams which govern them. The fact that such peculiarities are not seen until the ship has approached within certain distances, does not appear to present a material difficulty, and may even prove an advantage. It would seem, then, to be desirable to institute a series of experiments to determine the following questions: Can the occultations of a lamp, in which the rapid re-appearance of the light occurs from the falling down of the shade, be distinguished from those in which it occurs in consequence of the rapid rising up of the shade; and if so, at what distance? In some cases the shades might move from right to left, and in this reverse direction. What peculiarities in occultations can be seen at the greatest distances? Among the experiments still required may be mentioned the loss of light resulting from the interposition of colored glasses, and also the proportion of light lost by sacrificing given portions of various parts of the optical apparatus used for concentrating it. This is necessary in order to enable us to judge what portion may be most economically sacrificed in case the space might be required for other purposes. The dangers arising from fogs are of such an extent that all the resources of science ought to be called in to remove them. Voltaic light can scarcely be depended upon except under continual superintendence; it would therefore be expensive. If, however, any intense light can be found capable of penetrating dense fogs, it might, during their continuance, be good economy to employ it even at considerable expense. Perhaps the ordinary light-house lamps might be supplied with oxygen during fogs; its expenditure being regulated by the obscurity to be penetrated. Possibly portions of phosphorus might be burnt in oxygen, and the light-house would then express its number by a series of *flashes*, and of *pauses* between them. The new form which that body is now known to assume, might render its application to this purpose free from danger.

"On Sounds used for Signals.—Both gongs and bells are employed as substitutes for lights during fogs. I am not aware of any series of experiments on the distances at which sounds of various kinds can be heard. In a question on which so much property and so many lives depend, it is surely important to be well informed. The only resource is experiment. It may be remarked that the low notes of the gong might be confounded with those of the roll of waves breaking on the shore, while the shrill whistle of the steam-engine will find a rival in the wind whistling through the rigging. The trumpet and the new and still more powerful instrument at the recent exposition ought also to be compared.

"Again, although some of these may be heard at greater distances in the open air, some may be more easily adapted to have their sound concentrated and directed, when placed in the focus of a parabolic mirror, or, perhaps, at the end of a long tube. Sound is

transmitted to considerable distances through water, and it has been suggested that this might be used in case of fogs. But it seems probable that sound would be much interrupted in its progress from the constant motion of the waves; and if it were transmitted at a considerable depth, it might be difficult for a vessel to send down an apparatus to render it sensible. Experiments should be made on the distance at which sounds can be heard under water in various circumstances of its motion. If, during storms, the surface only is agitated, it might be possible to transmit sounds in the still water near the bottom to considerable distances. Thus channels might be traversed by telegraphic communications with a less costly apparatus than that of the electric wire. It ought also to be ascertained whether the forms of the instruments struck would enable them to project their sounds in particular directions. Gongs, bells, and the firing of cannon under water, are among the sounds to be tried.

"Whatever may be the sound audible at the greatest distance, it will be necessary to ascertain what are the best means of producing it in greatest intensity—whether by one large instrument, or by many small ones. It seems probable that some combination of discordant sounds may be most effective, because it seems to be a law of our nature that contrasts produce stronger impressions than uniformity. There is one form of sound the most disagreeable with which we are acquainted; it is said 'to set the teeth on edge.' What is the cause of this, and does that highly obnoxious sound penetrate further than others? If it penetrate as far as others, it will certainly be the earliest to be noticed.

"*Lights on Buoys.*—The time is probably not remote when lights will be placed on floating buoys for the purpose of pointing out isolated dangers—as sunken rocks, shoals, etc., on which light-houses can not be placed, or where the great expense may prevent them from being built. They may also be useful to indicate the channels leading to some few ports of very great resort in order to render the approach of vessels possible during the night. The first difficulty in placing lights on buoys arises from the necessity of trimming the lamps, and of supplying them with fresh oil. Galvanic processes seem to present a similar difficulty. The chemical discoveries of recent times, however, offer some hope of removing it. By the destructive distillation of peat, of coal, and of shale, as well as by other methods, a variety of combinations of hydrogen and carbon have been obtained. Some of these only remain liquid under a pressure of two or three atmospheres. They possess considerable illuminating power; and by confining them in a close vessel, and allowing a very small aperture for their escape in the state of gas, a jet of flame may be produced, of uniform magnitude, and without the use of a wick, until the last drop of fluid has evaporated. If such a fluid could be produced at a moderate price, a quantity might be inclosed within the buoy, sufficient to last several weeks, if not months.

"Such a light would burn without the necessity of trimming, but it would require mechanism to light it each evening, and to put it out each morning. Such mechanism already exists in many of our public clocks. If it is thought desirable, too, that it should occult, so as to indicate its number, the plan already described might be applied. Thus the buoy would contain two pieces of mechanism. The only remaining difficulty would be the necessity of visiting the light frequently in order to wind up the two instruments. This might probably be removed by having within the buoy a heavy pendulum, or perhaps two such, swinging at right angles to each other. If the perpendicular motion of the buoy could be secured, then the winding up pendulums must be maintained horizontally by means of a powerful spring. These, by the action of the waves, would be continually winding up the springs

which drive the mechanism. This might be so arranged that it would never over-wind them. Spirits of turpentine, benzole, and several other compounds, assume a gaseous state at very low temperatures. If the end of a tolerably thick rod of metal is heated by the flame of the lamp, and the other end conducts the heat to the bottom of the fluid, it is sufficient to produce a continuous stream of gas to supply the burner until the last drop of the fluid is exhausted. Lamps constructed on this principle have, under various names, been in use for several years. If the fluid were sufficiently cheap, one of these movements might be dispensed with, by allowing the light to burn constantly during the day as well as the night. New forms would be required for such buoys. Probably a columnar form, weighted at the bottom, might give a steadier light amid the fluctuations caused by the waves. These buoys should be attached to their moorings by rings fixed at the centre of resistance.

"*Of the Mechanism necessary for Occulting Lights.*—The period of time occupied by any occulting light in making a signal is so short that great accuracy in the wheel-work is not necessary. In light-houses the moving power may be a heavy weight driving a train of wheels. This must terminate in a governor, which presses by springs against the inner side of a hollow cylinder. When the length of the time necessary to indicate the number of the light-house is known, the governor must be so adjusted that some one axis shall revolve in the given time. A cam-wheel must be fixed on this axis, having its cams and blank spaces so arranged as to lift up the tail of a lever carrying the occultating cylinder at the proper intervals of time. Each tooth of the cam-wheel will cause an occultation of the lamp by the cylinder, which is instantly drawn back by a spring. It is obvious that an axis might be used which moves round in the course of two, three, or more cycles. In this case, the same system of cams would be repeated an equal number of times in the circumference of the cam-wheel. This plan is sufficient for light-houses which are not intended for signal stations also. When signals are to be used, it is better to have a single cam on an axis which revolves once in the time which elapses from the end of one occultation to the end of the next. The effect of this cam will be, by acting upon a forked lever, to lift up the occulting cylinder. If nothing retain it in that position, the action of the spring on the lever will cause it to descend, and the cylinder, acted on by gravity, will instantly follow. But if an arm is interposed which retains the cylinder, then the forked lever alone will be pulled back by its spring, and the occulting cylinder will remain suspended until the next turn of the cam-wheel. The suspending arm which was interposed must itself be governed by a cam-wheel, expressing the number of the light-house.

"When a signal is to be made, an adjustable cam-wheel is to be set to the proposed signal, and is to be fixed upon the axis carrying the constant number of the light-house. When the proper time arrives for making the signal, it is only necessary to shift the axis, so that the adjustable cam-wheel shall be moved into the place occupied by the fixed cam-wheel. The signal will now be made and repeated as often as required, after which, the original position of the constant cam-wheel must be restored. It is clear that any number of adjusting cam-wheels might be prepared for signals, and put upon the axis at once, so that a series of different signals might be made in a very short time. Lights to mark the depth of water must have a heavy float connected with them, which, at every foot of its rise or fall, must alter the number of occultations made by the colored light. It must, also, at the turn of the tide, change the color of the light. It is sufficient for the present purpose to observe that the mechanism similar to that by which a clock strikes different hours, might be employed for

this purpose. The well in which the float is placed ought to be open to the tide by several small apertures; this would render the rise or fall of the float more uniform. Telescopes are used for observing light-houses. They have a small magnifying power, but a large aper-

ture. It is important that they should be as short as possible, for taking in a given visual angle. Possibly, those constructed with a lens of rock-crystal might be employed with advantage, but upon this subject, also, experiment must be made.

* This list of 34 towers comprises those of the greatest elevation of the entire number of stations (296) on the coasts of the United States. Of the remaining towers (say 261), the majority have no greater average elevation than 50 to 65 feet, while there are many having less than 30 to 40 feet. The European lists, on the contrary, comprise nearly all the sea-coast lights.

SCOTCH LIGHTS.

Of the 24 northern lights in 1884, the following were fitted as below:

Light-house System of the United States 1856-57.—The recommendations suggested in the Report of 1851, have been generally carried into effect. At the end of the year 1856, there were in operation, or nearly finished, in the United States, 509 light-houses, light-boats, etc. The following extracts from the Light-house Board Report, under date November 1, 1856, will show some of the important changes that have recently taken place:

"The general condition of the aids to navigation, at the date of the last report from this office, was such as to leave but little to be done toward completing the systematic plan of improvements of authorized aids to navigation along the coasts beyond the general routine duties of renovating and repairing existing structures, and of providing those aids for which appropriations had been then recently made. The system of buoyage and beaconage had been carried out as perfectly, and to as great an extent as the means provided for that object would admit; and it is believed that but few localities are known to exist requiring additional aids of that kind. Renovations and improvements of light-houses and light-vessels, in addition to the ordinary necessary repairs, have been made as extensively during the past year as the means provided and the period of time for doing so would permit. A large number of lens illuminating apparatus has been substituted for the old reflectors and fountain lamps, to the great benefit and economy of the service. Changes are still being made as rapidly as the lens apparatus is available, having in each case due regard to the condition of the old apparatus in the light-houses requiring renovation. New and improved illuminating apparatus has been placed in, or is in course of preparation for, such of the light-vessels as had not been refitted at the date of the last report. All

the aids to navigation, for which special appropriations have been made, have either been completed or commenced, except those condemned as being unnecessary by the proper authority, or those to the sites of which perfect titles have not been obtained. The late period of the year at which Congress made appropriations at its last regular session for new aids to navigation, rendered it impracticable to commence many of the works this season; but preliminary steps have been taken for commencing those at the north early next spring, and those at the south will be commenced and prosecuted as far as possible during the ensuing winter.

"The frequent inspections of the lights by inspectors and others, the instruction which the keepers have derived from them, and their acquirement of a better knowledge of their duties, as laid down in the printed instructions and directions, have resulted in a gradual but very perceptible improvement in the character, appearance, and reliability of lights along the entire coast. Notwithstanding the extraordinary severity of the past winter, and the consequent injury done to the buoys and light-vessels by the masses of floating ice on the coast from the capes of Virginia to the eastern boundary, it is believed but little serious inconvenience resulted to navigation on account of the temporary absence at times of these aids from their proper stations. The buoys which were driven from their stations were promptly replaced, by means of the buoy vessels, from the duplicates kept on hand at different points along the coast, and no efforts were spared to have the light-vessels repaired and towed by steamers to their stations with the least practicable delay. Since the light-vessels have been provided with service and spare moorings of the best description, but few of them have broken adrift from, or left even the most exposed positions. The supplies have been distributed to the lights on the Atlantic, gulf, and lake coasts, by three supply vessels employed, with as much regularity, and as satisfactorily as could be expected in a service, the successful performance of which depends so much upon the weather. The great diminution in the quantity of oil required to be delivered at the lights fitted with lens apparatus, will be the means, as the new apparatus is substituted for reflectors, of facilitating the operations of making deliveries; and more frequent and regular visits will be made without increasing the number or expense of the supply-vessels.

"The officer in charge of the light-house service on the Pacific coast was instructed to lose no time in commencing the erection of the light-house at Umpqua, in Oregon Territory, and it is expected, from the urgent instructions from this office, and the zeal and energy of the officer in charge, that it will be built as soon as the necessary materials can be collected at the site. The illuminating apparatus and lantern for that light reached the Pacific coast in July last. Instructions were also given to commence the building of the light at New Dungeness, in Washington Territory, and to take the necessary steps for commencing the one at Cape Flattery and at Blunt's Island with the least practicable delay. The Indian hostilities in Washington and Oregon Territories, and the difficulties attending, necessarily, operations at such distant and sparsely populated localities, will doubtless account for any seeming delay in the execution of these works. In the last report from this Board attention was invited to the low rate of compensation allowed to light-keepers under the existing law. By the fourth section of the act making appropriations for light-houses, etc., approved May 23, 1828, the Secretary of the Treasury is authorized and empowered to regulate and fix the salaries of the respective keepers of light-houses in such a manner as he shall deem just and proper, 'provided the whole sum allowed shall not exceed an average of \$400 to each keeper.' The Board would again respectfully renew its recommendation of last year, that a reasonable increase be made

to the present average rate of compensation to light-keepers, as the best means of insuring efficiency and true economy in the care and management of the light-houses on our extended, dangerous, and, in many portions, sparsely populated and inhospitable coast. The present average rate of compensation to the keepers of light-houses on the Pacific coast, as established by the appropriation bills, is \$800 per annum; but the difficulties which have been met with in obtaining the services of competent and reliable keepers for some of the lights at isolated, though important points, on that coast, and the frequent resignations of keepers after a short trial of the duties, lead to the opinion that the main cause of dissatisfaction with the service arises from insufficiency of the compensation in the present state of that part of the country."

The annual report of the United States Light-house Board, under date of November, 1857, recapitulates the progress of the work, viz.:

The systematic plan for an economical administration of the light-house establishment service, and for improving and perfecting those aids to navigation which had been authorized by the different acts of Congress subsequent to the passage of the law of August 7, 1789, which enacted "that all expenses which shall accrue from and after the fifteenth day of August, one thousand seven hundred and eighty-nine, in the necessary support, maintenance, and repairs of light-houses, beacons, buoys, and public piers, erected, placed, or sunk, before the passage of this act, at the entrance of or within any bay, inlet, harbor, or port of the United States, for rendering the navigation thereof easy and safe, shall be defrayed out of the treasury of the United States," was commenced by this board under the direction, orders, and instructions of the honorable Secretary of the Treasury on the 9th of October, 1852, under the authority of the act of Congress of 31st August, 1852.

At that time there were 325 light-houses and lighted beacons, and 38 light-vessels, making an aggregate of 343 light stations and 371 lights of all orders or classes, distributed in the waters and along the coasts of the Atlantic, Gulf, and northwestern lakes. A few buoys and beacons were placed along the coast and in the bays and harbors of the most prominent sea-ports, without system or plan, and often misleading instead of guiding the mariner. There were no lights or other aids to navigation at that time in the harbors or bays on the Pacific coast of the United States. There are now on the Atlantic, Gulf, Lake, and Pacific coasts of the United States, 548 light-house and light-vessel stations, with an aggregate of 602 lights; also 31 lights remaining either to be condemned according to law, or to be built in obedience to the directions of Congress, as soon as valid titles to the sites are obtained; making, after allowing for all probable condemnations and the discontinuance of such as time has shown to be wholly unnecessary for the general interests of commerce and navigation, an aggregate of 579 light stations, including light-vessels, and 627 lights. The buoyage and beaconage, at that time almost entirely neglected, is now, it is believed, unsurpassed in systematic arrangement, in reliability, and in economy of administration. The number of buoys and beacons may be put down, in round numbers, at not less than 4500 or 5000, with duplicates (and at most places along the coast spare buoys) to replace those to be taken up each spring and autumn for cleaning and painting, and to replace those removed or destroyed by ice or by storms, and by being run into and sunk by steamers and other vessels. The entrances to the principal harbors, and ship-channels leading to them, are marked by large nun and can buoys, made chiefly of iron, which have been introduced within the last four years. The previous reports from this office during the last five years have informed the department and Congress of the extremely dilapidated condition

of the towers and buildings, of the inferior quality of the illuminating apparatus, and of the wasteful expenditures of oil, wicks, chimneys, and other necessary supplies, owing to the large number of lamps employed at the different light-stations, many of which, with proper illuminating apparatus, would have incurred less than one-tenth the cost for far more brilliant and better adapted lights. The light-vessels were found to be in a state of inefficiency, some of them absent from their stations for months at a time, without substitutes to occupy their places, with an inferior description of lamps, consuming large quantities of oil without producing sufficiently powerful lights to be seen at the required distances, or an adequate return for the expense incurred.

It will appear that at the time the Light-house Board was organized under the act of August 31, 1852, there were but five lights at four stations fitted with apparatus that had long before been shown incontestably to be in point of economical effect in no case less than 4 to 1, as compared with the catadioptric or reflecting light system, and in point of power and brilliancy the proportion in percentage was 83 to 16—that is, the consumption of oil would not exceed one-fourth in the new system of what was actually required in the old, and at the same time the new system producing for the benefit of the navigator more than five times as much light with this one-fourth part of the oil required for the argand lamps and parabolic reflectors. But even this comparison is too favorable to the state of the light-house establishment as it existed up to 1853, inasmuch as the apparatus was not, of its kind, the best that could be made, and also from the fact that the great majority of lights (those in the bays, sounds, rivers, and harbors) were fitted with a much larger number of lamps than was necessary, even under that system, attributable, however, to the great inferiority of the apparatus, which, it would seem, it was attempted to remedy by increasing the number of lamps at each station. The estimates for 1853 gave 3093 lamps for the 331 light stations. Estimating at an average of 10 lamps for each new light authorized or built since that time, the number of lamps to be fed with oil, to be supplied with wicks and chimneys, and in proportion to be supplied with the various articles of expensive cleaning materials, would, under the old system, have amounted to the large number of 5560 lamps, requiring an annual supply of not less than 222,400 gallons of oil, computing the consumption at 40 gallons per lamp, which is the minimum rate. The cost of oil has been as high as \$2 per gallon at the warehouses of the manufacturer, and has been estimated for the year 1858-'59 at the rate of \$1 60 per gallon.

The lights at Southwest Pass and South Pass of the Mississippi should be discontinued after the completion of the Southwest Pass screw-pile tower, which was authorized August 4, 1854, and for which \$45,000 was appropriated, leaving about \$70,000 to be appropriated for its entire completion before commencing the work.

The annual appropriations for renovations, repairs, etc., of light-houses, within the period referred to, have been employed to the best possible advantage in rebuilding such light-houses as were in imminent danger of falling to pieces, and, where special appropriations had not been made for rebuilding them, in providing the necessary improved and economical apparatus, fitting the lanterns and towers for receiving them, and in placing them; and with those means alone the whole of the light-houses existing in January, 1853, have been provided with new apparatus of the most approved kind, which combines the greatest advantages yet discovered in the science of light-house illumination—of power, durability, and economy.—See *Light-house Reports*, 1853 to 1858; also *Coast Survey Reports*.

Lima, the capital of Peru, on the west coast of South America, lat. $12^{\circ} 2' 42''$ S., long. $77^{\circ} 7' 15''$ W. Population variously estimated; but may probably amount to from 50,000 to 60,000. In 1524, Pizarro, marching through Peru, was struck with the beauty of the valley of Rimac, and there he founded a city, and gave it the name of *Ciudad de los Reyes*, or City of the Kings. This Spanish name it retains in all legal deeds, but it is better known as Lima. Awful earthquakes occurred here, since solemnly commemorated by annual festivals, A.D., 1586, 1630, 1687, and October 28, 1746. In the last it was almost totally destroyed, as well as Callao.

Callao, the port of Lima, is about six miles west from the latter. The harbor lies to the north of a projecting point of land, in the angle formed by the small uninhabited island of San Lorenzo. Previously to the emancipation of Peru, and the other *ci-devant* Spanish provinces in the New World, Lima was the grand *entrepôt* for the trade of all the west coast of South America; but a considerable portion of the foreign trade of Peru is now carried on through Buenos Ayres, and the former is also in the habit of importing European goods at second hand from Valparaiso and other ports in Chili. The exports from Lima consist principally of silver, which is by far the most important article, copper ore, bark, soap, Alpaca wool, etc. Guano is found in large quantities on some parts of the coast of Peru, but is principally imported from some small islands, opposite to Pisco, where it is found in vast quantities. The great value of guano as a manure is now generally recognized, and it is hardly of less importance as an article of commerce, no fewer than 80,000 tons having been imported in 1847. It was partly, however, brought from Chili and other ports, as well as from Peru; but that from the latter is decidedly the best. The imports consist principally of cotton stuffs, linens, woolens, and hardware, principally from England; silks, brandy, wine, and quicksilver from Spain and France; stock-fish and flour from the United States, indigo from Mexico, Paraguay herb from Paraguay, spices, dye-stuffs, etc. Timber for the construction of ships and houses is brought from Guayaquil. For moneys, weights, and measures, see PERU.

Lime (Ger. *Kalk*; Fr. *Chaux*; It. *Calcina*, *Calce*; Sp. *Cal*; Rus. *Iwest*), an earthy substance of a white color, moderately hard, but which is easily reduced to powder, either by sprinkling it with water or by trituration. It has a hot burning taste, and in some measure corrodes and destroys the texture of those animal bodies to which it is applied. Specific gravity, 2.3. Calcium, the metallic basis of lime, was discovered by Sir H. Davy. There are few parts of the world in which lime does not exist. It is found purest in limestone, marble, and chalk. None of these substances is, however, strictly speaking, lime; but they are all easily converted into it by a well-known process; that is, by placing them in kilns or furnaces constructed for the purpose, and keeping them for some time in a white heat—a process called the burning of lime.—*Thomson's Chemistry*. The use of lime as mortar in building, has prevailed from the earliest antiquity, and is nearly universal. It is also very extensively used in this country, and in an inferior degree in some parts of the Continent and of North America, as a manure to fertilize land. But it is a curious fact that the use of lime as a manure is entirely a European practice; and that its employment in that way has never been so much as dreamed of in any part of Asia or Africa. Lime is of much importance in the arts, as a flux in the smelting of metals, in the shape of chlorate in bleaching, in tanning, etc. Lime and limestones may be carried and landed coastwise without any customs document whatever. Its consumption in this country is very great.

Lime (Fr. *Citronier*; Ger. *Citronen*; Hind. *Neem-*

bo), a species of lemon (*Citrus medica*, var. δ C.), which grows in abundance in most of the West India islands, and is also to be met with in some parts of France, in Spain, Portugal, and throughout India, etc. The lime is smaller than the lemon, its rind is usually thinner, and its color, when the fruit arrives at a perfect state of maturity, is a fine bright yellow. It is uncommonly juicy, and its flavor is esteemed superior to that of the lemon; it is, besides, more acid than the latter, and to a certain degree acrid.

Limerick, the principal city of west Ireland, and a parliamentary and municipal borough, river port, and county of itself, and capital county. Limerick, on an island in the Shannon, and on both banks of that river, being partly in county Clare, 50 miles from the Atlantic, and 25 miles N.N.W. Tipperary, with which town it communicates by railroad. Lat. $52^{\circ} 40'$ N., long. $8^{\circ} 35'$ W. Area of border, 70,000 acres. Population 1851, 55,268. Inhabited houses, 5,566. Population of town, 53,274. There are numerous flour mills, but manufactories are very limited; those of lace and fish-hooks are the principal; the trade, consisting of imports of British manufactures, coal, turf, continental and colonial produce, and of exports of corn, meal, butter, beef, pork, is great, and still increasing. Ships of 500 tons unload at the quays, and those of 1000 tons approach within 5 miles of the city, which by steamers on the upper Shannon and by canals, has also a water communication with Dublin.

Lime-tree. Lime-tree, Black Lime-tree, Smooth-leaved Lime-tree, Bass-wood. The *Tilia Americana*, like the European linden, is regarded as one of the finest of forest trees, and when cultivated, proves highly ornamental. In our native woods it often rises more than 80 feet in height, and frequently upward of four feet in diameter; and there is little doubt but, if cultivated, and judiciously treated, it would reach a size little inferior, if not equal, to the European species. Its body is straight, uniform, and surmounted with an ample and tufted summit. In winter it is readily recognized by the robust appearance of the trunk and branches, and by the dark-brown color of the bark on the shoots.

Geography and History.—The *Tilia Americana* is found in Canada and the northern parts of the United States. It becomes less abundant toward the south, except on the Alleghanies, where it is found quite at their termination in Georgia. It is profusely multiplied on the borders of Lakes Erie, Ontario, and in Maine, New Hampshire, and Vermont. It was cultivated in England by Miller, in 1752, but has not been very extensively distributed. The *Tilia Americana laxiflora* is said to abound from Maryland to Georgia, near the sea-coast. It was introduced into Britain in 1820, and is but sparingly cultivated in that country. The *Tilia Americana pubescens* belongs to the southern parts of the United States; Florida, Kentucky, and Texas. It is said to be the only variety found in the maritime parts of Carolina, Georgia, and Florida. Seeds of this tree were carried from this country to England by Mark Catesby, in 1726; but it does not appear to have been much cultivated. The *Tilia Americana alba* is not met with east of the River Delaware, but it is found in Pennsylvania, Maryland, Delaware, Virginia, Ohio, Kentucky, and Georgia. It is said, also, to grow on the River Santee, in South Carolina, and on the Mississippi. It is remarkable, that, although this variety was known in France in 1755, it should not have been introduced into England till 1811.

Properties and Uses.—The wood of the American lime-tree, when dry, weighs 35 pounds to a cubic foot. It is very white, when green, but becomes of a light-brown hue, when seasoned. It is soft, easily worked, and is often sawed into boards, which do not warp, like those formed of resinous trees. In the northern parts of the United States, and in the British prov-

inces, where the tulip-tree does not abound, it is used for the panels of carriage bodies, and the seats of chairs. In Kentucky and the western States, the wood of the white lime is often substituted for that of the white pine. In various parts of the country, it is turned into domestic utensils of various kinds; and is also carved into images for the heads of vessels, and other ornamental work. The young trees are sometimes cut, and employed as rails for rural fences; but they are not durable when thus exposed. The wood is almost useless as fuel, when green, being too full of sap, and of but little value when dry. The cellular integument of the bark is separated from the epidermis, and, after being macerated in water, is formed into ropes, after the manner of making them in Europe, of the other species. The bark was also employed by the Lenni Lenape Indians for making lines and ropes, as well as for covering their habitations. The outer bark of the *Tilia Americana* is rough and stringy, and the inner portion viscid and sweet. The twigs and buds are very glutinous when chewed, and afford considerable nutriment. In severe winters, when fodder is scarce, it is common for the farmers of the British American provinces, as well as those of Maine, New Hampshire, and Vermont, to drive their cattle into the woods in the morning, and fell a bass-wood, or other tree, on which they eagerly browse during the day.

The wood of the European lime-tree, or linden-tree, as compared with that of the oak, the ash, and other timber trees, holds but an inferior rank, and is only used in such works as are not to be exposed to the alternations of moisture and dryness. It is of a pale yellow, or white, close-grained, soft, light, and smooth; and, when seasoned, it is not liable to be attacked by insects. It is used by piano-forte-makers for sounding-boards, and by cabinet-makers for a variety of purposes, as it does not warp under atmospheric changes. It is turned into domestic utensils of various kinds, carved into toys, and turned into small boxes for apothecaries. The most elegant use to which it is applied, is for carving, for which it is superior to every other wood. Many of the fine carvings in Windsor Castle, Trinity College Library, at Cambridge, and in the Duke of Devonshire's mansion, at Chatworth, are of this wood. It is said to make excellent charcoal for gunpowder, even better than alder, and nearly as good as hazel, or willow. Baskets and cradles were formerly made from the twigs; and shoe-makers and glovers are said to prefer planks of lime-tree for cutting the finer kinds of leather upon. The leaves of this tree are collected in Sweden, Norway, Carniola, and Switzerland, for feeding cattle; though, in Sweden, Linnaeus says, they communicate a bad flavor to the milk of cows. One of the most important uses of the lime-tree, in the north of Europe, is that of supplying material for making ropes and mats; the latter of which enter extensively into European commerce. The Russian peasants weave the bark of the young shoots for the upper parts of their shoes, the bark of the trunks or large branches serving for the soles; and they also make of it, tied together with strips of the inner bark, baskets and boxes for domestic purposes. The outer bark of old trees also supplies them, like that of the birch, with tiles for covering their cottages. Ropes are still made of the bark of this tree in Cornwall, and in some parts of Devonshire. The manufacture of mats from the inner bark, however, is now chiefly confined to Russia, and to some parts of Sweden. Trees from six to twelve inches in diameter are selected at the beginning of summer, when, from the expansion produced from the ascending sap, the bark parts freely from the wood. The bark is then stripped from them in lengths of six to eight feet, and is afterward steeped in water till it separates freely in layers. It is then taken out, and divided into ribbons or strands, and hung up in the

shade, generally in the forest where it grows, and, in the course of the summer, is manufactured into mats, so much in use by gardeners and upholsterers, and for covering packages generally. The fishermen of Sweden make nets for catching fish, of the fibres of the inner bark, separated by maceration, so as to form a kind of flax or hemp; and the shepherds of Carniola weave a coarse cloth of it, which serves for their ordinary clothing. The sap of the lime-tree, drawn off in spring, and evaporated, affords a considerable quantity of sugar. The honey produced from the flowers is considered superior to all other kinds for its delicacy, selling for three or four times the price of common honey; and it is used in the preparation of medicine, and for making particular *liqueurs*, more especially *rosoglia*. This lime-tree honey is only produced at the little town of Kowno, on the River Niemen, in Lithuania, which is surrounded by an extensive forest of lime-trees, and where the management of the honey-bee occupies the principal attention of the inhabitants. The Jews of Poland produce a close imitation of this honey, by bleaching the common kind in the open air, during frosty weather. The fruit of the lime-tree had long been thought of little use, till M. Missa, of Paris, by triturating it, mixed with some of its flowers, succeeded in procuring a butter, perfectly resembling chocolate, both in taste and consistency; but, unfortunately, it was found that the lime-tree chocolate would not keep. It has been suggested whether some of the American varieties of *tilia* would not prove successful in this particular. In England, there are many ancient lime-trees, planted in towns, because, in olden times, their odor was considered as purifying to the air, and to be good against epilepsy.—BROWNE'S *Trees of America*.

Line, in Geometry, a quantity extended in length only without breadth or thickness: It is formed by the flux or motion of a point. *Line*, in the art of war, is understood as the disposition of an army ranged in order of battle with the front extended out so that it may be flanked. *Line of battle* is also understood as the disposition of a fleet in the day of engagement; on which occasion the vessels are usually drawn up as much as possible in a straight line, as well to gain and keep the advantage of the wind as to run the same board. *Horizontal line*, in Geography, and Astronomy, a line drawn parallel to the horizon of any part of the earth. *Equinoctial line* in Geography is a great circle on the earth's surface exactly at the distance of 90° from each of the poles, and of consequence bisecting the earth in that part. From this imaginary line the degrees of longitude and latitude are reckoned. In Astronomy, the equinoctial line is that circle which the sun seems to describe round the earth on the days of the equinox in March and September. *Meridian line*, is an imaginary circle drawn through the two poles of the earth and any part of its surface.

Linen (Ger. *Linnen*, *Leinwand*; Du. *Lynwaat*; Fr. *Toile*; It. *Tela*, *Panno*, *lino*; Sp. *Lienza*, *Tela de lino*; Rus. *Polotno*), a species of cloth made of thread of flax or hemp. The linen manufacture has been prosecuted in England for a very long period; but though its progress has been considerable, particularly of late years, it has not been so great as might have been anticipated. This is partly, perhaps, to be ascribed to the efforts that have been made to bolster up and encourage the manufacture in Ireland and Scotland, and partly to the rapid growth of the cotton manufacture—fabrics of cotton having to a considerable extent supplanted those of linen.

Linen is a fabric of very remote antiquity. Pharaoh arrayed Joseph in vestures of fine linen.—*Gen.*, xli. 42. This article was first manufactured in England by Flemish weavers, under the protection of Henry III. 1253. Before this period woollen shirts were generally worn. A company of linen weavers established itself in London, 1668, and the art of stain-

ing linen became known in 1579. A colony of Scots in the reign of James I., and other Presbyterians who fled from persecution in that country in the succeeding inglorious reigns, planted themselves in the north-east part of Ireland and there established the linen manufacture. It was liberally encouraged by the lord deputy Wentworth, in 1634. Hemp, flax, linen, thread, and yarn, from Ireland, were permitted to be exported duty free, 1696. This law gave rise to the subsequently improved state of the manufacture there. The Irish Linen Board was established in 1711; the Linen-hall, Dublin, was opened, 1728; the Board was abolished in 1828. Dunfermline in Fifehire, Dundee in Angusshire, and Barnsley in Yorkshire, are, in Great Britain, chief seats of the linen manufacture.

Spinning by the hand is now nearly unknown in Ireland, and the manufacture has disappeared from several parts of the country, where it had been largely introduced, leaving those who were partially dependent on it for subsistence, in a very depressed state. On the whole, however, there can be no doubt that the introduction of the factory system will be, in the end, most advantageous. Belfast has long been the great seat of the manufacture in Ireland, and there it is carried on in large factories furnished with the best machinery, and conducted on the most approved principle. In 1841, there were in the town and its immediate vicinity, 25 steam mills for spinning linen yarn, one of which employed 800 hands. In 1835, the exports of linen goods from Belfast, amounted to 53,881,000 yards of the value of £2,694,000. According to the official returns, there were in Ireland, in 1838, 40 flax-mills employing in all, 9,017 hands. The total average export of linens from Ireland during the 3 years ending with 1825, was 51,947,413 yards, of which 49,031,073 came to this country; the exports to all other parts being only 2,916,340. Since 1825, the trade between Ireland and Great Britain has been placed on the footing of a coasting trade; and linens being exported and imported without any specific entry at the custom-house, no account is kept of their quantity and value.

Scotch Linen.—In 1727, a Board of Trustees was established in Scotland for the superintendence and improvement of the linen manufacture. It is not easy to suppose that the institution of this Board could of itself have been of any material service; but considerable bounties and premiums being at the same time given on the production and exportation of linen, the manufacture went on increasing. Still, however, it did not increase so fast as cotton and some others, which have not received any adventitious support, until machinery began to be extensively employed in the manufacture; so that it is very doubtful whether the influence of the bounty has been so great as it would at first sight appear to have been. The regulations as to the manufacture, after having been long objected to by those concerned, were abolished in 1822; and the bounties have now ceased.

Dundee is the grand seat of the Scotch linen manufacture; and its progress there during the last few years has been so extraordinary, that the following details in respect to it may not be unacceptable. The manufacture appears to have been introduced into Dundee some time toward the beginning of last century; but, for a lengthened period, its progress was comparatively slow. In 1745 only 74 tons of flax were imported, without any hemp; the shipments of linen cloth during the same year being estimated at about 1,000,000 yards, no mention being made either of sail-cloth or bagging. In 1791, the imports of flax amounted to 2,444 tons, and those of hemp to 299 tons; the exports that year being 7,842,000 yards linen, 280,000 yards sail-cloth, and 65,000 yards bagging. From this period the trade began to extend itself gradually, though not rapidly. Previously to the peace of 1815, no great quantity of machinery was em-

ployed in spinning; but about this period, in consequence, partly and principally, of the improvement of machinery, and its extensive introduction into the manufacture, and partly of the greater regularity with which supplies of the raw material were obtained from the Northern powers, the trade began rapidly to increase. Its progress has, indeed, been quite astonishing; the imports of flax and hemp having increased from about 3000 tons in 1814 to 15,000 tons in 1830, and 40,000 tons in 1845, of which at least 30,000 tons were spun by the mills in the town, the rest being spun in the vicinity. The value of the exports of manufactured goods and yarn, from Dundee, amounts at present (1847) to from £1,600,000 to £1,700,000, a year.

AN ACCOUNT OF THE QUANTITIES OF THE DIFFERENT VARIETIES OF LINEN GOODS EXPORTED FROM DUNDEE DURING EACH OF THE FOUR YEARS ENDING WITH 1845.

It is not easy to give any satisfactory explanation of the remarkable progress of the linen manufacture at Dundee. Something must be ascribed to the convenient situation of the port for obtaining supplies of the raw material; and more perhaps to the manufacture having been long established in the towns and villages of Strathmore, the Carse of Gowrie, and the northern parts of Fife, of which Dundee is the emporium. But these circumstances do not seem adequate to explain the superiority to which she has recently attained in this department; and however unphilosophical it may seem, we do not really know that we can ascribe it to any thing else than a concurrence of fortunate accidents. Nothing, in fact, is so difficult to explain as the superiority to which certain towns frequently attain in particular departments of industry, without apparently possessing any peculiar facilities for carrying them on. But from whatever causes their pre-eminence may arise in the first instance, it is very difficult, when once they have attained it, for others to come into competition with them. They have on their side established connections, workmen of superior skill and dexterity in manipulation, improved machinery, &c. Recently indeed the advantages in favor of old establishments have been, to a considerable extent, neutralized by the prevalence of combinations among their workmen; but it is to be hoped that means may be devised for obviating this formidable evil.

Value of Manufacture.—There are no means by which to form an accurate estimate of the entire value of the linen manufacture of Great Britain and Ireland. Dr. Colquhoun estimates it at £15,000,000; but there can not be the shadow of a doubt that this estimate was, at the time, absurdly exaggerated. In the last edition of this work we estimated the annual value of the manufacture at £7,500,000. But it has increased very rapidly in the interval, principally through the great extension of the exports of France, and its value is at present (1847) certainly not under, if it do not exceed £10,000,000 or £12,000,000. But taking it at the former amount, and setting aside a third part of this sum for the value of the raw material, and another third for profits, wages of superintendence, wear and tear of capital, coal, &c., we have £3,333,000 to be divided as wages among those employed in the manufacture. And supposing each individual to earn on an average £24 a year, the total number employed would be about 133,000. It may be thought, perhaps, that £24 is too low an estimate for wages; and such, no

doubt, would be the case were not Ireland taken into the average. But as many persons are there employed in the manufacture at very low wages, we believe that £24 is not very far from the mean rate.

The rapid increase in the exports of linen goods and yarn, especially the latter, to France (see for an account of this increase the article HAVRE), though latterly they have declined, is wholly a consequence of their comparative cheapness in this country, occasioned by our superior and cheaper machinery. And if the French really wish to rival us in this department of industry, they should endeavor, by reducing or repealing the oppressive duties on iron and machinery imported into France (which would, of course, proportionally reduce the cost of the spinning-mills and power-loom factories), to place their manufacturers and spinners on something like the same footing as ours. In this way they might, perhaps, have some chance of rivaling us; but the attempts that have recently been made to bolster up the manufacture by means of duties, must necessarily fail, and will have no effect but to perpetuate exploded practices, and to promote the trade of smuggling. The British exports of linen goods are also increasing to most other countries, as well as to France; and we are gaining on the Germans in most markets that are equally accessible to both. Hence the decrease of late years in the export of linens from Hamburg. The improvement in the manufacture of damasks and table-linen generally, which is principally carried on in Dunfermline and Kirkcaldy, has been quite as striking as in the other departments of the trade, especially since the introduction of the Jacquard mounting. In fact, table-linen is now shipped from this country for Germany; so that the duty of 10 per cent. on the importation of German damasks and such like fabrics might be reduced or repealed without the measure having any injurious influence over the manufacturer.

TABULAR VIEW OF THE FOREIGN EXPORTS OF LINEN GOODS FROM GREAT BRITAIN FOR EACH YEAR FROM 1821 TO 1852, BOTH INCLUSIVE.

Years.	Value.	Years.	Value.	Years.	Value.
1821....	21,981,465	1832....	21,655,478	1843....	23,702,052

San Francisco.....	87,295	2,466
Total.....	\$9,549,600	\$4,921	\$1,334,942

Consumption of Foreign Linens.—According to the returns of the imports and entries of foreign linens

for the four years ending with 1844, the consumption of foreign linens in England is quite inconsiderable; the real or declared value of those entered for home consumption in 1844 could hardly amount to £40,000.

Until recently, this manufacture has been neglected in the United States. Lately, however, mills have been erected to test the profitability of linen manufacture. In Fall River, Mass., new mills have been built, but not long enough in operation to give any statistics.

Linseed. The manufacture of linseed oil has greatly increased within a few years, encouraging the importation of seed from Calcutta and other places. The imports of linseed into Boston from Calcutta for the year 1856 were 1,887,944 bushels, valued at \$1,841,719. The imports of linseed into the United States for the year 1856, amounted to 1,696,294 bushels, of which 1,691,875 bushels were from the East Indies.

By the official returns it appears that the imports into the United Kingdoms in 1856 amounted to 1,180,179 quarters of linseed, and to 264,919 of rape-seed, showing a very great increase in both cases as compared with the previous annual arrivals. Annexed are the official returns for the last 16 years, during which the consumption of the manufactured articles has made rapid strides.

Years.	Linseed.	Rape-seed.

Liquorice (Ger. *Suessholz*; Fr. *Régliasse*, *Racine douce*; It. *Regolizia*, *Logorizia*, *Liquirizia*; Sp. *Regaliz Orozuz*), a perennial plant (*Glycyrrhiza glabra*), a native of the south of Europe, but cultivated to some extent in England, particularly at Mitcham in Surrey. Its root, which is its only valuable part, is long, slender, fibrous, of a yellow color, and when fresh very juicy. The liquorice grown in England is fit for use at the end of 3 years; the roots, when taken up, are either immediately sold to the brewers' druggists, or to common druggists, by whom they are applied to different purposes, or they are packed in sand, like carrots or potatoes, till wanted. The roots of liquorice have been introduced into the middle and southern States, and have thus far been successful. From the increasing demands for this root, it is probable that it could be cultivated profitably. The amount annually imported (and manufactured), is valued at about \$300,000.

Liquorice Juice (*Succus Liquoritiæ*), popularly *black sugar*, the inspissated juice of the roots just mentioned. Very little of this extract is prepared in Britain, by far the larger part of our supply being imported from Spain and Sicily. The juice obtained by crushing the roots in a mill, and subjecting them to the press, is slowly boiled till it becomes of a proper consistency, when it is formed into rolls of a considerable thickness, which are usually covered with bay leaves. This is the state in which we import it. Most part of it is afterward redissolved, purified, and cast into small cylindrical rolls of about the thickness of a goose quill, when it is called *refined liquorice*. It is then of a glossy black color, brittle, having a sweet mucilaginous taste. It is used in the *materia medica*, particularly in colds, etc.—*Thomson's Chemistry*.

Lisbon, the capital of Portugal, situated on the north bank of the River Tagus, the observatory of the fort being in lat. $38^{\circ} 42' 24''$ N., long. $9^{\circ} 5' 50''$ W. Population about 240,000. The Moors are said to have given the name of Lisboa to this city when they conquered it, A.D. 716. It was made the capital of Portugal by Emanuel, 1506. Lisbon was almost destroyed by an earthquake, November 1, 1755. See *Earthquakes*. It became a point of the late war, and the court fled to the Brazils, November, 1807, in which month (the 30th) the French army under Junot entered Lisbon, and held possession of it until the battle of Vimeira, in which they were defeated by the British, under Sir Arthur Wellesley, August 21, 1808. Insurrection at Lisbon, August 21, 1831. Massacre at Lisbon, June 9, 1834. See PORTUGAL.

Port.—The harbor, or rather road, of Lisbon is one of the finest in the world, and the quays are at once convenient and beautiful. Port St. Julian marks the northern entrance of the Tagus. It is built on a steep projecting rock. There is a light-house in the centre, 120 feet above the level of the sea. At the mouth of the Tagus are two large banks, called the North and South *Chachops*. There are two channels for entering the river; the north or little, and the south or great channel, exhibited in the ordinary charts. On the middle of the South Chachop, about $\frac{1}{2}$ miles from Fort St. Julian, is the Bugio fort and light-house, the latter being 66 feet in height. The least depth of water in the north channel on the bar is 4 fathoms, and in the south, 6. The only danger in entering the port arises from the strength of the tide; the ebb running down at the rate of 7 miles an hour; and after heavy rains, when there is a great deal of fresh water in the river, the difficulty of entering is considerably augmented. When at such periods, there is a strong wind from the sea, there is a complete break all over the bar; vessels moor up and down the river with open hawse to the southward. In some parts they may come within 200 yards of the shore, being guided by the depth of water, which, from nearly 20 fathoms in mid-channel, shoals gradually to the edge.

Trade, etc.—Lisbon is one of the best situated commercial cities of Europe. But notwithstanding this circumstance, the excellence of the port, and the command of the navigation of the Tagus, her commerce is comparatively trifling. Lisbon has a royal manufactory of fire-arms and powder, and a cannon foundry; other manufactories comprise silks, porcelain, paper, soap, jewelry, and trinkets; none of these, except the last, is in a flourishing state. The despotism, intolerance, and imbecility of the government have weighed down all the energies of the nation. The law and police being alike bad, there is no adequate security. Assassination is very frequent. Industry of all sorts is, in consequence, paralyzed; and since the independence of Brazil, commerce has rapidly declined. Formerly Lisbon had about 400 ships, of from 300 to 600 tons burden, employed in the trade with South America. But at present there are not above 50 ships belonging to the port engaged in foreign trade; and, of these, the average burden does not exceed 150 tons! The produce of Portugal sent to foreign countries, is almost entirely conveyed to its destination in foreign ships. The trade between Lisbon and Cork, is, we believe, the only exception to this; it being principally carried on in Portuguese vessels, which take salt from St. Ubes, and bring back butter in return. About 200 small craft belong to the city, which are exclusively employed in the coasting trade. There are neither price currents, shipping lists, nor official returns of any kind, published in Lisbon. The principal exports are lemons and oranges— which, however, are very inferior to those of Spain; wine, particularly Lisbon and Calcavella; wool, oil, tanned hides, woolen caps, vinegar, salt, cork, etc.

Besides colonial produce, the principal imports consist of cotton, woolen, and linen goods; hardware, earthenware, dried fish, butter, corn, cheese, timber and deals, hemp, etc.

Money.—Accounts are kept in rees, 1000 of which = 1 milree. In the notation of accounts the milrees are separated from the rees by a crossed cypher (θ), and the milrees from the millions by a colon; thus, Rs. 2:700 θ 500 = 2,700 milrees and 500 rees. The crusado of exchange, or old crusado = 400 rees; the new crusado = 480 rees; the testoon = 100 rees; and the vinten or vintem = 20 rees. The gold piece of 6,400 rees = 85s. 11d. sterling; the gold crusado = 2s. 3d.; and the milree, valued in gold = 67 $\frac{1}{2}$ d. sterling. It appears, however, from assays made at the London mint, in 1812, on modern silver crusados, that the average value of the milree in silver may be estimated at 60d. or 5s. sterling. **Weights and Measures.**—The commercial weights are, 8 ounces = 1 marc; 2 marcs = 1 pound or arratel; 22 pounds = 1 arroba; 4 arrobas = 1 quintal; 100 lbs. or arratels of Portugal = 101.19 lbs. avoirdupois = 45.895 kilogrammes = 94.761 lbs. of Hamburg = 92.918 lbs. of Amsterdam. The principal measure for corn, salt, etc., is the moyo, divided into 15 fanegas, 30 alquieiras, 240 quartos, 480 selemis, etc. The moyo = 23.03 Winchester bushels. The principal liquid measure is the almude, divided into 2 potes, 12 canadas, or 48 quartellos; 18 almudes = 1 baril; 26 almudes = 1 pipe; 52 almudes = 1 tonelada. The almude = 4.37 English wine gallons; and the tonelada = 227 $\frac{1}{2}$ ditto. A pipe of Lisbon is estimated by the custom-house (British) at 140 gallons; and this pipe is supposed to be 31 almudes. A pipe of port is 160 gallons, divided into 21 almudes of Oporto. Of measures of length, 2 pes = 3 palmos = 1 covado, or cubit; 1 $\frac{1}{2}$ covados = 1 vara; 2 varas = 1 branga. The pe or foot = 12.944 English inches; 100 feet of Portugal = 107.8 English feet; the vara = 43.2 English inches. For freight a last is reckoned at 4 pipes of oil or wine, 4 chests of sugar, 4000 lbs. of tobacco, 3,600 lbs. of shumac. But from one place in Portugal to another, a tonelada is reckoned at 52 almudes of liquid, or 54 almudes of dry goods. Coffee is sold per arraba; cotton, indigo, and pepper, per lb.; oil, per almude; wine, per pipe; corn, per alquiere; salt, per moyo. Grain, seed, fish, wool, and timber are sold on board. Weights and long measures are the same throughout Portugal; but there is a great discrepancy in the measures of capacity. The almude and alquiere, at the principal places, are in English measures as follows: Lisbon almude = 5.37 gals. English wine measure; Lisbon alquiere = 8.07 gals. Winchester measure; Oporto almude = 6 $\frac{1}{2}$ gals. wine measure; Oporto alquiere = 8 $\frac{1}{2}$ gals. Winchester measure; Faro almude = 4 $\frac{1}{2}$ gals. wine measure; Faro alquiere = 3 $\frac{1}{2}$ gals. Winchester measure; Figuiera almude = 5 $\frac{1}{2}$ gals. wine measure; Figuiera alquiere = 3 $\frac{1}{2}$ gals. Winchester measure; Vianna almude = 6 $\frac{1}{2}$ gals. wine measure; Vianna alquiere = 3 $\frac{1}{2}$ gals. Winchester measure.

Bank of Lisbon.—This establishment was founded in 1822. Its capital consists of about £700,000 sterling, divided into 7000 shares. The shareholders are not liable beyond the amount of their shares. The bank discounts bills not having more than 3 months to run, at 5 per cent. Its dividends, at an average of the 3 years ending with 1831, were about 6 per cent. It enjoys the singular but valuable privilege of having its claims on all estates paid off in full, provided the estate amounts to so much; other creditors being obliged to content themselves with a division of the residue, if there be any.
